* NOTE.—The full lists of individuals and organisations which sent memoranda to the Taxation Enquiry Commission are published at pp. 301-315 of Part I of this Volume (Appendices A and B). Due to lack of space it has been possible to print only a few of these replies here.

†Replies of (i) Federation of Indian Chambers of Commerce and Industry and (ii) Associated Chambers of Commerce of India, are published in Part I of this Volume.

The Bengal Chamber of Commerce and Industry, Calcutta.

REPLIES TO THE QUESTIONNAIRE OF THE TAXATION ENQUIRY COMMISSION.

PART I.—THE TAX SYSTEM

GENERAL.

Question 1.—*What, in your opinion, should be the objectives of a sound tax policy?*

In the opinion of the Chamber, the main objective of a sound taxation policy is fiscal effectiveness and efficiency; in other words, the collection within the limits of State social and economic policies, of finance sufficient for the government of the country, its security, efficient administration and development. In present and foreseeable conditions in India, however, fiscal efficiency does not cover only the yield of taxation but, to an increasing degree, involves considerations of the effect of taxation on the future level of enterprise. In the opinion of the Chamber, a sound taxation policy is one which while yielding adequate returns in the present at the same time gives encouragement to the rapid development of enterprise in the future. These objectives are regarded as essential; the others referred to are incidental and are to a large extent attempts to implement through the taxation system social or economic policies which as such have no direct connection with it.

Question 2.—*What should be the place in such a policy of the following objectives?*

- (a) *Reduction in inequalities of income and wealth.*
- (b) *Encouragement of incentive to work to save and to invest.*

The Bengal Chamber is of the opinion that it is impossible to consider objectives (a) and (b) independently as the one has a direct bearing on the other. It is, therefore, proposed that (a) and (b) should be considered together.

Having accepted a mixed economy as the most suitable for the development of India during the currency of the Five Year Plan, Government have placed on the private sector the onus of providing Rs. 233 crores for new industrial investment and Rs. 150 crores for making good arrears in depreciation. If the private sector is to play its part to this extent in furthering the development of the country Government will, it is contended, have to approach the whole problem of taxation with the minimum of political idealism and in a bold and realistic manner.

The problem that is uppermost in everybody's mind in India today is that of unemployment. In a country of 360 million, with an annual increase in population of 4½ million, it is necessary that the tax policy should be so devised as to create conditions whereby the increased population will be readily found employment. India is and will remain predominantly an agricultural country but already the pressure of man upon the soil has become such that, without a sustained improvement in agricultural output, it cannot produce enough food to satisfy even the regrettably low standards at present accepted by its people. The remedy lies in rapid expansion of industry.

The view is held in some quarters that redistribution of wealth is a solution to the problem of mass poverty, but this ignores the truth that wealth can create wealth, whereas poverty breeds only poverty. And it is at this point unfortunately that idealism and sound economic reasoning come to the parting of the ways. Taxation may well take away from the rich in India but it does not yet give to the poor, for no social services of any consequence are provided by the State and the development projects partly financed by taxation (which it may be argued will ultimately raise the standard of living of the poorest) are not yet in productive operation. The concept that wealth in the hands of an individual or a company is unjustifiable when so many others are facing poverty and distress is one that finds sympathy in some political circles, but it is submitted that such a view at this juncture in India's development is unrealistic. An examination of industrial development in highly industrialised countries goes to show that in nearly all cases industries have grown out of comparatively humble beginnings due to the foresight, courage and ability of comparatively few individuals. In nearly every instance expansion of such industries has been due to re-investment of profits which individuals and companies have been allowed to earn and retain, backed by the financial support of a public with an investible surplus which has had confidence in such leadership. That is the climate in which industrial development can make rapid advance, fresh wealth be created and employment found for men in all walks of life.

The Bengal Chamber feels that only by creating opportunities for employment can the standard of living

be raised and the objectives of the Five year Plan be achieved wherein 800,000 to 1,000,000 people are to be provided with new employment annually. If substantial industrial expansion can be achieved it will have an effect on agricultural output. The increase in earnings of those newly employed will create a purchasing power which should in turn stimulate the demand for agricultural products. It is submitted that the present taxation policy so far from encouraging this objective has since 1947 stultified it. The provisions of that year's budget, framed to meet particular circumstances, put a noose round the neck of India's industrial leaders, out of which have slipped only those who were prepared to play outside the rules. Today these are the only men who are in a position to make a substantial contribution in the private sector, but the question naturally arises whether the country's future in that sector will be best served if development in it is left exclusively to this section of industrialists, many of whom are in effect financiers and men with no intimate knowledge of industrial affairs.

There appear to be only two alternatives by which Government can achieve its object: a wide scale extension of Government participation in industry or an entirely fresh approach to the tax problem with a view to encouraging the best talents and enterprise which are available to the country in the private sector and which could serve it well if they are only allowed to function under conditions which make industrial expansion safely possible. For Government to adopt the first alternative would be unwise for many reasons. First of all the machinery of Government is too cumbersome to adapt itself easily to the quicker tempo of competitive industry. Then there is a great dearth of technical and administrative talent surplus to Government's primary responsibilities; and finally the totalitarian methods of other countries would hardly be acceptable to the India of today.

There remains therefore the other alternative, namely giving to the best elements in the private sector scope to work for the country's good as free as possible from Government intervention and with incentives proportionate to the risks that are inseparable from rapid industrial expansion. This could be quite simply achieved by suitable modifications in the present tax structure for both companies and individuals (accompanied by swifter and harsher penalties for evasion). The threat of the increase in population must be met, and the Chamber is emphatic that levelling down is not the answer; even complete re-distribution of wealth would bring such infinitesimal and momentary relief that this as an approach to the tax problem should be summarily discarded. Instead it is suggested that the Commission should seek ways and means of encouraging expansion in the private sector by designing a tax policy which will bring about a favourable climate for producing fresh wealth and fresh avenues of employment in a country in which there is no time for delay and in which should be no shirking a realistic approach.

(c) *Countering of inflationary and deflationary tendencies:*

Taxation policy is an instrument of only limited effectiveness in countering inflationary and deflationary tendencies, particularly in India where the total number of direct taxpayers is so small a proportion of the total population. It is uncertain, it is slow, and it is productive of inequity and anomalies. At a certain stage—and the Chamber believes this stage has already been reached—high rates of taxation imposed for the purpose of reducing inflation defeat their own objects, for not only do they discourage hard work and enterprise and thus accentuate the storage of goods which is one of the causes of inflation, but they promote irresponsible spending on the part of industry and encourage taxpayers to seek means of divesting themselves of taxable income. As a means of combating inflation or deflation therefore, taxation is an instrument which should be used with the greatest care and circumspection, and the Chamber considers that it is only in a state of great emergency that it should be so used. The great increases in personal and corporate taxation during the period 1940—1947 helped to keep a well-developed inflationary situation in India under control. Unfortunately the rates then imposed have since come to be regarded as the norm. In general and in normal circumstances the Chamber does not consider that this is an important objective of the tax system.

(d) *Maintenance of the external balance of the economy:*

The use of taxation for the maintenance of the external balance of the economy presumably involves the imposition of import and export duties. The

Chamber does not consider that Customs duties are an appropriate means of achieving a balance in external payments, for experience has shown that they are uncertain in their effects and indeed as often as not produce results which are entirely unlooked for and may well be contrary to those which it was intended to achieve. Commerce like nature abhors a vacuum and if attractive operations for trade present themselves, unscrupulous traders have not been slow to find some means of evading fiscal barriers that may be placed in their way. The export duties which were imposed on jute goods during the post-devaluation shortage illustrate the Chamber's contention that an impost which was introduced with the most laudable objects has not only failed to achieve those objects but has seriously damaged the present position and future of the jute trade which is the country's most important source of export earnings.

General.

Summing up its views on the objects of taxation specified in this question, the Chamber would say that, subject to the fulfilment of the basic objective of raising finance efficiently and with least pernicious effects, the encouragement of incentive to work, to save, and to invest should be a first charge upon taxation policy; that, subject to certain very severe limitations, the maintenance of the external balance of the economy can be partially regulated by fiscal measures; that, particularly in India, taxation is not an effective means of combating inflation or deflation; and that a reduction in inequalities of income and wealth by means of tax policy is a positive hindrance rather than an aid to the country's economic development and will eventually destroy the main source of revenue from direct taxation.

The Chamber's proposals for modifications in the tax system will be evident from its more detailed replies to later part of this questionnaire. Broadly, however, and in line with the views expressed above, the Chamber considers that the tax structure should be remoulded in two main ways:—

- (a) To promote industry, saving and investment, it is necessary to reduce the burden of taxation on industry and on those members of the professional, managerial and investing classes who form part of the middle and upper income groups;
- (b) To raise the finance required for the country's development plans, and to distribute the burden more equitably, it is necessary to cast the taxation net more widely and, in particular, and in the context of India's economic circumstances, to make an increased resort to indirect rather than direct taxation.

Question 2.—What criteria would you suggest for determining the equity of a tax system? How far is it possible to secure it in the Indian tax system?

Question 3.—Does the Indian tax system conform adequately to the principle of ability to pay or do you think an extension of this principle is desirable and practicable? If so, in what ways?

Question 4.—Differing views have been expressed on the extent to which the taxable capacity of various sections of the community has been used by the Indian tax system. What is your view on the subject?

Question 5.—The proportion of tax revenue to national income in India is considered small relatively to several other countries. Do you think this proportion can be raised, and, if so, what tax changes would you suggest for the purpose?

Question 6.—Do you think that the relative place of direct and indirect taxes in the Indian tax system is satisfactory?

Answer to Questions 2 to 6:

A taxation system is equitable if it ensures that those who benefit from public expenditure contribute to the funds which are available for that expenditure and that at the same time the burden of taxation takes reasonable account of capacity to pay. In the Chamber's opinion, the present system of taxation in India does not satisfy either of these criteria. A very large part of the public income from taxation is earmarked for development projects but the burden of taxation hardly touches those sections of the community who will derive the main benefits from these projects; on the contrary, the burden is concentrated on a relatively small class—the class which will receive least direct benefit from contemplated public expenditure. This no doubt conforms to a certain extent to the principle of assessing on the basis of ability to pay, but nevertheless the Chamber considers that the capacity to pay of the mass of the population is greatly underestimated. Further, with so large a population there can be a considerable extension of the field of taxation, the incidence of which on the individual would be negligible.

The Chamber considers that there is ample scope for extending the incidence of taxation; and it believes

that the means of achieving a wider application of the tax burden is a resort to increased indirect taxation as opposed to direct. In India, with its vast population and correspondingly vast consuming market, indirect taxation has the great virtue of enabling considerable sums to be raised by means of impositions which in themselves are relatively slight. Though the standard of living is still low by Western conditions, the money income of the masses has indubitably increased to a very large extent over the last decade, as witnessed by the increased consumption of consumer goods and the decrease in rural indebtedness. A few annas a month payable in indirect taxes would now-a-days mean little in the budget of the average individual.

Question 7.—Do you consider that non-tax revenues are likely, in future, to occupy a more important place than hitherto in the public revenues of India? If so, please state the sources of non-tax revenue you have in view and indicate to what extent they may be expected to contribute to the public exchequer.

The revenue accruing from sources other than taxation must obviously depend on the extent of State participation in commerce, in industry and in public utilities. It therefore raises questions of political and economic theory which do not properly come within the scope of an enquiry into taxation. The Chamber would make the obvious remark however that, as the field of State participation in all industry widens, so must the private sector diminish; and so consequently must private earnings decrease as a source of taxation revenue. To a large extent, therefore, an extension of State enterprise involves merely a process of transferring wealth from one hand to the other; the revenue accruing from the taxation of the private sector disappears and is replaced by the profits of State-managed enterprises.

The sources of non-tax revenue are well known: railways, the recently nationalised airways, the posts and telegraphs, hydro-electric schemes and Government projects such as the Sindri Fertiliser Factory. In the case of the more modern and recent of these, such as the hydro-electric projects, there is no doubt that in due course they will provide a solid and substantial source of revenue; in their initial stages, however, they must inevitably involve a liability rather than an immediately productive asset, and there must accordingly be a time lag between their commencement and their development into revenue-producing investments. The Chamber is unable to make an assessment of the extent to which these sources may in due course be expected to contribute to the public exchequer. It seems that in actual practice and for the reasons given in reply to Question 10 such contributions will be small.

Question 8.—Do you agree with the view that receipts from particular taxes should not, as a rule, be funded or earmarked for specific purposes?

Whatever may be the theoretical position, the Chamber considers that practical experience has shown that it is a mistake to earmark the receipts from particular taxes for specific purposes. The system is too open to abuse and in practice it is only too common for hard-pressed Governments to raid these funds and divert them from the specific purpose for which they were originally constituted. Generally speaking, therefore, the Chamber is opposed to the funding of tax receipts; and, if the practice must be resorted to, it should be only in special circumstances, it should be only after a very careful examination of the merits of the particular case involved, and it should be subject to a strict adherence to the principle that the funds must not be diverted from their original purpose.

Question 9.—Do you think that it is desirable, under certain conditions, to levy cesses for special purposes?

What has been said in the foregoing reply on the question of the funding of particular taxes also applies to a certain extent to the imposition of cesses for special purposes. In this instance, however, the objections are perhaps not so strong and, subject to their circumspect application and use, cesses can play a useful part. Unless strict control is applied, the imposition of cesses on an industry can become a penal burden. An example of the unbridled use of cesses is the situation in the coal industry where the following cesses and exise duties are imposed.

Cesses on Coal.

1. **Stowing Excise Duty.**—On coal and coke despatched by rail from India excluding Assam and Punjab:

(i) on coal and soft coke @ Rs. 0-6-0 per ton;
Rs. 0-9-0 from 10-5-51.

2. **Rescue Excise Duty.**—On coal and coke despatched by rail from Jharia and Raniganj fields=Rs. 0-0-2½ per ton.

3. **Labour Welfare Cess.**—31st December 1944. On coal and coke despatched by rail from whole of India=Rs. 0-6-0 per ton; i.e. 0-4-6 for Welfare Fund and 0-1-6 for Housing Board.

do. for 12 months from 1-4-1951. Rate altered to 0-4-8 for Welfare Fund and 0-1-4 for Housing Board.

Railway collecting fee from 1-4-47 standardised at 2 per cent. It was 5 per cent., 7½ per cent. and 3 per cent. in respect of 1, 2 and 3 above, previous to 1-4-47.

4. *Hazaribagh Mines & District Board*.—Cess Rs. 0-1-6 per ton of annual despatches of coal and coke from mines. (On average of 3 years.)

Rs. 0-1-0 of each rupee of annual nett profits on mines (on average of 3 years despatches) provided aggregate of local cess so levied does not exceed Rs. 0-3-0 per ton of annual despatches of coal and coke. (Bihar Cess Amendment) Act, 1936, Section 6B.

5. *Hazaribagh District*.—(Bihar Gazette Notification No. 3082, dated 22-3-50.)

(1950) Local Cess 0-2-0 per rupee of the annual value of lands.

6. *Jharia Mines Board of Health*.—Tonnage Cess: 1953-54—Rs. 4-6-0 per 100 tons of coal raised.

Royalty Cess: 1953-54—30 per cent. of the road cess payable.

7. *Jharia Road Board Cess*.—Rs. 0-1-0. Calculated at Rs. 0-1-0 per rupee on profits of the Colliery Company. The rate of cess of the despatches of coal and coke from mines under Section 1 on Section 6(c) on the Bihar Cess Amendment Act, 1936 for the ensuing year was fixed at 0-5 pies per ton.

8. *Manbhum District Cess*.—On tonnage—nil.

On profits—Rs. 0-1-0 per rupee on average nett profit of previous 3 years.

9. *Bengal—Primary Education Cess*.—Under the Bengal (Rural) Primary Education Act, 1930, Section 29(2), a cess of 10½ pies on each rupee of annual nett profits from mines and 15 pies on annual value of land. This is now extended to Burdwan.

10. *Jharia Water Board*.—Tonnage Cess—1952-53—Nine pies per ton on despatches of coal.

Royalty Cess—1952-53—Five per cent. on the amount of Royalty received during the calendar year 1951.

11. *Bihar District (excluding Hazaribagh)*.—(Bihar Gazette Notification No. 3401, dated 30-3-50.)

(1920) Local Cess 0-2-0 per rupee of the annual value of lands.

12. *Excise Duties under the Coal Mines (Conservation and Safety) Act, 1952* fixed with effect from 8th January 1952—

(1) 6 as. per ton on all coal including soft coke but excluding hard coke,

(2) 9 as. per ton on hard coke.

13. *Asansol Mines Board of Health*.—Tonnage Cess—1953-54—Rs. 4-0-0 per 100 tons of coal raised.

Royalty Cess—1953-54—fixed in due proportion to meet the expenditure of the Board for the year ending 31st March 1954.

Question 10.—*State undertakings, commercial, industrial, etc., are coming to play an increasingly important part in the economy of the country. Have you from the point of view of their significance as a source of revenue, actual or potential, any comments or suggestions to make on matters such as the further extension of State undertakings and their policies in regard to pricing, in so far as these may be relevant to tax policy?*

The remarks which the Chamber has made in reply to Question 7 have a bearing on this question. If there is an extension of State enterprise there may be a corresponding reduction in the taxable capacity of the private sector. Where State enterprises do operate, however, it is essential in the Chamber's opinion that they should be conducted according to the best and most sound commercial practices. Generally, State undertakings enjoy monopoly advantages and it is, therefore, often difficult to determine if they are economic or are efficiently run. Similarly, it is difficult to pass an opinion on their price policies, for as monopolists they are often in a position to charge prices which could not be maintained in a market subject to normal commercial competition. In view of these monopolistic advantages, the Chamber would suggest that, broadly speaking, State enterprises should not usually be expected to earn high profits and that if they do there are grounds for suspecting that their prices are too high and that they are in fact exploiting their monopoly at the expense of the consumer.

In fact in present circumstances the tendency is for rates to be kept on the low side in order to safeguard those concerned from the political odium of profiteering or of increasing the already high cost of living. Apart from this and in contrast with private enterprise where the willingness to assume responsibility and to take discriminating risks are highly valued and produce their own reward, State enterprise seems to be synonymous with a reluctance on the part of officials, particularly in the middle grades, to accept responsibility or use initiative. It is inherent in Government undertakings that they cannot be operated as economically or as

efficiently as commercial concerns. The executive handling Government money cannot act with the speed and freedom of his opposite number in commerce. Further, incentive is less. In the lower ranks the feeling of security in Government service and the knowledge that there is in the background a large purse from which losses can be recouped, the absence in the first place of the spur of competition, and in the second of the fear of unemployment all play their part in reducing the efficiency of State undertakings and neutralising their capacity to produce large profits for the State revenues. Finally, the development of State enterprise in this as in other countries seems inevitably to mean that the interests or industries concerned are to an increasing extent guided not by persons with expert knowledge of their specialised problems but by men who, quite apart from a total lack of practical experience in the particular directions concerned, have often little knowledge of other development projects.

These inherent disadvantages, which appear to be encountered wherever the policy of nationalisation is introduced, in the opinion of the Chamber make an extension of State undertakings which are an encroachment on the private sector undesirable not only on general grounds but particularly because they support the view that this section of enterprise is most unlikely to make any considerable contribution to the public revenues.

Question 11.—*Would you suggest that the net surplus earned by State undertakings should accrue to general revenues or be carried to a fund for financing projects of development or be re-invested in the undertakings concerned?*

In reply to the foregoing question, the Chamber has stated that State enterprises should conform to ordinary commercial practices. The first charge on their earnings should, therefore, be the maintenance of their capital intact and such reinvestment of profits as would be advisable in the case of a well-managed company in the private sector. The Chamber is opposed, however, to the idea that State enterprises should earn a substantial revenue which will supplement the State's income from taxation. If they do earn such a surplus, then, after their own depreciation, tax liabilities and re-investment requirements have been met, the balance should be carried to the general revenues; it should not be used as the basis of a special fund for financing other development projects.

Question 12.—*In examining the incidence of taxation on various classes of people, which of the following factors singly or in combination would you suggest as the basis of differentiation?*

- income,
- occupation,
- rural or urban residence?

Is there any other basis which may be considered?

The Chamber has not sufficient information of the specialised statistical nature required to reply usefully to this question.

Question 13.—*Do you think that the burden of the present tax system—Central, State and Local—is fairly distributed among—*

- Various classes of people?

As will be evident from earlier answers, the Chamber does not consider that the burden of taxation is fairly distributed among the population. The Chamber would in this respect remind the Commission of the analysis made by the Planning Commission in the First Five Year Plan (Chapter III, page 49) as follows:—

“About 28 per cent. of the total tax revenue comes from direct taxation which directly affects only about half of 1 per cent. of the working force . . . Another 17 per cent. is accounted for by import duties, a considerable part of which is derived from taxation of commodities like motor vehicles, motor spirit and oils, high quality tobacco, silk and silk manufactures, liquors and wines, etc., which affect but a relatively small section of the population. A large proportion of the excise duties on tobacco and cloth which yield about 8 per cent. of the total tax revenue is also probably paid by the limited number of consumers who use the better varieties . . . But if as much as one-third or more of total tax revenue is derived from certain limited strata of society, it implies that the burden of taxation spread over the rest of the community is correspondingly lighter . . .”

The largest sectors in the community—the agriculturist and the workers in industry—are practically exempt from taxation and almost the entire burden is inequitably concentrated on trade and industry and on the small section of middle-class society, professional workers, the managerial class, the business community, etc.

- Different States?

The Chamber has no opinion to express regarding the distribution of taxation among the States.

Question 14.—Have shifts in the distribution of income in the community in recent years altered the relative incidence of taxation on various classes of people? If so, to what extent?

The shifts in the distribution of income, which have not escaped the notice of the framers of the questionnaire and which have been referred to in the Chamber's reply to questions 2 to 6 above, have not been accompanied by appropriate alterations in the incidence of taxation, and this is the basis of the Chamber's contention that an extension of the field of taxation, particularly indirect taxation, is more than justified.

Question 15.—Do you think that the cost of compliance with tax regulations adds materially to the burden of taxation? If so, in respect of what taxes? Please give details.

The Chamber is emphatically of the view that compliance with tax regulations has added a quite disproportionate amount of work at all levels in industry and commerce. It has been found that the number of qualified Chartered Accountants whom it is now necessary to employ to supervise the compilation of tax returns has increased substantially since the war and there has been a proportionate increase in clerical and other staff directly engaged. Such staff is largely engaged in unproductive work and its employment has therefore added very substantially to business overheads without a corresponding advantage of any sort to the employer. The outstanding difficulties are caused by income tax returns, but sales tax is also responsible for a great deal of work and those industries which are the subject of excise duties face similar problems.

Question 16.—Do the benefits accruing from public expenditure have a bearing on a consideration of the burden of taxation? If so, how would you take this into account in considering the burden of Indian taxation?

The Chamber has already stated that those who benefit from public expenditure should also contribute to the funds available for that expenditure. Any useful examination of the burden of taxation must, therefore, necessarily involve an enquiry into the benefits conferred by public expenditure.

Question 17.—Do you think that the tax burden weighs particularly heavily on any individual industry or occupation? If so, please furnish the Commission with the evidence on which you rely?

It is the Chamber's contention that the tax burden weighs unduly heavily on industry and commerce as a whole, as opposed to the general population and in particular to the agricultural classes on whom the burden falls very lightly. Within industry there are undoubtedly certain sections which are penalised to a special degree. For instance, undertakings engaged in the exploitation of wasting assets, such as minerals, receive no special consideration, with the result that they have greater difficulty than other enterprises in maintaining their capital intact. Again, Government's practice of intervening in the affairs of an industry, by the imposition of special fiscal measures in order to meet a temporarily abnormal situation, frequently results in that particular industry being placed at a disadvantage while the additional impositions are in force; thus the exceedingly high export duties which were imposed on jute goods during the post-devaluation shortage, and which have not yet been totally abolished, have very gravely penalised the jute industry and still constitute a serious threat to the industry's trading prospects. The evidence for the Chamber's views in this regard will be found in the published results of Companies' and Directors' reports, which show only too often how large a portion of income is taken away in taxation, making it difficult for the companies to maintain a sound financial position or to show satisfactory working results.

Taxation and Economic Development.

Question 18.—What role would you assign to taxation vis-a-vis various types of borrowing in finding the additional resources required for the development programme of the country?

The Chamber considers that the capital requirements of development work can legitimately be met by borrowing, and they are strongly of the opinion that as far as possible resort should be had to this method of finance in order to lighten the crushing burden of taxation.

Question 19.—In maximising the resources required for the financing of development what degree of importance would you assign to:

- (a) prevention of tax avoidance and tax evasion,
- (b) economy and rationalisation in expenditure,
- (c) higher rates of existing taxes,
- (d) fresh taxes,
- (e) development of non-tax revenues?

Of the means of maximising tax revenue which are specified in this question, the Chamber considers that attention should be concentrated on the following three methods, which are given here in the order of importance attached to them by the Chamber—

(a) *Prevention of tax avoidance and tax evasion:*

In the Chamber's opinion, tax evasion on a very large scale has been encouraged and stimulated by the heavy rates of taxation which are now in force and by the multitudinous controls which Government exercise over the affairs of commerce and industry. Whatever may be the merits of any taxation system as such, it is certain that it cannot work to the best effect unless it is enforced rigorously and uniformly. The Chamber has no hesitation in saying that the revenue accruing from existing taxation could be very greatly increased by an energetic enforcement drive. A campaign against tax evasion and black marketeers is, therefore, the most important requisite if the proceeds of taxation are to be increased to a maximum. Finally, and this is perhaps the most important consideration of all, tax evasion on the scale practised during recent years adds to the feeling of frustration by the honest taxpayers, places a premium on dishonesty and encourages a dangerous disrespect for the taxation laws.

(b) *Economy and rationalisation of expenditure:*

The Chamber thinks it is quite impossible to assess the importance of the additional funds which might be produced by economy and rationalisation of expenditure in the various Government Departments concerned. There is ample evidence, however, in the public discussions on State expenditure, particularly those relating to the multi-project dams, etc., to indicate that constant supervision, particularly in these new fields of development, is required if there is not to be waste and extravagance. At the same time, there have been many complaints that financial control is too rigid and highly centralised and ultimately defeats its own objects. It is clear that with the larger Government expenditures envisaged under the development programme, this aspect of financial control must attain increasing importance.

(d) *Fresh taxes:*

The Chamber strongly advocates the imposition of fresh taxes in the sense of extending the field of taxation so as to cover the entire taxable resources of the country and bring within the orbit of contribution that very large section of the population which is at present almost exempt from taxation. As has been recommended earlier, the means of achieving this object is an increased reliance upon indirect as opposed to direct taxation; and the Chamber would suggest here—its proposals are worked out in greater detail in replies to later sections of the questionnaire—that the most efficient, equitable and productive form which indirect taxation can take is a more widespread and uniform sales tax which will apply to all commodities in general consumption.

The other two methods of increasing revenue which are mentioned in this question should not be restored to. Existing taxes already bear very hardly on those who have to pay them and are a serious impediment to capital formation and to the health of the private sector of trade and industry; they should therefore be reduced. As regards non-tax revenues, the Chamber has already submitted that Government projects should not be regarded as a means of raising finance to supplement the public income from taxation.

Question 20.—Under the Five Year Plan the public sector is expected to undertake a larger investment; an important place is also assigned to the private sector in the development programme. How would you devise a tax policy suitable to the development programme of the country in both sectors?

Question 21.—What part can tax policy play in stimulating capital formation in the private sector consistently with the needs of the public sector?

The Chamber's proposals for the financing of developments under the Five Year Plan are, firstly, reduction in the direct taxation of companies and of the investing classes, combined with incentives towards industry, saving and investment; and, secondly, an increased resort to indirect taxation so as to distribute the burden equitably and to tap all legitimate sources of public revenue.

The reduction in direct taxation which the Chamber advocates and the offer of incentives are essential if private saving is to be encouraged and the private sector of the industry enabled to undertake the heavy investment required by it under the Five Year Plan. As a means of promoting investment and the ploughing back of profits into industry, the Chamber would recommend that the Commission should investigate the possibility of making provision for development funds to be constituted by the re-investment of company profits which, on the condition of their being utilised for legitimate and approved development projects, would be exempt from taxation or the subject of substantial tax relief. The Chamber has already commented on the pernicious effects resulting from the levelling down process which is involved in the present system of taxation; it would submit that, as opposed to this steady attrition of the country's investment potentialities, the proposed reduction in direct taxation and grant of incentives to investment would constitute a dynamic taxation policy which would not only re-invigorate trade and

industry and solve many of the country's economic problems—under-development, unemployment, and the absence of indigenous manufactures—but would also in the course of time result in the cumulative production of new wealth and new sources of taxation.

As indicated, the Chamber considers that to collect in future the finance necessary not only for ordinary administrative purposes but for development of the public sector (to the extent that such finance is to be obtained through taxation) increasing emphasis should be placed on indirect taxation with a lowering of the burdens placed at present upon the direct tax-paying classes. The Chamber thinks that this policy is consistent not only with the stimulation of capital formation in the private sector but also provides a satisfactory method for expanding development in the field of public development. The latter to a very great extent meets the needs of, or consists of expenditure which will benefit, the public at large, particularly including those sections on whom the incidence of taxation is at present negligible, and the Chamber considers it equitable that the community as a whole should be more directly involved than it is at present in producing the finance necessary for those projects.

Question 22.—(i) *Is there evidence for the view that the rate of private capital formation in the community has been lower in the last few years as compared to the pre-war period? What factors in your opinion account for the decline?*

There is evidence on every side that industry to-day finds difficulty in raising finance not only for new concerns but for replacing or rehabilitating existing plant and an examination of company accounts will show that industrial operations are now conducted on bank advances to a far greater extent than in pre-war years. The decline in private capital formation and investment is particularly evident from the results of the recent investigation into the working of the first two years of the Five Year Plan, which has shown that the private sector of the economy is falling far short of the investment targets set for it under the Plan. This situation is the result of penal rates of direct taxation which not only leave little resources for capital formation but positively discourage hard work and saving. A system of direct personal taxation which increases steeply as taxable income becomes larger amounts almost to special discrimination against savings, investment and enterprise, for it is the marginal increments of income which are earned by extra effort which form a source of investment; it is precisely on those marginal increments that a graduated direct tax bears most heavily. The entrepreneur or the salaried employee works a little harder so that he may earn a little more, and it is that little more that constitutes a source for saving and investment; under the existing tax system, however, it is this "little more" that attracts the highest rate of taxation; and such a very small proportion of the increment is left to the earner that all incentive to hard work or saving disappears.

(ii) *Has there been a shift in recent years in the sources of capital formation in the private sector as between individuals, corporations and other institutions?*

It is a truism that one result of high taxation is the encouragement of tax evasion and this has been very evident in India during the post-war years. The honest tax-payer has been left with little or nothing to invest and the funds which are available for investment are often money in the hands of the tax evader whose sources are dubious. There has, therefore, been a shift in the sources of capital formation from the honest to the dishonest, and a continuance of the present structure of taxation can only mean that in future the country will have to look to the tax dodger and the blackmarketeer rather than to the honest and responsible citizen for its capital investment. The multiplicity of social welfare schemes and the "security minded" consciousness which they engender has also involved a shift in the sources of capital formation; the small private investor is no longer the backbone of the capital market and the greater part of investment now derives from provident funds, insurance companies and similar institutions whose funds are not available for new risk investment.

Question 23.—*Do you think that tax relief in respect of persons in the middle-income group would assist the growth of savings or mainly promote consumption?*

The Chamber thinks it probable that the grant of tax relief to the middle-income group would result both in increased consumption and increased savings. Increased consumption is not in itself undesirable, for an expanding economy must find its markets and if the country is to industrialise there must be more consumers. There would certainly be larger savings which could probably be increased by skilful and vigorous publicity campaigns and no doubt the experience of Government in conducting the Small Savings movement will be of assistance in this regard.

Question 24.—*The Planning Commission have given an estimate of the rate of progress in regard to*

national income and consumption standards on the assumption of 50 per cent. of the additional output going into investment each year after 1956-57. What measures in the field of taxation are necessary if this assumption is to be realised?

It must be difficult under any circumstances to make an accurate estimate of the kind that has been attempted by the Planning Commission, but the Chamber is inclined to the view that, at the present rate of progress of the Five Year Plan, the Commission's estimate of an investment of 50 per cent. of additional output is decidedly over-optimistic. Certainly the Chamber does not think that such an object will be achieved without the adoption of the tax modifications it has proposed: a reduction of direct taxation, incentives to savings and enterprise, and an extension of indirect taxation.

Question 25.—*Do you accept the view that some regulation of consumption standards is desirable as a means of releasing larger resources for development? If so, what part, in your view, can tax policy play in this process and what should be the relative role of direct and indirect taxes in achieving the purpose?*

The Chamber thinks that the main emphasis towards development should and must come from an overall expansion of production which will allow some of the additional resources to be devoted to capital investment rather than that development should be secured by a diversion of consumption. It is, therefore, strongly opposed to any physical regulation of consumption, the difficulties and disadvantages of which were amply demonstrated during the period of war and post-war controls. It is appreciated, of course, that the greater resort to indirect taxation which they propose may in theory involve some diversion of consumption, but it is considered that the incidence of such taxes taken over the population as a whole would be so low that their effect on individual physical consumption would not be large although the total resources involved might be so.

Question 26.—*How far can tax policy help to promote the efficiency of the productive system? Do you think that multiplicity of taxes in India in respect of the same commodities and their lack of uniformity from State to State affect the allocation of resources in the community and hence the efficiency of the economy? Have you any suggestions for the rationalisation of the country's tax structure in these respects?*

The Chamber considers that a system of taxation modified on the lines it has advocated in reply to earlier questions would assist the efficiency of the production system; certainly it would impede that efficiency to a far less degree than does the present tax structure. The multiplicity of taxes and differences from State to State do, in the Chamber's opinion, hamper the working of the economy and simplification and rationalisation are urgently required. The ideal solution, in the Chamber's view, would be a unified taxation system with all taxes levied by the Centre and with the resultant revenues allocated to the State on an agreed basis. It is appreciated that in a country with a federal constitution such an ideal may be incapable of realisation; but it should at least be borne in mind as the ideal towards which practice should endeavour to approximate.

Question 27.—*How far in your view could the tax system be used to secure any order of priorities in the development programme in the private sector?*

The Chamber does not consider that any general tax system can be effectively used for securing the order of priorities in the development programme of the private sector, but it would invite attention to the proposal for the establishment of development funds made in answer to Question 21 which does furnish a means for stimulating saving and capital formation for approval purposes.

Question 28.—*What are the possibilities and limitations of tax policy as an instrument for economic development?*

- by influencing over-all demand,
- by reducing consumption and unessential investment,
- by positive inducements for desirable investment,
- by redistribution of incomes,
- in other ways?

The Chamber has already stated that, after fulfilling the basic object of raising the State's revenue requirements with the least damage to the economy, the main ancillary function which a taxation system can perform is to promote savings and investment and to encourage enterprise, particularly as envisaged in the suggestion for development funds made in reply to Question 21. Apart from achieving this secondary objective, the Chamber does not consider that taxation should be used for any of the other purposes specified in this question as their efficacy as an instrument for economic development in India is open to grave doubt.

Question 29.—How would you assess the scope and efficacy of tax policy as compared to monetary policy and direct controls as an instrument of planned economic development in India?

The Chamber has no views to offer.

Question 30.—Do you think that the present tax system in India makes for a reduction in inequalities of income and wealth?

Question 31.—What modifications in the tax system would you suggest for securing a larger degree of economic equality, consistently with maintaining the incentives to capital formation and higher production?

The Chamber has noted with some concern that while the second of the Commission's terms of reference is the suitability of the present system of taxation with reference to, first, the development programme of the country and the resources required for it and, secondly, the objective of reducing inequalities of income and wealth, the latter has been placed first in the Questionnaire itself as an objective of a sound tax policy, and there is evidence in later questions, particularly Question 31, that the Commission attach great importance to this particular objective. The manner in which Question 31 has been framed seems to infer acceptance of the belief that adequate incentives to capital formation and higher production already exist and that, whilst maintaining them at their present level, there may still be scope for further progress towards economic equality. The Chamber is in complete disagreement with this general approach and, in particular, with the view that the existing rates still leave sufficient incentive to encourage savings, investment and expanded production. As explained in answers to other questions, it is the considered view of the Chamber that the present levels of taxation involve the serious diminution of the level of incomes in the higher income brackets without any corresponding increase in the social services which might have improved the lot of the poorer sections of the population. In other words, such re-distribution of wealth as has taken place has been of no assistance whatsoever in dealing with the problem of mass poverty. On the other hand, it has seriously prejudiced not only the incentive but the ability to contribute to savings and capital formation and provides no stimulus whatsoever to higher production or efficiency. Any alterations in the tax system to secure a greater degree of economic equality would merely worsen an already unsatisfactory situation.

Question 32.—What place would you assign to public expenditure as compared with the tax system in achieving a greater measure of equality of income?

It is presumed that by income in this question the Commission means real income as expressed in terms of the standard of living and not merely to monetary income. Subject to this, the Chamber's view is that the objects referred to are achieved more satisfactorily by public expenditure devoted to social services than by taxation.

Question 33.—Have you any changes to recommend in tax policy in relation to the investment of foreign capital in India?

Yes, the following—

- The removal of the existing discriminatory super-tax provisions of Clauses (ii) and (iii) of paragraph D of Part II of the First Schedule of the current Finance Act;
- Revision of the definition of "Residence" under section 4A of the Income-Tax Act on the lines indicated in the Chamber's answer to Question 46;
- The negotiation of satisfactory tax treaties with the countries predominantly engaged in foreign trade with India;
- The changes either in the provisions or in the interpretation of sections 42 and 43 of the Income Tax Act indicated in the Chamber's reply to Question 51.

Question 34.—Article 269 of the Constitution enumerates the following taxes which may be levied and collected by the Union but the proceeds of which are to be assigned to the States:

- duties in respect of succession to property other than agricultural land;
- estate duty in respect of property other than agricultural land;
- terminal taxes on goods or passengers carried by railway, sea or air;
- taxes or railway fares and freights;
- taxes other than stamp duties on transactions in stock exchanges and futures markets;
- taxes on the sale or purchase of newspapers and on advertisements published therein.

How do you assess the possibilities of adding to the Country's tax resources in respect of the above items?

In the opinion of the Chamber it may be possible to increase the revenue accruing from succession duties and estate duties in respect of property; the other tax sources mentioned in this question, however, should not be required to make an increased contribution, or any contribution where one is not already levied.

Question 35.—Other possible ways of adding to tax receipts which have been suggested are taxes on capital, reintroduction of the salt duty, surcharges on land revenue, betterment levies, agricultural income-tax, social security taxes and modification of the policy of prohibition having regard to the directive principles of the Constitution. What are your views regarding the desirability and the probable scope of each of these forms of taxation?

The Chamber considers that, in line with its recommendation for an increase in indirect taxation, there is a very strong case for the re-introduction of the Salt Tax in the form of an extension of Sales Tax to that commodity. There is in the Chamber's view an equally strong case for a modification of the policy of prohibition. The large tax revenue surrendered by the States which have introduced prohibition together with the increased expenditure on prevention are more than State budgets can afford, particularly since it appears to be doubtful whether prohibition policy has prevented the abuse of alcohol or indeed its general consumption. It is unlikely that this situation will improve and, as experience in many other countries shows, there may be increasing resort to evasion with the consequent dangers of corruption of the public services and the development of a general contempt for law and order. In these circumstances the Chamber thinks that the policy of prohibition requires drastic modification and indeed that the time for this is already overdue. As regards the reference to taxes on capital or a capital levy the Chamber cannot emphasise too strongly that such a tax would be fatal to the country's future economic development.

Question 36.—Do you consider it desirable and feasible to levy a tax on unearned increments in value of land and other property as a result of public projects of development?

Although the theoretical attractiveness of taxation of unearned increments of land and property value has made it the subject of endless fiscal schemes during the past century in many countries, experience—particularly recent experience in the United Kingdom—has shown, it is thought conclusively, that its application is subject to the most extreme practical and administrative difficulties. It is considered that such a tax in the form in which it has been applied in other countries is impracticable and that the nearest approach which can be made to the taxation of unearned increments is the periodical reassessment of land revenues in the agricultural areas.

Question 37.—What measures would you suggest for increasing the receipts from existing sources of revenue?

In this connection the Chamber thinks that a vital aspect of any attempt to diminish tax evasion is to stir up public opinion against it and in support of the honest taxpayer who meets his obligations. It is suggested, for consideration, that Government might be prepared to publish lists of those who have fulfilled their obligations in this respect; this is already done, it is understood, in Sweden and the United States. A possible alternative is to give active support to the formation of an organisation of taxpayers which would give suitable publicity and honourable mention to those who have paid their taxes and which, in particular, would encourage the spirit of emulation in the declaration of the highest published incomes and income-tax payments.

Question 38.—What other new sources of taxation can you recommend?

Apart from the Chamber's main proposal for an increase in indirect taxation, particularly by an extension of sales tax, the only other new source of taxation which it desires to recommend is a State lottery. The particular advantages of State lotteries are their ease of collection and their psychological effect in introducing an element of hope into the daily grind where poverty is all too common. The Chamber would suggest that the Commission should give its most careful consideration to this proposal; and since such objections as there are likely to be to a State lottery will probably be based on ethical considerations, the Chamber would further suggest that the proceeds of the lottery might be allotted for some specifically desirable object such as education or an extension in hospital and medical facilities. In addition, the Chamber would point out that this method of raising revenue has been adopted in many countries.

Question 39.—To what extent and as regards what taxes should the powers of the Centre to impose surcharges under Article 71 of the Constitution be used?

The Chamber has no views to offer on this question.

Taxation and Inflationary and Deflationary Situation.
Question 40.—What are the scope and limitations of tax policy as an instrument for dealing with inflationary or deflationary situations in Indian conditions?

Question 41.—*In countering inflationary or deflationary conditions in the economy, what part would you assign to changes in the following :*

- (a) direct taxes,
- (b) indirect taxes,
 - (i) import duties,
 - (ii) export duties,
 - (iii) excise duties,
 - (iv) sales tax?

Question 42.—*To what extent is it possible to increase the inherent capacity of the tax system to counter-act inflationary or deflationary conditions in the economy?*

Question 43.—*What are your views in regard to the relative importance of public expenditure policies in moderating the forces of inflation and deflation in Indian conditions?*

Question 44.—*Apart from using tax policy to counter inflation or deflation in the economy as a whole, would you suggest tax changes for dealing with the effects of rising or falling prices on particular groups of taxpayers or sectors of the economy?*

Question 45.—*How do you assess the present situation in regard to the strength of inflationary or deflationary influences, and what adjustments, if any, in taxation are indicated in the light of your views?*

Answer to questions 40 to 45—

Taxation policy has a useful, but not decisive, role to play in meeting inflationary and deflationary situations. Under Indian conditions, however, there are so many practical difficulties in the application of modern British and American theories on this subject, and so many uncertainties as to their effects, that the Chamber regards this section of the questionnaire as of academic, and secondary, importance. Accordingly it is confining itself to a single comprehensive statement.

To take deflationary situations first. The correct tax policy at such times is to lighten the tax burden, particularly personal and company taxation. Rates of taxation under these latter heads are now so high in India that if an acute deflation were encountered in the next few years as a consequence of a world trade slump, there would be ample scope for sharp and beneficial reductions as part of a "contra-cyclical" tax policy.

Turning to the more familiar danger of inflation, the Chamber contends that the Government has quite sacrificed the flexibility of this weapon by perpetuating as normal the very high rates of taxation introduced as an anti-inflationary measure during the war. The great increases in personal and corporate taxation in the years 1940-47 made a contribution (though a limited one) to the control of inflation; but their retention as part of the tax structure has meant surrender of the usefulness of tax policy as an antidote to inflation. Not only would further increases in personal and corporate taxation be a source of positive inflationary forces, but current rates tend to perpetuate inflation by discouraging extra productive effort. Taxation that aims at draining off surplus money is apt to defeat its own objects, for by diminishing the reward for hard work and special exertion it causes a decline in productivity. The result is that, in a situation where there is too much money chasing too few goods, this supposedly disinflationary taxation reduces the goods as well as the money and thus fails to achieve its object. This is aggravated by the encouragement which high rates of taxation give to company managements to indulge in irresponsible expenditure and to the private citizen to divest himself of taxable income. Therefore the first requirement of any policy that aims at using personal and corporate taxation as an anti-inflationary measure is that rates of taxation be brought down from the ceiling. Similarly, to realise the utility of brakes on a motor-car it is necessary that they should not be applied all the time.

Even when these adjustments had been made, there would still be features of the Indian tax system that make it less effective for the purpose of controlling inflation. The chief of these features has been referred to above—the incidence of taxation on a small section of the population, which leaves the bulk of inflationary purchasing power outside the scope of disinflationary tax policies. Under the tax system that has hitherto been in force, the greater part of the population has been practically exempt from taxation. It is their needs however, and particularly their need of the elementary necessities like food, clothing and housing, which give rise to the main economic stresses; taxation does not touch these needs at present and is therefore largely ineffective during an inflationary crisis. The revision of the tax system that the Chamber suggests, by extending the scope of taxation over larger sections of the population, would considerably increase the effectiveness of tax policy both in inflationary and deflationary situations. Such price rises as would be caused by an increase in indirect taxation would not be inflationary because they would be "once-for-all" rises, unlike the cumulative price rises that occur in an inflationary spiral. The increment in price caused by higher indirect

taxation would be drained off by Government, and since it could not then be reflected in a rise in business profits would not be able to cause further rises in other prices. The snowballing effect of rising prices, rising profits and more price rises, which is precisely the feature of a genuine inflation, would be avoided in the case of price rises brought about by disinflationary taxation on articles of common consumption. Conversely, the revision of the tax system suggested by the Chamber would enhance the value of tax policy as a weapon against deflation. Reductions in indirect taxation would stimulate purchasing by bringing about lower prices without the appearance of business losses which provide the cumulative factor in a slump.

Finally the Chamber would warn against the too facile application of disinflationary taxation theories framed in other countries to the vastly dissimilar conditions of India. In the countries where these theories originated, taxes bear on most incomes; in India they bear on only a small minority of incomes. When pressed too far, therefore, the inflationary consequences of high taxation appear more quickly in this country than in countries like Britain which realise only slowly (but none-the-less surely) the limitations of "contra-cyclical" taxation.

PART II—"DIRECT TAXES"

RESIDENCE.

Question 46.—*Do the provisions of the Income-tax Act (Sections 4A and 4B) regarding the determination of residence of various assesses, viz., individual, Hindu undivided family, firm, association of persons and company, require any modification? In particular, what is your view regarding the retention of the category described as "not ordinarily resident"?*

Yes; the present basis of determining "residence" on the part of a company by reference to income is fallacious and acts as a deterrent to the flow of capital into the country which it is the policy of the Government of India to encourage within limits and subject to reasonable conditions. There is no justification, in the Chamber's opinion, for assessing income that arises outside India. This important and deterrent provision of the law is due to the present artificial definition of "residence" under Section 4A(c) which, in contradistinction to the treatment for instance of a Hindu undivided family, applies two criteria, namely (a) if the control and management of the affairs of the company are situated wholly in the taxable territories of India or (b) if the income of the company arising in the taxable territories exceeds the income arising without the taxable territories. Criterion (b) should, in the Chamber's view, be deleted not only because of the effects of it referred to above, but because its artificial nature has an adverse influence on the negotiation by India of satisfactory tax treaties or Double Income Tax Avoidance Agreements which would in themselves remove many of the present impediments created by the artificial definition of "residence".

The category "not ordinarily resident" should certainly be retained. It equitably caters for numerous cases in which expert technical and other advisers can visit India for relatively short visits; without this category of "not ordinarily resident" India might well be deprived of the temporary services of such technicians and consultants to her own disadvantage and to the detriment of the Five Year Plan.

A related question arises in connection with Section 4A calling for an amendment of the latter section. For the purpose of that section the "income arising in taxable territories" is one of the alternative criteria for the determination of "residence" and there is nothing positive to show that agricultural income is not included in income for that purpose. In the Chamber's view this should be remedied by the addition of an explanation or proviso to Section 4A making it clear that "income" for the purposes of that section is income taxable under the Indian Income-Tax Act.

INCOME.

Question 47.—*Does the definition of "income" [Section 2(6C)] require any modification?*

The reference to "capital gains" could now suitably be deleted from Section 2(6C).

Question 48.—*Are there any receipts or gains which are not taxed at present but which, in your opinion, should be taxed and vice versa? In particular, what is your view regarding the taxing of capital gains?*

In the Chamber's memorandum to the Commission, dated the 30th May, 1953, reference was made to the tendency of certain Income-Tax Officers, whether of their own volition or under directions from the Central Board of Revenue, to disallow (in disregard of the assessee's contentions) what the latter claims to be perfectly legitimate expenses incurred for the purposes of the business; and secondly, to compel the assessee to resort to appeal, thus involving the latter in legal

expenses which are in turn disallowed—as also, quite unjustifiably, are items such as costs of renewals of leases and patent and copyright expenses. There is also a tendency on the part of Income-Tax Officers, outside their own functions as revenue officials, to query the powers of a company in such matters as the quantum of directors' remuneration where the profits are small; of bonus or other payments to employees either awarded by Tribunals or which appear to the I. T. Os. to be high in relation to a low basic salary scale or are due to the recognition of personal initiative; and of other items of business expense which the I. T. O. personally considers to be out of proportion to the size of the business. Where there is clear evidence of *bona fide* expenditure other than capital expenditure having been incurred for the purposes of the business, such expenditure should be allowed without question.

Under an Act designed to tax income, capital gains should not be taxed. And if they are taxed under any separate enactment—for which there would seem to be no justification with the pending introduction of estate duties—provision should clearly be made for the allowance of capital losses.

Question 49.—*Have you any comments on the present position regarding taxation of profits, which accrue or arise abroad, on their repatriation to India?*

The Chamber considers that, where the tax payer is prevented from transferring the income to India either by the laws of the overseas territory or any executive action of its Government or by the impossibility of obtaining foreign currency in the territory, the assessment of tax on income arising abroad should be deferred. In addition, where exchange control regulations are responsible for delay in the repatriation of such profits beyond the dates specified in Section 4, the Income-Tax Officer should be specifically required to deem such profits eligible for the advantages they are intended to enjoy.

Question 50.—*What change, if any, is called for in the definition of "dividend" [section 2(6A)], e.g., in relation to "bonus shares"?*

Clause (d) of sub-section (6A) of Section 2 includes within the definition of "dividend" "any distribution made to the shareholders of a company out of accumulated profits on the liquidation of the company" subject to the proviso that only the accumulated profits so distributed which arose during the six years preceding the liquidation shall be so included. The Chamber considers that this provision of the Act should be so worded as to make it clear that the shareholder on liquidation shall be taxable only to the extent to which the distribution exceeds the capital value of the shares, i.e., the nominal value whether received for cash or for value and that only to that extent bonus shares issued within the six-year period shall be taxable.

Question 51.—*Do the provisions of the Income-tax Act relating to the taxability of non-residents through their business connections in India in respect of income deemed to accrue or arise within the taxable territories (section 42 and 43 of the Income-tax Act) affect adversely the interests of persons engaged in foreign trade? If so, what modification would you suggest in these sections?*

Yes, the interpretation now being placed on these sections very materially affects the interests of persons trading with but not in India and is becoming a strong impediment to the development of that trade in the absence of tax treaty arrangements or D. I. T. Avoidance Agreements with other countries, particularly the U. K. For instance, Income-Tax Officers here are seeking to raise assessments on concerns in India as Agents for non-residents where the concerns in question are buying goods in India on behalf of non-residents. Again, non-residents manufacturing goods outside India, selling them outside India to residents in India and then shipping the goods to India and forwarding documents to a Bank in India for the Bank to collect the sale proceeds on behalf of the non-residents and deliver the documents to the buyer when payment has been received are faced with the contention that this constitutes receipt of the proceeds which includes the profit in India by or on behalf of the non-residents and that therefore the whole profit is assessable in India.

There is a considerable amount of case law on this question to which the Chamber would invite the Commission's attention, such as Civil Appeal No. 41 of 1952, *Messrs. Turner Morrison & Co., Ltd. vs. Commissioner of Income-Tax, West Bengal*. These cases, and the earlier ones referred to therein, exemplify the range of commodities forming an important part of India's international trade which stands to be affected most adversely by the current interpretation of Sections 42 and 43—Tea, Wool, Salt, Shellac, to mention a few. With regard to the mere purchase of goods in India and other acts which have been held to constitute operations carried out in India for profit by or on behalf of a non-resident, a charge of tax under Section 42 is a most serious deterrent to trading with India. Other countries do not admit the validity of India's claim to tax and refuse double

tax relief for Indian tax suffered. At the present time this means that any profit attributed to the act of purchase suffers an overall tax burden of more than 100 per cent. where the non-resident buyer is resident, for example, in the United Kingdom, United States, Germany or Japan. There can be no arguing that a consequence of this kind will affect trade with India to an increasing extent as Section 42 is more and more diligently applied and it should not be forgotten that in recent years India has relied upon buyers in these territories to take more than 50 per cent. of her exports. The result of allowing this position to continue will inevitably be a grave restriction of trade to India's detriment in a buyers' market; overseas sellers will either refrain from trading with India or will do so only where the title in the goods and payment can be obtained outside India. It is very essential therefore that prompt steps should be taken (a) to amend the law to exempt, in the case of the non-resident who buys or sells goods in India, the manufacturing and other profits attributable to operations carried on outside India by the non-resident and (b) to exempt profits when the non-resident has not an established place of business in India.

Several of the difficulties referred to above arise because of the absence of any statutory definition of "business connection" thus permitting a variety of interpretations by individual Income-Tax Officers. This omission should be remedied, it is suggested, in such a way as to ensure that non-residents may be more precisely aware of their liabilities under the Act. Based on current international practice as agreed to by most countries in recent double income-tax agreements—the negotiation of which, particularly with the United Kingdom as India's largest customer, is very essential—an explanation should be added to Section 42 providing firstly that a non-resident person shall not be deemed to have a business connection in the taxable territories unless he maintains therein a branch, management, factory or other fixed place of business; secondly, that an agent in the taxable territories for a non-resident person shall not be deemed to be a business connection unless he has and habitually exercises a general authority to negotiate and conclude contracts on behalf of the non-resident or keeps a stock of merchandise from which he regularly fills orders on his behalf; thirdly, that a non-resident person shall not be deemed to have a business connection in the taxable territories merely because he conducts business dealings through a *bona fide* broker or general commission agent acting in the ordinary course of his business as such; and, fourthly, that a fixed place of business or an agency maintained by a non-resident person solely for the purchase of goods within, and the sale or conversion of these goods without, the taxable territories shall not be deemed to be a business connection.

Question 52.—*What modification would you suggest in the definition of "agricultural income" [section 2(1)] to avoid the contingency of the same income being taxed by the Central Government as well as the State Governments, e.g., in respect of income from forests, dividends from agricultural companies, etc.?*

As was pointed out in the Chamber's memorandum to the Commission, dated the 30th May 1953, this involves the constitutional question, which is recognised to be a difficult one, of the respective rights of the States and the Central Government. The Chamber then urged, and still urges, that whatever these difficulties, the essential from the assessee's point of view is that there should be a co-ordinating authority which will determine the assessee's taxable income from whatever source, that the agricultural income should then be arrived at and that the agricultural portion so determined should then be taxed either by the Centre on behalf of the States or by the latter on a uniform basis. The definition should be amended to make it clear that any dividend or part thereof paid out of agricultural income should also be treated as agricultural income. The definition of "agricultural income" should be amended in such manner that the agricultural income arising in a foreign country is treated as "agricultural income". This will avoid the same income being taxed under Agricultural Income-Tax in the foreign country and under Indian Income-Tax in India.

Question 53.—*Are you in favour of integrating agricultural income with non-agricultural income for rate purposes? If so which of the following methods would you advocate:*

- (i) Aggregation of agricultural and non-agricultural incomes only under the State Acts;
- (ii) Aggregation of agricultural and non-agricultural incomes only under the Central Act;
- (iii) Aggregation of agricultural and non-agricultural incomes both under the State and the Central Acts?

Please discuss the administrative, constitutional and other problems that are likely to arise if any of the above alternatives is adopted.

No; the Chamber is not in favour of integrating agricultural income with non-agricultural income for rate purposes.

Question 54.—Would you recommend the abolition, by a suitable amendment of the Constitution, of the distinction between agricultural and non-agricultural incomes and the taxation of both types of income, aggregately under a Central Act?

No. As has already been suggested in the Chamber's answer to Question 52, the essential is that the assessee's taxable income from whatever source and the agricultural portion thereof should be determined by a single authority and the State Agricultural Income-Tax Acts made uniform in this respect.

Question 55.—Is the treatment given to irregular and fluctuating income in the present law satisfactory? In particular, should any changes be introduced—

- (i) to average income over a number of years where receipts are irregular and fluctuating;
- (ii) to spread lump sum receipts over a number of years?

The existing provisions of Section 12AA, introduced by the Finance Act, 1953, represents an improvement on the previous position.

EXEMPTIONS.

Question 56.—Do you think the present provisions regarding exemption of charitable and religious trusts need any modification? If so, in what respects?

On the assumption that this question relates only to the taxation of the income of charitable and religious trusts, as distinct from the allowance of donations to such bodies, the Chamber has no suggestions to make at present. So far as donations to charitable and religious trusts are concerned, further time is required to observe the practical effects of the recent amendments made to Section 4(3)(i).

Question 57.—(i) Should the business profits of co-operative enterprises, which are now exempt, be charged to income-tax and super-tax? If so, should co-operative societies be treated as companies or should a lighter levy be imposed? In case the exemption is continued, should it be restricted to certain categories of co-operative enterprises.

(ii) Do you agree with the view that the income derived by co-operative housing societies by way of rent should not be treated as income from property assessable to income-tax? Would you, in this respect, differentiate between tenant co-partnership housing societies and other types of housing societies?

(iii) It has been suggested that there are divergent decisions by different Income-tax authorities in respect of assessment of income of co-operative societies from sources other than business. If this is so, please indicate such decisions and the measures you would suggest to secure uniformity in assessment.

In the view of the Chamber the position of co-operative societies, Chambers of Commerce, clubs and the like should remain as at present to the extent to which their activities are mutual.

Question 58.—Are you in favour of continuing the concessions given to new industrial undertakings under section 15C of the Income-tax Act? Have initial and extra depreciation allowances made the concessions practically infructuous? If so, what are the directions in which the provisions of this section should be modified?

Section 15C was introduced with the intention of granting relief to newly established industrial undertakings but has not in practice been of much benefit to them, principally owing to the initial and double depreciation allowances which merely have the effect of a postponement of tax and do not reduce the ultimate liability.

It seems to the Chamber therefore that consideration should be given to some means whereby more substantial benefit will accrue under Section 15C. One such method, which the Chamber recommends, is that a newly established company should have the option of taking an allowance under Section 15C in preference to the initial and/or double depreciation allowances; the 15C allowances would then be an exemption from liability to tax on a portion of the income of the company and not merely a postponement of the payment, while the depreciation allowances would be obtainable at some future date.

Question 59.—A suggestion has been made that banking profits of foreign branches of Indian banks should be given concessional treatment for tax purposes in order to encourage the opening of branches abroad. What are your views?

The Chamber sees no sound grounds for such an arrangement.

Question 60.—Should any liberalisation be made in the present limits of exemption from tax of life insurance premia and contributions to provident funds?

Yes—certainly. It is, in the Chamber's view, quite unrealistic that the 1939 limits should continue under

present day conditions (a) when the costs of living are so much higher with no prospect of their returning to pre-war levels in the foreseeable future as Government themselves admit, (b) when the policy of Government and private employers alike is to provide more for saving by introducing and liberalising provident funds for their employees, whether in accordance with legislation, tribunal awards or by invitation. In recognised Provident Funds both employers' and employees' contributions should be deducted from total earned income to arrive at the taxable earned income both for income-tax and for super-tax purposes. In addition, the present limit of Rs. 6,000 in respect of exemption from tax on life insurance premia and provident fund contributions should be raised to Rs. 12,000 or one-sixth of income whichever is the lower.

ALLOWANCES.

Question 61.—(i) Do you favour the grant of larger depreciation allowances to assist industry to finance the considerably increased costs of replacement of assets? If so, how and in what form should they be given—

- (a) by larger depreciation allowances on new assets;
- (b) by revalorisation of existing assets;
- (c) by treating the excess of replacement cost over original cost as revenue expenditure;
- (d) by any other method?

(ii) What is the justification for assistance from public resources to certain classes of tax-payers only by way of covering partially the excess of replacement cost over original cost of old assets?

(iii) In case adequate justification exists for assistance by Government in the form of tax concessions to meet the situation, what safeguards should be prescribed to see that the funds so made available are utilised for the purposes for which they are intended?

(i) Under present conditions of rising prices and high taxation it is difficult, if not impossible, for established companies to set aside out of taxed profits sums sufficient to replace their buildings and plant. This is a matter of particular concern in view of the continuing rise in prices which has not only persisted for several years but shows no sign of abating.

Initial depreciation allowances are at best a compromise since they merely represent a postponement of liability to tax, but in so far as they have been of limited assistance to companies which have been able to replace plant and machinery they should be retained in the taxation structure.

The crux of the problem is not so much to devise a new method of computing depreciation on new assets, since these will be brought in at cost which will equate with replacement value, but to evolve a means of granting larger allowances on existing assets so that funds may be accumulated for their eventual replacement. It is suggested that, in spite of the administrative difficulties involved which will inevitably arise from any departure from the present system of granting depreciation allowances, this may best be achieved by the revalorisation of existing assets for income-tax purposes, taking 1939 as the base year.

An alternative, simpler and perhaps preferable method would be to allow an assessee to charge in addition to his aggregate normal, double and initial depreciation a further sum on the understanding that (a) this further sum is placed to a special Reserve, (b) the Reserve will be applied only for the purchase of new block items, (c) the original cost of any new block items will be reduced by the tax on so much of the Reserve as is utilised for their purchase, and (d) any part of the Reserve not utilised will be added back for tax purposes.

A connected question arises. In the event of loss of buildings or plant, insurance payments are treated as a taxable profit under Section 10(2)(vii) to the extent to which if the asset is insured for its replacement value, such insurance payments do not exceed the difference between the written down value and the original cost. In the Chamber's opinion Section 10(2)(vii) should not be applied in such circumstances provided the asset is in fact replaced and subject to the proviso that the tax foregone will be deducted from the original cost of the replacement for tax purposes.

(ii) The justification surely is that unless some such step is taken, industries in this country will not be able to modernise and expand as they cannot at present find the difference between the replacement cost and the original cost out of taxed income; and in existing competitive world markets, India's products will quickly be outpriced with a consequent contraction of business and assessable profits to the detriment of the country's revenues.

(iii) It will be necessary to provide that the depreciation allowed in the form of such concessions must be funded and utilised for the purpose for which it is put to reserve within a reasonable period.

Question 62.—*Are any changes called for in the classification of assets for purposes of depreciation, rates of depreciation and methods of computing the allowances?*

The Chamber considers that the existing classification of assets and the rates applicable to them are reasonable. A change, however, is very necessary in the method of computing the allowances. The amount of time and money spent by assesseees and their advisers in computing depreciation based on the month when the building is completed or the machinery is installed is colossal. These involved calculations serve no real purpose and little revenue would be lost by reverting to the previous practice of calculating depreciation on the additions for any particular year on the basis of the whole year.

Allowances should also be granted for such items as development expenses, exploration for oil, if not dealt with by way of depletion allowances, and for patent and copyright expenses and other items of a similar nature.

Question 63.—*Should any tax concessions be given to encourage development of mineral resources? If so, what form should they take? In particular, should depletion allowance on wasting assets be allowed? How should it be computed for different kind of assets you have in view?*

In the opinion of the Chamber it is most important that tax concessions should be given to encourage the development of the mineral resources of the country. The special justification for this is the extent to which the exploitation of minerals involves not only operations of a costly and uncertain nature but also involves wasting assets. In other countries income tax laws make due recognition for these special characteristics. For instance, in Canada a percentage depletion allowance of 33½ per cent. of nett profits may be claimed by mines producing base metals and industrial minerals from "non-bedded deposits". In the United States metal mines are allowed 15 per cent. depletion allowance on gross income limited to 50 per cent. of the nett income after charging depreciation, rent and royalties but before charging depletion itself. It is essential, in the Chamber's opinion, that percentage cost depletion allowances as well as provision for the treatment as revenue of certain expenditure which has been considered capital expenditure in the past, should be introduced for companies working wasting assets. It should be made possible in such cases for the company to obtain more than 100 per cent. of the original cost.

Question 64.—*In what form would you provide for personal and family allowances—*

- (i) *exempting the first slice of income from tax; or*
- (ii) *providing specific allowances for family and dependents?*

In the case of (i), do you consider that the first slice—Rs. 1-1,500—should be revised? In the case of (ii), what treatment would you give to the Hindu undivided family?

The view of the Chamber is that personal and family allowances could not work satisfactorily under existing conditions in India.

Question 65.—*Should the present law regarding admissible expenses [section 10(2) be altered]? If so, please indicate, with reasons, the items of expenses (i) which are not now admissible but, in your view, should be admissible and (ii) which are now admissible but, in your view, should not be admissible.*

Yes; and, as already pointed out in answer to Question 48, Income-Tax Officers should be directed to adopt a more reasonable and less grudging attitude towards expenses as a whole incurred for the purposes of the business.

The following are among the items now either inadmissible which ought to be admissible or which are frequently allowed only in part or after appeal:

- (a) Bonuses or other payments made by the employer to employees.
- (b) Legal expenses including those of appeal under the Act and otherwise should be allowed but not those on the acquisition of capital assets.
- (c) Costs of renewal of leases.
- (d) Patent and copyright expenses.
- (e) Directors' remuneration as agreed by the company irrespective of the profits of the company.
- (f) Other *bona fide* items of expenditure referred to in answer to Question 48.

All these are legitimate expenses incurred for the purposes of the business and should not be called in question.

The Chamber is not aware of any allowances now admissible which should not be admissible in the future. On the other hand the Chamber is strongly of the

opinion that, from the point of view of the country as a whole, it is desirable that the disallowance of interest on borrowed capital which is payable outside the taxable territories should be abandoned.

RATE STRUCTURE.

Question 66.—*(a) Are you in favour of combining income-tax and super-tax into a consolidated levy?*

- (b) *What are the merits or demerits of such a step from the point of view of (i) assesseees, (ii) administration?*
- (c) *Are you satisfied with the degree of progression in the present rate structure (both income-tax and super-tax) especially in regard to its economic effects?*
- (d) *In case you consider a change is necessary, what alternative rate structure would you recommend?*
- (e) *Should the rate of surcharge levied under Article 271 of the Constitution also be graduated?*

(a) Yes, but for companies only. While any adjustment of rates would present points of difficulty, the grossing and credit for tax on dividends from limited companies in the case of individuals might be limited to a proportion of the consolidated rate of tax applicable to companies.

(b) The principal merit from the point of view of assesseees who are companies is that it would more readily enable them to ascertain their liabilities, but on balance it would make little difference. From the administrative angle, a consolidated levy is simpler. Conversely, consolidation would necessitate some change in the amount or percentage of the Centre's income-tax receipts allocated to the States.

(c) No. In the Chamber's Memorandum of the 30th May strong emphasis was laid on the fundamental need for a revised tax system which would offer greater incentive to the individual to work harder in order to save and invest and attention was invited to the potentialities of three main categories of individuals whose position in this respect called for consideration, viz. (i) the large group of persons mainly of the employed and salaried classes who, under a more encouraging tax structure, would habitually set aside money for saving and investment, (ii) self-employed persons, particularly among the professional classes and (iii) technicians.

By reason of the unduly steep progression of the super-tax rates, especially in the lower and middle slabs, saving for investment on the part of these classes particularly is well-nigh impossible under present-day costs of living. Initiative and hard work are therefore at a discount and capital formation, whether in the private or the public sector, is correspondingly difficult and prejudiced.

(d) The super-tax progression should be much more gradual in the slabs indicated above. The steps in the present structure are too high and might be replaced by a suitable percentage structure which would give a greater range of variation and scope for a more gradual progression.

(e) No, for the reason that any increase in the rate of surcharge for any category of assessee might mean a total tax in their case out of ratio with others. In particular, an increasing percentage might mean a total rate in the case of those with the larger incomes of such an amount that there would be a loss of incentive and a lack of funds for saving and investment.

Question 67.—*Have you any change to suggest in the exemption limit for individuals (Rs. 4,200) and for Hindu undivided families (Rs. 8,400)?*

The greater need, from the point of view of the country's economic progress and industrial development, is not so much for an increase in the exemption limit as for the grant of increased allowances such as those on earned income and provident fund/life assurances which will lead to increased saving, investment and capital formation.

DIFFERENTIATION.

Question 68.—*(a) Are you in favour of a distinction being made between earned and unearned incomes? What is the economic justification for such a distinction?*

(b) *Is the present definition "earned income" in section 2(6AA) of the Income-Tax Act adequate in this respect or would you suggest any modification?*

(c) *Should the quantum of relief now afforded be extended or reduced? If so, to what extent?*

(a) Yes, this distinction should be continued and if possible made more attractive to wage and salary earners, including pensioners. It is one of the main stimulants to productive effort of which the country stands in great need if the current Five Year Plan and its successors are to be successful.

(b) In the Chamber's view the present definition is satisfactory.

(c) Yes. It would go a long way towards achieving the purpose referred to above were the quantum of relief increased from Rs. 4,000 to at least Rs. 6,000 or one-fifth of income whichever is the lower.

MISCELLANEOUS.

Question 69.—Have you any changes to suggest regarding the principles followed in valuing stocks of a business for assessment purposes?

Yes. The methods adopted by individual income-tax officers have not been consistent in the past, for instance in the acceptance of market rates. In the Chamber's view, the basis should in future be either cost or market rate whichever is the lower in the case of manufactured goods. But in the case of seasonal crops, such as Tea, which are ordinarily sold between the close of the financial year and the preparation of the accounts, the existing system of allowing these "stocks" to be valued at the actual prices realised should of course be continued.

Further, in the case of raw materials there is no need to write down to the replacement cost if the raw materials in question can be manufactured into the finished article at their existing price and still be sold at a profit. But the valuation should also be at cost or market price whichever is the lower, the market price in this case being the sum at which the finished product can be sold less the cost of manufacture.

Question 70.—Do you consider that any change is called for in the method of assessment of the Hindu undivided family? If so, in what respects?

The Chamber is not competent to express an opinion.

Question 71.—Should exemption from income-tax be allowed in respect of voluntary surrender by managing agents of the whole or a part of managing agency commission? What safeguards should be laid down against misuse of such a provision?

Yes, in all fairness, where commission is foregone in the interests of the managed company. The practice of attempting to tax foregone managing agency commission is a very recent development and the inequity of it, in bona fide cases even where the commission has been drawn and subsequently refunded when the results of the managed company are ascertained, has been represented in detail to the Central Board of Revenue.

It is of course necessary for the I. T. O. to satisfy himself that the foregoing or refunding of the commission is irrevocable and not a deferment—as can readily be done in individual cases and surely requires no check in the case of managed public companies.

Question 72.—On what basis would you suggest that double income-tax avoidance agreements should be concluded between India and other countries?

On the model of what is now widely accepted as the standard form of international tax treaties or D. I. T. Avoidance Agreements such as those between the United Kingdom and the United States, between the United Kingdom and Canada and between the United Kingdom and Burma; that is to say, on the principles (i) that each country taxes only such portion of the income as originates in that country through a regular establishment, (ii) that the profits of shipping and aviation companies are exempt and (iii) that the same income is never doubly taxed.

Unilateral relief is now obtainable in the United Kingdom up to a maximum of 100 per cent. of the United Kingdom rate on profits outside the United Kingdom and on this particular income so long as the rate in India is lower than the rate in the United Kingdom, the individual tax payer does not suffer. The rate in respect of branches of United Kingdom companies has, however, been increased by 6 pies to 8-45 annas in the rupee under the recent Budget; and in view of the recent reduction of taxation in the United Kingdom and the possibility of further reductions in future, care, it is suggested, should be taken to ensure that the rate in India is not higher than that in the United Kingdom.

While on certain income, so long as the Indian rate of tax is below that in the United Kingdom full recovery will be made under the unilateral relief provisions in the United Kingdom law, it should be borne in mind that unilateral relief is limited to income accruing or arising outside the United Kingdom while relief in India is limited under Section 49D to income accruing outside India. There is, however, no relief in either country in respect of income accruing or arising in the United Kingdom but deemed by India to arise or accrue in India. This is a matter which should receive the Commissions consideration.

Question 73.—Is the present law relating to determination of "bona fide annual value" of property and deductions allowed from it satisfactory? If not, please give any alternative proposals you have in this respect.

The law relating to the determination of "bona fide annual value" is not unsatisfactory, except that the owner's share of Municipal Taxes should be deducted, but the deductions allowed from it are totally inadequate. The allowance for repairs should be the actual or the average of the past five years and the deductions permissible for collection charges and the like should be the actuals as for the computation of profits for the purposes of the business.

Alternatively, where the property is let out, the whole of the income from property should be calculated on the actuals with an allowance for depreciation on the property as in the case of buildings used for business.

Question 74.—Is any change required in respect of provisions relating to carry-forward of losses? Are you in favour of allowing losses to be carried backward in case of cessation of business?

Under the law as recently amended, the provisions relating to the carry-forward of losses are satisfactory. It should, however, be possible to carry forward a loss under one head and set it off against any normal income in future years, other than gambling income. It should also be permissible for losses to be carried backward in the case of cessation of the business.

Question 75.—Do the provisions relating to the payment of advance tax under section 18A of the Income-tax Act need any modification?

Yes. Section 18A assessments should be abolished as the circumstances justifying that provision have now disappeared. The money involved is almost invariably urgently required for the purposes of the business and if not immediately required would be temporarily invested. The advance payments place a heavy burden on industry to no purpose other than a temporary increase in the Government's cash position. Payment of tax on profits before they have been ascertained is indefensible under existing conditions of monetary stringency and the difficulty involved in framing advance estimates of tax is considerable.

Question 76.—Do the principles underlying the assessment under section 34 of the Income-tax Act need any modification?

The Chamber would not go so far as to urge the removal of the powers under Section 34 relating to income escaping assessment but deprecates the abuse of them which sometimes occurs, such as their use by an Income-Tax Officer to re-open an assessment made by his predecessor and accepted in good faith by the assessee merely because the Officer considers that his predecessor has handled the case incorrectly. This leads to a disturbing lack of finality which is unfair to the assessee. The section should not be used to remedy omissions or lack of knowledge on the part of an Assessing Officer.

Question 77.—What measures would you suggest for simplifying the procedure of assessment in order to reduce the cost of compliance with tax regulations?

The following:

- Abolition of the system of computing depreciation allowances based on the months in which the building is completed or the machinery installed (see answer to Question 62);
- Instructions to I. T. Os. to refrain (i) from the practices referred to in the Chamber's answer to Question 48, e.g., disallowance of legitimate revenue expenditure for the purposes of the business, (ii) from placing on the assessee the burden of supplying answers to irrelevant questions having no direct bearing on the assessment and (iii) repeating questions, however, relevant, which have already been answered;
- The training of a cadre of Income-Tax Officers imbued more with the spirit of service to the public and less with the idea that all assesses are tax-dodgers.

Question 78.—It has been suggested that the Appellate Tribunal should have powers to enhance assessments in the same manner as Appellate Assistant Commissioners have. What is your opinion?

The Chamber sees no justification for this suggestion. The powers of the Department under the law as it at present stands are adequate.

TAXATION OF COMPANIES AND SHAREHOLDERS.

Question 79.—Do you recommend that an element of progression should be introduced in the corporation tax?

No. The effect would be to encourage the subdivision of a growing and thriving company into two or more separate companies.

Question 80.—Would you advocate different rates for different types of corporate enterprises, e.g.—

- small industries;
- cottage industries;
- private limited companies or what may be termed proprietary companies;
- holding companies?

No.

Question 81.—There is a demand for the exemption of inter-corporate dividends from corporation tax. Do you consider this justified and, if so, why?

Yes. As was pointed out in the Chamber's previous memorandum, a large proportion of business has been

expanded in other parts of the world by means of subsidiaries and sub-subsidiaries of parent companies. It may be to secure an interest in competitive or substitute products, to assure supplies of raw materials or to secure a measure of influence in the marketing or distributing channels through which the products flow. This is a particularly convenient method to adopt when a new enterprise is started; but, even with the recent concession for newly formed companies in India, such an arrangement is one that a company promoter is not encouraged to adopt here so long as most companies have to pay super-tax on the dividends received from another company.

In the Chamber's opinion encouragement must be given to the formation of groups on the lines adopted in other countries and, with this object in view, the exemption of inter-corporate dividends from super-tax is necessary and justified.

Question 82.—Do you think that any special provisions are necessary for the assessment of—

- (a) banks; and
- (b) investment companies?

Do existing rules relating to assessment of insurance companies, especially mutual insurance associations, require any change? If so, in what respect?

There is a tendency to treat investment holding companies as dealers in shares and this should be remedied.

Question 83.—Do you think that differentiation should be made between distributed and undistributed profits of companies for tax purposes? If so, on what grounds? What change would you suggest in the present quantum of differentiation in favour of undistributed profits? Should the concession in future be restricted to particular industries?

If the tax concession in favour of undistributed profits is allowed to continue as at present or in a modified form, what measures would you suggest to ensure:

- (a) that retained profits are not used as a device by shareholders of private limited companies to evade super-tax;
- (b) that retained profits are actually applied for productive purposes?

In particular, are the provisions of Section 23A of the Income-tax Act satisfactory? If not, what changes would you suggest?

The principle of differentiation is sound but owing to piecemeal amendments to the Act the practical application of it leaves much to be desired. The Initial and Double Depreciation Allowances are merely a deferment of tax and not a reduction in the ultimate liability. In many cases of an expanding Company where heavy capital expenditure has been incurred and as a consequence of the initial and double depreciation allowances the assessable profits are small, if the dividend when declared is less than the assessable profits the holder of the risk capital may be discouraged and will not be prepared to invest in similar concerns in future. The Chamber feels therefore that in computing the profit for the purpose of rebate or excess dividends the initial and double depreciation allowance should not be deducted.

In the case of trading companies, whether public or private, it is for the benefit of industry and the country as a whole that profits should be retained in the business even though there may be some reduction in the super-tax paid by the shareholders.

With the proposed amendments to the Companies Act it is hoped that profits will be applied for the purpose of the business and not for extraneous matters and the Chamber feels that apart from these provisions each business should be allowed to use retained profits as it so desires with the consequent increase in subsequent profits.

As regards Section 23A which has been the cause of so much controversy ever since its introduction into the Act, the Chamber urges with all the emphasis at its command that this provision should be removed entirely or at least re-designed in such a way that it will not be applicable to companies carrying on a trading business and will include provision for exemptions in other cases where considered equitable. Section 23A was originally introduced to prevent the avoidance of super-tax by investment companies. It should continue to apply to such companies alone.

In any event the present section is unsatisfactory in the treatment of subsidiary companies. Subsidiary companies are within the scope of Section 23A unless the whole of the share capital is held by a company in which the public are substantially interested. Thus when a public company owns more than 99 per cent. of the shares and the balance is held by the Indian public the Section will still be applied. A further proviso is clearly required to the effect that the Section shall not apply when more than 50 per cent. of the share capital is held directly or indirectly by one or more companies in which the public are substantially interested.

Question 84.—Do you think, in view of the fact that profits distributed by a company are subjected to corporation tax, it is appropriate that they should also be charged to super-tax in the hands of shareholders? If not, what are your suggestions in this regard?

See answer to Question 66 which applies here also.

Question 85.—Would you consider that industrial, commercial and similar other enterprises undertaken by the Centre, the States and Local Bodies should be required to contribute, from their earnings in the way of income-tax or in other ways, to general revenues?

Yes, certainly.

Question 86.—What measures would you suggest for the greater use of the services of Chartered Accountants for assisting in the determination of the taxable income of assessee? What obligations should be placed on a Chartered Accountant when he certifies a statement of accounts of an assessee for purposes of income-tax assessment? In particular, with a view to minimising evasion of tax, would you recommend that the certificate of a Chartered Accountant should invariably accompany the return for business income over a certain limit? If so, would you suggest that a form of certificate should be prescribed indicating the scope of the check that should be exercised by Chartered Accountants who render the certificate mentioned above. Do you agree that fees payable by assessee to Chartered Accountants for such certificates should be restricted to a schedule to be prescribed by Government?

The primary function of Chartered Accountants is to certify accounts of limited companies for the purpose of the Companies Act and the Chamber would strongly oppose any proposal that this function should be extended to cover certification of accounts for the purpose of assessment to income-tax. When auditing the accounts of limited companies for the purpose of the Companies Act it is the practice of Chartered Accountants to accept certified returns from works, estates, etc., and in the case of many, and in particular the larger, companies to limit their examination of the books to tests of the transactions. Furthermore the detailed transactions are examined by clerks whose knowledge of income tax law is necessarily limited. In any event, the preparation and auditing of accounts for the purpose of the Companies Act differs in many respects from the preparation of an adjusted Profit & Loss Account for Income-Tax purposes.

The number of Chartered Accountants experienced in both auditing and income tax law is still very limited and is likely to remain so for many years while it must be appreciated that, unless the treatment of assessee by many Income-Tax Officers is changed, Chartered Accountants might be held to blame—and liable to the penalties provided by the Chartered Accountants Act, 1949—not only for any omission to disclose items which are manifestly disallowable but also for such items as the Income-Tax Officer may consider as not incurred for the purpose of the business.

Any form of certificate prescribed by Government would have to permit qualifications of the certificate by Chartered Accountants covering all the above points and in consequence would lose much, if not all, of its value.

The costs of Chartered Accountants vary very considerably and any schedule prescribed by Government would have to be based on those of the highest with the danger that the schedule would be applied in all cases even where the costs of the Chartered Accountant were not high and his experience limited.

The Chamber is therefore of the opinion that in any event no schedule of fees should be prescribed by Government for any work done by Chartered Accountants for income-tax purposes.

Question 87.—What changes would you suggest in the present law relating to the representation of assessee before Income-tax authorities (section 61) in order to ensure—

- (i) effective representation of assessee at reasonable fees,
- (ii) a minimum level of proficiency on the part of representatives regarding the subject of income-tax law, rules and regulations?

In the Chamber's view it must be left to the assessee himself to select his representative and to the parties concerned themselves to settle the fee which must be fixed with reference to the circumstances of the particular case involved. These are not matters that can be governed by legislation; nor can legislation create proficiency. The existing provisions of Section 61 appear to the Chamber to be adequate.

Question 88.—Will it assist in checking evasion if the names of the persons who are penalised for concealment of income are published?

On the whole the Chamber is inclined to think this will assist but holds no strong view on the subject.

Question 89.—Do you think that the present practice of excluding from taxable profits, perquisites given to employees of business undertakings results in considerable loss of revenue? If so, please state the perquisites you have in mind, and how they should be dealt with for the purposes of taxation.

No, the revenue involved is inconsiderable and the Chamber would deprecate, as it did in 1951, any proposal to change the law in this respect. In so far as items such as free medical attention, passage costs, office canteen lunches and the like are concerned—and these presumably are the type of “perquisites” this question has in view now that the question of free housing has been settled—it is necessary to bear in mind that these form part of the terms of service of the employee for the benefit of the business in earning profits, are not convertible into cash by the employee and many of them are in one form or another applicable to industrial labour as well as to other staff.

Question 90.—In the case of a company under liquidation, what steps, if any, would you suggest for safeguarding payment of tax dues before any payments are made to shareholders?

In the Chamber's opinion this is a matter for treatment under the Indian Companies Act and not in the context of taxation legislation.

Question 91.—Do you think that, in order to minimise evasion and avoidance of tax, there is a case for conferring larger powers on income-tax authorities? If so, what further powers should be given to them? In particular, should powers to search premises and seize documents and books of accounts be given to Income-tax authorities? If so, what is the lowest grade of officer on whom you would confer these powers?

No. The existing powers are sufficient. The Chamber sees no good reason why all assessee should be classed as dishonest and therefore made subject to wide, far-reaching powers against which, even in their misuse, there is no remedy under any of the laws of the land.

Powers to search premises and seize documents and books of account should not be given to Income-Tax authorities. It should be sufficient in the opinion of the Chamber to empower the Income-Tax authorities to compel the production of relevant documents, the retention of which should be subject to a stated and reasonable maximum period.

Question 92.—What precautions are necessary and possible to prevent the creation of an artificial legal entity—a trust or a private limited company or a partnership, especially family partnership—either for avoiding payment of income-tax or for fractioning of income to escape higher rates? Would you recommend the use of penalty rates of tax to minimise such practices?

Though the Chamber finds it difficult to visualise the abuses which this question may have in mind, it sees no reason why liberty to form trusts, private limited companies or partnerships, should be interfered with provided there is no evidence of tax evasion.

RECOVERY.

Question 93.—In the case of a registered firm, would you advocate recovery of unrealised tax of any partner from the firm as such or from other partners?

Yes. But if any change in the law is necessary it should be restricted to the recovery of tax at the rate applicable on the income of the partner from the registered firm.

Question 94.—Are present arrangements relating to recovery of income-tax adequate? Would you advocate the Income-tax Department having a separate machinery for enforcing the recovery of arrears of tax?

In the Chamber's opinion, yes. In answer to the second part of the question, the view of the Chamber is that adequate machinery for this purpose already exists in the form of powers of collection and certification.

Question 95.—What provisions should be made to ensure timely collection of tax from private limited companies? Do you consider that liability for payment of tax in such cases should be placed upon shareholders of the company in proportion to their shareholdings?

The question indicates an attitude towards private limited companies which seems to the Chamber to be quite unjustified and which is to be deprecated. Please see in this connection the Chamber's reply to Question 83. The Chamber's answer to the second part of Question 95 is definitely in the negative: there is no possible justification in the Chamber's experience for such a suggestion.

Question 96.—If income from any property is included for assessment purposes in the hands of a person

other than the ostensible owner, would you agree to the tax so assessed being also made recoverable from such property?
Yes.

GENERAL.

Question 97.—What concrete measures should be taken to improve the relations of the Income-tax Department with assessee, especially in regard to—

- (i) provision of free advice to small assessee on the following points:
 - (a) maintenance of accounts in a form acceptable to the Income-tax Department; and
 - (b) matters such as filing returns of income, claiming refunds, facilities for tax payment, expeditious disposal of assessments, etc.;
- (ii) provision of information on various matters relating to assessment proceedings, such as, disposal of refund applications, adjournment applications, examination of records, etc.;
- (iii) arrangement of work so as to obviate the necessity of assessee or their representatives having to wait in Income-tax Offices for unduly long periods; and
- (iv) securing of the largest measure of agreement on facts between the assessee and the department at Income-tax Officer level?

The remedy is more one of bringing about a change in the attitude of the Income-Tax Department staff towards assessee in general than of “concrete measures”. As has been observed in reply to Question 77, the preferable course is the training of a cadre of Income-Tax Officers imbued more with the spirit of service to the public and less with the idea that all assessee are dishonest tax-dodgers who are on no account to be helped in determining their liabilities under the Act. In so far as specific remedies are possible, the following might be considered:—

- (i) The provision of more Public Relations Officers in the Department and Income-Tax Officers specially designated to help the public in these directions, with authority to discuss an assessee's difficulties without the inquisitions customarily associated with assessment proceedings.
- (ii) Notices to assessee to produce records, to answer questions, etc., should give more reasonable time and should be delivered with greater promptness when a time limit is prescribed.
- (iii) Income-Tax Officers should be encouraged, or instructed, to organise their programme of work in such a way as to enable them to adhere to the time-table of their appointments with assessee as an ordinary courtesy to the public. In particular, they should avoid being engaged with I. A. Cs. at times of their appointments, as so frequently happens, and making appointments with several assessee at the same time or at such short intervals that they are unable to adhere to the appointed hours.
- (iv) The remedy, as already pointed out, is a more reasonable and less suspicious attitude towards the assessee, better training of, and more, staff.

Question 98.—What changes would you suggest in the existing arrangements relating to:

- (i) issue of notices;
 - (ii) simplification and filing of returns;
 - (iii) levy of penalties;
 - (iv) recovery of tax; and
 - (v) appellate procedure and machinery, particularly with reference to administrative control over Appellate Assistant Commissioners?
- (i) The existing arrangements relating to the issue of notices is satisfactory except that there is frequently an unnecessary time-lag between their dates and their delivery to the assessee concerned.
 - (ii) There should be fewer changes in the form of return than the almost bewildering number of recent years.
 - (iii) There is a tendency, which should be discouraged, to unreasonable recourse to the imposition of penalties.
 - (iv) When it is made plainly known to the Income Tax Officer that the assessee intends to appeal against a decision of the Income-Tax Officer, the latter should hold up demands until the decision of the Appellate Assistant Commissioner or higher Appellate Authority is issued. More reasonable time should also be given in which to make payment of the tax ascertained to be due—occasionally at present as brief a time as three days.
 - (v) Appellate Assistant Commissioners should be wholly detached from the Central Board of Revenue and

should form part of an independent body such as the Appellate Tribunal. Appeals before the Appellate Assistant Commissioners cannot and will not be regarded as satisfactory so long as the officers in question continue to be in a position in which their future progress in the department may be prejudiced if too many of their decisions are in favour of assessees.

Question 99.—(a) Do you think that undue delay occurs at present in the course of assessment proceedings? If so, what do you attribute this to and what are your suggestions for remedying this?

(b) In order that delays of the kind mentioned above do not appreciably affect collection of a substantial portion of the tax due, should any special concessions be provided to assessees to induce them to make advance payment of tax?

(a) Yes. These unnecessary delays are frequently attributable to Section 18A Advance Payments, and provincial assessments under Section 23B being left indefinitely in this provisional state; reluctance of Income Tax Officers to deal with assessments involving losses, or refunds of tax; inattention or delayed attention to the completion of assessment in which agreement has been reached with the assessee; the disinclination of Income Tax Officers to proceed to assessment where a point of doubt is involved and the apparent reluctance of the Central Board of Revenue to give definite instructions in such cases. The remedies are more definite guidance and fewer restrictive directives on the part of the Central Board of Revenue; the positive encouragement of initiative and decision on the part of the Income Tax Officer in doubtful cases; the prescribing of a time limit within which assessments should be completed or referred to the Commissioner for orders and a relentless drive for the completion of long-outstanding assessments; better training—in selected cases by giving them experience overseas of modern methods; and the provision of more and better trained subordinate staff to relieve Income Tax Officers of routine work which limits their accessibility and service to the public.

(b) Only to the extent of the restoration of a higher rate of interest on advance payments of tax, the reduction of which has discouraged prompt completion of assessments; and, as already suggested, a concentrated drive to complete longstanding assessments.

SPECIAL BUSINESS TAXES.

Question 100.—What in your opinion, would be the circumstances which would justify the levy of Excess Profits Tax or Special Business Taxes?

Only the occurrence of emergency conditions such as those brought about by war.

DEATH DUTIES.

Question 101.—What are your main reactions to the Estate Duty Bill at present before Parliament?

As the Estate Duty Bill is almost certain to be passed into law before this reply to the Taxation Enquiry Commission's questionnaire is considered, this particular question is largely academic until actual experience has been gained of the operation of the Act. In these circumstances the Chamber does not think it necessary to re-state the objections to the Bill in general, and in particular to Clause 80, but wishes to emphasise most strongly the absolute necessity for agreements with other countries for the avoidance of double estate duty.

Question 102.—Would you in the matter of rates of levy differentiate between self-acquired property forming the estate of a deceased and property inherited by him?

No.

PART III.—COMMODITY TAXES (Central and State). Customs.

Import Duties.

Question 103.—Do you think that any changes are necessary in the Indian Customs Tariff in respect of—

- (i) grouping of commodities;
- (ii) additions to and alterations in tariff items;
- (iii) correlation with the Import Trade Control Schedule;
- (iv) clarification in nomenclature and in units of measurement or weight?

(i) Although the existing Customs Tariff works reasonably well and does not generally involve importers in great or continuing difficulties, there are undoubtedly anomalies in methods of classification and grouping. For instance, it is sometimes found that the rates of duty applicable to machinery items are different from those applicable to ancillary materials and parts which are essential for the working of machinery. The existing tariff is therefore by no means perfect and it is an open question whether or not it would be desirable for Government to undertake a complete revision. On the one hand, there must be a natural reluctance to depart from a system which works reasonably satisfactorily, and the

introduction of a completely new tariff would inevitably cause difficulties and misunderstandings in the initial stages until such time as the changes were fully understood by all concerned. On the other hand, as stated, there are anomalies in the present tariff and, having been introduced about 20 years ago, it has in the course of time become defective and out of date in the context of modern manufacturing techniques and the increased variety of goods in international commerce.

Should Government decide to investigate the possibility of introducing a revised tariff, the Chamber would draw attention to the fact that during the past few years the subject of tariff nomenclature has been intensively studied by a group of Customs experts drawn from a number of countries in Europe. Their conclusions are embodied in a Draft Revised Tariff Nomenclature, published in Brussels in July 1950, which is in fact a greatly improved version of the schedule on which the present Indian Customs Tariff is based. The improvements include some re-grouping of commodities and a number of additions to and alterations in tariff items, notably in regard to chemicals, textiles, metals and machinery; and the whole may be taken as a consensus of independent expert opinion as to the form which a comprehensive Customs tariff ought to take. If it is decided that the balance of advantage lies in favour of adopting a new tariff in India, the Chamber would suggest that this draft would be the most suitable basis of review.

(ii) The Chamber's remarks with regard to the adoption of a revised tariff cover also the question of additions to and alterations in tariff items. There is one particular complaint which has been brought to the Chamber's notice in this connection however and which, apart from the general question or whether or not a thorough revision of the tariff is necessary, should receive Government's early attention. Item 87 of the Customs Tariff is a miscellaneous item under which all new goods, or goods which cannot conveniently be classified under other items, are placed. The result is that it is now a very bulky item and includes a wide variety of goods which are entirely unconnected. It is submitted that this practice is wrong and that, even though it may be necessary to retain such a miscellaneous item for dealing with new commodities when they first enter into the trade of the country, their inclusion should only be temporary and they should be given a proper place in the tariff as soon as possible. Item 87 in its present form requires revision at an early date.

(iii) In the Chamber's opinion, a close correlation between the Customs Tariff and the Import Trade Control Schedule is essential if the import trade control system is to work efficiently. Indeed, such correlation is considered more important than the question of revising the Customs Tariff, for while the Customs Tariff works reasonably well for purely Customs purposes, there is no doubt that frequent and serious difficulties are caused by disputes about classification arising from the fact that the tariff on which Customs Officers base their assessments of imports is different from that which the control authorities use for the issue of licences. As the Chamber has said, correlation between the two is essential. The best means of its achievement is a matter for expert opinion but the Chamber would direct attention in this connection to the views which were conveyed to the Ministry of Commerce & Industry towards the end of 1952, when Government were proposing to draw up a completely new Import Trade Control Schedule and appointed an Officer on Special Duty for that purpose.

(iv) The units of weight and measurement now employed in the Indian Customs Tariff have been in use for many years and are clearly understood by all engaged in the import and export trade. Any major change in these units would only cause dislocation and inconvenience and would entail substantial expenditure on weighing or measuring appliances.

Question 104.—(i) What considerations should govern the fixation of rates of import duties for different groups or sub-groups of commodities or for special tariff items?

(ii) Have you any modification to propose in the present rates of duties in the light of the considerations suggested by you?

(iii) Do you consider that import duties should be reduced in respect of any specific commodities in order to reduce the scope for smuggling?

(iv) Are there any cases within your knowledge where duties on the constituent parts are higher than on the finished products? Is there adequate justification, in your opinion, for this differentiation?

(v) Do you think that owing to high rates of duties the yield on any commodity has reached the point of diminishing returns?

(i) The primary purpose of a Customs tariff being to raise revenue, the basic consideration in fixing rates of duty must of course be the amount of revenue required. Where protection is not involved, the rates can be deter-

mined by the principles ordinarily governing taxation, the weight of taxation being fairly distributed over the whole body of imports and the incidence being equated between goods of a similar character or which may compete with one another. In general, goods necessary to life should be taxed as lightly as possible, and special consideration should also be shown to raw materials and to semi-manufactured goods which require further manufacture in India before going into consumption.

The principles which ought to govern the fixation of duties on goods requiring protection and on goods on which preferential rates of duty are conceded were laid down by the Indian Fiscal Commission of 1921-22, and they have not been invalidated during the years which have since elapsed.

Over and above the technical considerations, the effect on the taxpayer should be kept constantly in mind and care should be taken to protect the consumer from too heavy a burden and to avoid allowing the cost of living to rise so high as to increase production costs in India to the point of handicapping her export trade.

(ii) On the whole, the present structure of import duties conforms to the principles described above and the Chamber does not think that any thorough or far-reaching revision is necessary. There are of course individual anomalies, and the Chamber would quote the following three complaints which have been brought to its attention and which require remedy—

(a) Manually-operated machines are assessed to duty at 31 per cent. whereas power-operated are assessed at 5½ per cent. It is difficult to see what grounds there are for this distinction and it is suggested that, in the light of Government's desire to encourage cottage and small scale industries it is undesirable that an excessively high duty should be imposed on manually-operated machines, since it is particularly in the small industries that such machines find a use.

(b) Passenger lifts are assessed at 25 per cent. and goods lifts at 5½ per cent. Again, it is difficult to see the reason for the differentiation, and in addition this difference may well lead to attempts to evade the high rate of duty by misdeclaration.

(c) A serious blemish in the thirty-seventh issue of the Indian Customs Tariff is that the addition of a surcharge in 1951 has resulted in awkward fractions (e.g., 19. 17/32). These should be rounded off.

(iii) The Chamber has little information on this subject but it has been suggested to it that the duties on watches and on silk and art silk are so high as to encourage smuggling and should therefore be reduced.

(iv) The Chamber does not know of any such cases, although that of course does not rule out the possibility of their existence.

(v) In the case of fork lift trucks the yield has not reached the point of diminishing returns for the simple reason that, owing to an excessive rate of duty, hardly any yield has in fact begun to accrue so far. Fork lift trucks are classified by the Customs as vehicles and assessed to duty at 31½ per cent. This, in the Chamber's opinion, is wrong and they should either be assessed at 5½ per cent. as mobile cranes or should be given a separate tariff number at a reduced rate of duty. Certainly the present high rate of duty is acting to prevent almost completely the importation of this valuable modern equipment. Representations for a reduction in the duty which were made to the Central Board of Revenue several months ago were turned down without any explanation.

Question 105.—Is the relative use of *ad valorem* and specific duties in the Indian Customs Tariff satisfactory? If not in what respects would you enlarge or restrict the scope of application of either, whether used singly or in combination?

Specific duties have certain obvious advantages over *ad valorem* duties: they save time and labour in valuation and assessment, both to the importer and to the Customs authorities, they afford greater certainty as to the amount of duty payable, and they ensure uniformity of assessment between one consignment and another. Unfortunately because India's imports include a high proportion of manufactured goods with a wide range of values, it is inevitable that her tariff should retain a high proportion of *ad valorem* duties; and the Chamber accordingly doubts if at present there is much scope for an increased use of specific rather than *ad valorem* duties.

The Chamber would suggest, however, that Government might bear prominently in mind the advantages which specific duties have as a means of counteracting unfair trade practices on the part of other countries, such as "dumping". When exporting countries resort to the "dumping" of their products at extremely low

prices, as was a common practice before the second World War, *ad valorem* duties become inappropriate because they add so very little to the reduced price, and in such circumstances specific duties provide the only form of protection.

Question 106.—(i) In what circumstances would you consider "tariff values" a satisfactory basis for assessment of import duties? (Section 22 of the Sea Customs Act.)

(ii) Are there any commodities to which you would extend the application of "tariff values"?

(iii) What changes, if any, should be made in the procedure for determining "tariff values"?

(i) The fixation of "tariff values" for imported goods is an appropriate procedure in the case of items which may be imported under various descriptions or trade names but which are physically the same commodity or have the same constituents; certain chemicals are a case in point. It is desirable that such items should be assessed to Customs duty on a uniform basis but the different descriptions under which they are imported make this difficult and also provide scope for under-invoicing; the problem can best be met, as stated, by the fixation of "tariff values". Again, where the values of particular imports fluctuate materially but are nevertheless readily ascertainable by market enquiries, the assignment of "tariff values" is a useful device.

(ii) As far as the Chamber's information goes, the present selection of items to which "tariff values" are applicable is satisfactory.

(iii) The existing procedure for the determination of "tariff values" would also seem to work quite well and to give interested parties an adequate opportunity of expressing their views.

Question 107.—(i) What changes in your opinion are necessary in the present provision (sec. 30 of the Sea Customs Act) regarding the determination of "real value" and why?

(ii) Would you suggest any specific measures to counter the evasion of import duties through deliberate under-valuation?

(iii) Have the methods of valuation in the Sea Customs Act proved satisfactory in relation to trade through the land customs border, especially on the Indo-Pakistan border? If not, have you any specific suggestions to make in this regard?

(i) The valuation of imports for Customs purposes always presents extremely difficult problems and has been the subject of prolonged controversy in many countries. In the Chamber's opinion, the existing Indian practice for the determination of "real value" works reasonably well. It would be unwise to depart from it and would in all probability merely give rise to fresh complications and problems.

(ii) The Chamber has no suggestions to make on this subject.

(iii) Again, the Chamber has little information and has no comments to offer.

Question 108.—What changes would you suggest in the matter of granting exemptions from, or reductions in, import duties especially in regard to:

- (1) raw materials used for essential industries;
- (2) materials used for scientific research;
- (3) materials imported for charitable and humanitarian purposes;
- (4) materials imported for stimulating desirable activities, such as agricultural development; and
- (5) necessities of life?

In general, the Chamber has no specific changes to suggest and would only remark that, in the context of official Government policies, anomalies do occur in the grant of exemptions from and reduction in import duty. In reply to question 104 the Chamber has drawn attention to the discrepancy in the rates of duty for manually-operated and power-operated machines. The former are assessed at a substantially higher rate than power-operated machines although, since they find an important use in cottage and small scale industries and since it is Government's declared object to promote these industries, there would seem to be a case at least for an equalisation of the rates, if not for the grant of some special concession to manually-operated machinery.

Question 109.—To what extent do you think revenue might be satisfied in the interests of bilateral or multilateral fiscal arrangements such as GATT or the preferences in favour of certain Commonwealth countries.

Revenue should only be sacrificed in return for some material gain, as for example in an exchange of preference.

Question 110.—Under what circumstances should customs duties be used in preference to import quotas as a means of restricting imports?

As a means of restricting imports for the purpose of conserving foreign exchange, the imposition of Customs duties has two main advantages over a system of physical controls: in the first place it eliminates all the labour, trouble and expense involved in the present import licensing system; and in the second, by merely raising the price of the imported article in preference to prohibiting or limiting its importation, it leaves some element of choice with the consumer inasmuch as the imported article is available to him provided he is prepared to pay the price. Although these are substantial advantages however and must have attractions both for Government and the trade, the Chamber does not think that, taking all things into consideration, it is better to regulate the use of foreign exchange by import duties rather than by a system of physical controls. Customs duties are an inflexible instrument and are often maintained long after the need for them has disappeared; secondly, it would be very difficult to determine the precise rate of duty necessary to achieve the desired result and it is not easy to see exactly how this decision would be taken; and finally, abnormally high rates of import duty would provide scope for the exploitation of the market by the indigenous manufacturer and would be detrimental to the consumer and, in the long run, to indigenous industry itself. In view of these circumstances, the Chamber is of the opinion that, for exchange regulation purposes, the balance of advantage lies with the maintenance of physical controls in the form of an import licensing system. The Chamber is opposed to the use of import duties as a means of import control.

The use of import duties as a means of granting protection to indigenous industries is a different question and, in the Chamber's opinion, is quite legitimate. It is essential however that import duties should not be used with this object until a detailed enquiry into the facts of the case has been carried out by an impartial and quasi-judicial body. This function is at present performed satisfactorily by the Tariff Commission and a reference to the Commission should always precede any grant of protection.

Question 111.—In what respects should the present law regarding "drawbacks" and "warehousing" be altered in order to assist the export trade in manufactured goods which involve the use of imported raw materials?

Situated as she is, at a focus of communications to all parts of the Eastern hemisphere, India is in a position to build up an extensive entrepot and export trade and it is essential to the full development of her economy that customs facilities should be provided wherever necessary for merchandise despatches from India, both for re-exports and for goods partly manufactured in India. For this purpose the drawback and warehousing provisions must allow remission of duty on goods re-exported in the same state as when imported, whether re-exported by the original importer or by a purchaser and for similar relief in respect of high duty goods absorbed in the manufacture of goods which are then exported. The existing facilities provided under these sections of the Customs and Excise law seem adequate.

Question 112.—Have you any suggestion to make regarding the administration of the Sea and Land Customs Acts, especially in regard to:

(a) facilities for settlement of disputes arising out of appraisement;

(b) penalties imposed under the Act and the appellate procedure relating to them?

(a) Whatever may be the actual machinery adopted for the settlement of appraisement disputes, the Chamber considers it most important that differences about appraisement should not be allowed unnecessarily to impede the clearance of goods from the docks. In particular, it is completely wrong that, as sometimes happens, the clearance of a large consignment should be held up because of a dispute about the appraisement of a small part of it; either the consignment should be released under bond and the dispute settled subsequently, or that part of the consignment which is outside the scope of the dispute should be permitted clearance.

(b) Penalties for infringements are imposed in a rapidly ascending scale according to the number of infringements committed by the importer concerned. The Chamber would suggest however that there should be a time limit, after the expiry of which a previous infringement will be left out of account in the fixation of penalties for subsequent breaches. It would point out in this connection that Government regulations are nowadays so numerous and complicated that, with the best will in the world, it is practically impossible for even the most honest importer to avoid committing an offence at some time or another. Frequently, these offences are little more than technical breaches and it is not fair that an honest importer should be subject to

steeply increasing penalties irrespective of the frequency with which the offences occur. As the Chamber has suggested, it would be equitable if a time limit were fixed after which earlier offences would not be taken into account; and it accordingly strongly recommends the adoption of this measure.

Export Duties.

Question 113.—Under what circumstances, in your opinion, should export duties be imposed?

Export duties are a menace to the country's existing export trade and to its future prosperity. Even in the case of a raw material or manufactured articles in which the exporting country has a monopoly, the recourse to export duties causes resentment on the part of the foreign consumer and a search for substitute materials. If, on the other hand, the goods concerned are not a complete monopoly, but represent a very large portion of the total world supply, the export tax can still probably be passed on to the consumer, but the rise in prices will act as a bounty to competing manufacturers from other countries who will in addition by under-cutting always be in a position to sell their total production. The increase in prices may also lead to the forfeiture of goodwill and will stimulate attempts to find cheaper substitute materials. Finally, in the case of export goods in which there is considerable world competition, the export tax will probably not be passed on, will become in fact a tax on the exporter and will in the long run reduce exports.

In many cases it has been claimed as a justification of export duties that they are a temporary measure to deal with a temporary situation. It is general experience, however, that once such duties have been imposed it is a matter of great difficulty to ensure their withdrawal and that they tend to continue long after any economic justification there might have been originally has disappeared. Such a position can rapidly cause intense and possibly permanent damage to foreign markets.

The experience of the jute goods industry in this country during the last four years is a classic instance of the dangers inherent in the imposition of an export duty. Although the jute industry in India produces a large proportion of the total world production of manufactured jute goods, it never was, and today is very far from being, a monopoly producer. The greater part of the world raw jute supplies is grown in Pakistan; there is an important and efficient jute mill industry in the United Kingdom and in the Continent of Europe and a developing industry in Pakistan. As a packaging material the leading position formerly held by jute goods in the United States markets has now been taken over by paper bags and there is keen competition from paper, cotton and other textile materials in other markets of the world. Finally, the method of packaging in bags has been seriously affected by the growing use of bulk handling over the greater part of American agriculture and in many industries and trades.

The rate of export duty on Indian Hessian was Rs. 32 per ton in 1946. From 1947 to 1949 it was Rs. 80 and thereafter it increased by rapid stages till it stood at Rs. 1500 per ton in 1950. This very high rate of duty which at one time represented 76.1 per cent. of the Calcutta selling price was maintained till February 1952. In May 1952 it was reduced to Rs. 275 and in September 1953 to Rs. 120.

The main purpose of the duty was to absorb the large profits which were alleged to be available to shippers and importers as a result of the high prices of jute goods following the shortage in raw jute in 1949 and 1950. This it may have done but the immediate reactions in foreign markets were:—

(1) violent resentment on the part of consumers against the Indian Government and the Indian jute industry accompanied by a considerable loss of goodwill;

(2) a rapid switch over on the part of many consumers to alternative packing materials, particularly in the United States;

(3) an immense stimulus to the European jute manufacturing industry which was enabled to dispose of its entire exportable surplus to the United States at the very high rates then prevalent and which was, as a result, enabled to carry out a considerable measure of re-equipment and rehabilitation;

Despite the reduction of the duty in 1952, the proportion of the North American market held by Indian exports of hessian has never recovered and during the first five months of 1953 was only 77.2 per cent. as compared with 96 per cent. in 1947. The imposition of export taxes on other important export commodities such as tea, hides and skins, linseed oil, coal etc., have, though on a smaller scale, all been hindrances to the development of India's export industry.

The Chamber is, therefore, very strongly opposed to the imposition of export duties and is of the opinion that there is a strong case for their complete withdrawal, particularly in the case of exports of jute goods.

Question 114.—*What measures would you suggest to achieve greater flexibility in the rates of duties to accord with the changing conditions of export markets?*

As indicated above, it is one of the great disadvantages of export duties that they tend to be inflexible and they also tend to be retained long after changing conditions justify their removal. In default of complete removal, the Chamber can only urge that Government should show a greater awareness of the need for rapid adjustment in changing trading conditions, but so long as the duties are measured not only by their effect on export trade, but also by their efficiency as revenue earners, it is unlikely that there will be that quick response to altered circumstances which is so desirable if exports are to be maintained.

This question itself is a recognition of the dangers inherent in export duties. There should be no compounding with policies involving problems of this order. The dangers are too serious to be trifled with, particularly in the highly competitive conditions which are now beginning to characterise world markets.

Question 115.—*Would you suggest that the whole or a part of the receipts from certain export duties should be founded for financing schemes for promoting long range development of the export trade, subject to the obligations under GATT?*

The Chamber is opposed to any schemes of this nature. Finance required for the development of particular industries or export trades should be provided from general revenues.

Question 116.—*Would you, in the interests of revenue or from any other point of view, recommend increased participation by the State in import and export trade? If so, what form do you think should such participation take?*

The Chamber is strongly opposed to participation by the State in the import and export trade. World commerce is now rapidly returning to highly competitive conditions and experience of State trading and barter transactions during the war years and since has shown conclusively that the State lacks both the knowledge and the capacity to deal competently with what in such circumstances must be the final criterion, namely the satisfaction of the requirements of the individual customer. The many complaints which have been received since the war about the quality of Indian goods emphasise that only the skilled and careful attention of export specialists combined with the advantages of modern research and marketing methods will retain India's trade in many markets in which she was once supreme. The Chamber cannot too strongly emphasise that State trading is not only certain to lead to smaller revenues from exports, but in fact is very likely to lead to the extinction of the trades which provide them.

Similar objections can be made to the proposal that there should be State participation in the import trade. The Government of India has had many recent examples of the difficulties and embarrassments which are attendant upon efforts to arrange for foreign purchases by inexperienced Government officials or agencies and of the serious financial losses which may result.

Central Excises.

Question 117.—*Do you regard as satisfactory the present selection of commodities for purposes of levying excise duties? If not, what changes would you suggest and why?*

The Chamber has no alterations to suggest in the present list of commodities on which excise duties are levied.

Question 118.—(i) *Have you any changes to suggest in the present rates of excise duties?*

(ii) *Are the provisions regarding valuation satisfactory where ad valorem excise duties are levied?*

(i) The Chamber has no particular comments to make on the rates of duties which are levied under the existing excise arrangements, but they would urge that, in any revision of the excise system, two important matters should receive attention. In the first place, as a result of the manner in which the excise duties have developed, as in the case of tobacco, the duties are in many cases extremely complex, of an arbitrary and illogical incidence, and frequently prevent the orderly expansion of production. The Chamber considers that the opportunity should be taken, in consultation with the particular interests concerned, to rationalise and simplify, as far as possible, the different categories of excise

particularly in the case of the match industry, adopted the principle of differential rates for manufacturers falling into different categories. The Chamber considers that it is undesirable in principle for differential rates of excise duties to be charged on this basis, and strongly urges that in the interests of sound taxation policy excise duties should be levied at a uniform rate and without differentiation as between producer and producer.

(ii) The Chamber has no particular comments and has not been informed of any difficulties arising out of this question.

In its opinion, however, any extension of this system to the tea industry should be strongly opposed as it is considered that excise duty should be maintained at a flat rate per pound of tea. The reason is that the highest prices are fetched for hill grown teas, particularly Darjeeling, and in these areas the cost of production is highest.

Question 119.—*Do you think that the differential rates of duty on different types of unmanufactured tobacco other than flue-cured, should be replaced by a uniform rate of duty? Have you any other suggestions regarding the tobacco excise tariff?*

The Chamber considers that the differential rates of tobacco excise duty should be maintained, and would in this connection invite the attention of the Commission to the views expressed by the Imperial Tobacco Company, of India Ltd. in their Memorandum on this matter submitted directly to the Commission.

Question 120.—*Do you think that the lower rate of duty on the cottage match industry has been helpful to its development? If not would you suggest any change in the existing rates of duties?*

The Chamber has been informed that the lower rate of duty on the cottage match industry has been of assistance to its development.

Question 121.—*Do you think that the arrangements for the assessment and collection of excises in respect of manufactured and unmanufactured commodities require simplification? In particular, please comment on the present system as regards;*

- (a) licensing
- (b) warehousing, and
- (c) transport

of excisable commodities.

The Chamber has no comments save that it has been brought to its notice that Excise Officers in the case of the tea industry do not permit managers full discretion to decide what tea waste and residue tea should be destroyed. The Chamber supports the view of the tea industry that managers should have full discretion to decide what tea waste and what residue teas should be destroyed, or cleared as tea waste after denaturing, and that the duty of the Excise Officers in this connection should be simply to verify the quantity of tea or tea waste destroyed and to ensure that no residue tea escapes out of the garden without paying duty.

Question 122.—*Do you agree that a part of the excise duties may be earmarked for expenditure on research and development schemes designed to improve the quality and marketability of the commodities?*

Yes. Subject to replies to questions 8 and 9.

Question 123.—*Do you think that the imposition of excise duties has affected adversely the development of industries producing excisable commodities e.g., their size and competitive capacity in export markets?*

It is not considered that the imposition of excise duties as such has seriously affected the development of the industries concerned, but attention is drawn to the reply to question 118(i).

There is, however, no doubt that in the case of export commodities during periods when world markets are adverse to the seller, the additional costs involved have tended to prevent the expansion of the market.

Salt Duty.

Question 124.—*Would you recommend the re-imposition of the excise duty on salt? If so, on what conditions?*

The Chamber is strongly in favour of a re-introduction of the salt duty, since this is in line with its recommendation that all legitimate sources of revenue should be tapped and, with that object, that there should be an extension in the field of indirect taxation. A salt duty, like other forms of indirect taxation, would have the great merit of enabling substantial amounts of finance to be raised by means of a relatively slight imposition which in itself would involve very little burden; and, since the mass of the population—the agriculturists and industrial workers—are enjoying a degree of prosperity which

whole they are in a position to pay a duty on salt without hardship and without genuine cause for grievance. Unfortunately, the salt duty has been the subject of violent political controversy in the past and its re-introduction would almost inevitably arouse strong agitation. Consideration should therefore be given to the best means of avoiding such undesirable controversy in the event of the duty being re-imposed, and the Chamber would suggest in this connection that the answer might be to bring salt within the scope of sales tax instead of re-introducing the duty as a specific duty on salt.

TAXES ON THE SALE OR PURCHASE OF GOODS AND ON ADVERTISEMENTS.

GENERAL.

Before attempting to answer separately questions 125 to 134 it will be convenient to deal generally with the growth of sales tax leading up to the position as it now exists and the remedies proposed by the Chamber.

When sales tax was first introduced it was based on the single-point system, the tax being payable on the sale by the registered dealer to the unregistered dealer or consumer. Later, some States adopted the multi-point system and/or combinations of the two systems. Then, to remedy the confusion and difficulties created by differing laws in the several States, Article 286 of the Constitution of India was enacted; but a last-minute addition to that Article not only failed to achieve simplification but actually added to the difficulties previously experienced.

A comprehensive interpretation of the provisions of Article 286 of the Constitution has yet to be given by the Supreme Court. That Court has ruled that Article 286(1) of the Constitution lays down the principle that the State that has the sole and exclusive power to levy a sales tax is the State in which the goods have actually been delivered as a direct result of the sale for the purpose of consumption in that State. However it has not been made clear that only a trader with a place of business within that State can be assessed on his sales in that State. It would be necessary to establish this latter point to restore to Article 286(2) the meaning assumed to have been intended by the framers of the Constitution, namely that the imposition of a State sales tax on a sale of goods taking place in the course of inter-State trade or commerce is prohibited up to the time that the goods are resold in a State by a dealer carrying on business in that State for the purpose of consumption in that State.

Very considerable difficulty arises in the case of the commercial and industrial community as sales tax legislation differs from State to State so that there is a complete lack of uniformity between the several States as regards the rate of tax, the method of application and the goods to which it is applied. Certain goods may be assessed to State sales tax after assessment to Central Excise Duty. Certain goods may be exempted from sales tax in one State but not in another. In some States certain goods may be classified as luxury goods and subjected to a rate of tax higher than other goods. Raw materials for use in a process of manufacture may be taxed in one State but not in another. Goods sold under established trade marks and intended to be sold in small units at fixed prices related to the coinage of the country common throughout the Union of India have to be retailed at different prices in different markets dependent on the local taxation effective at each point. The result is a dislocation of normal trading and the encouragement of abnormal movements of goods from markets with lower tax rates to markets with higher tax rates, leading to extensive evasion of tax. The commercial and industrial community has been put to very considerable trouble and expense in order to ascertain its liability to tax in all cases where its trade or business extends beyond the boundary of a single State.

The minimum remedies to remove some of the foregoing difficulties and make the levy of sales tax feasible are uniformity of rate, character and incidence throughout the Union of India and the restriction of a State's jurisdiction to persons carrying on business within its own boundaries. Even then, however, complications and administrative difficulties would persist if a single-point tax is imposed. Involving as it does the classification and registration of dealers and legislation as to the points at which different types of transactions are to be taxed, the single-point tax is in itself responsible for much of the complexity and confusion hitherto associated with sales tax.

The application of sales tax at a single point only would seem to derive from the conception that as the tax is leviable on commodities sold it is more convenient to collect it at one rather than at several points in the distribution chain. There is, however, another and perhaps more logical conception of sales tax which places the emphasis on the activity of selling goods rather than on the commodities sold and this latter conception forms the basis of the following proposed system which the Chambers strongly recommends.

The mode of collection of such a sales tax would be a levy on the aggregate turnover of every trader in the country without exception in respect of all goods sold by him in India again without exception. The essence of the suggested tax is that there be no exception and that the rate of tax be a small percentage (say one quarter of one per centum) of turnover common to all India. Such a tax would still be a tax on the sale of goods but would be one without the disadvantages previously indicated. Each trader would be taxed at a common rate on all his sales of goods, irrespective of the commodity or commodities in which he deals; he would not be permitted to pass on the tax as such down the chain of distribution to the buyer or consumer; tax would be allowable as a deduction for income-tax purposes and would be absorbed as an overhead expense of his business. No State would be permitted to impose any tax on the sale or purchase of goods additional to the tax payable under the proposed system. The scheme can succeed only if the rate of tax is kept low, so that the burden on the individual is not so heavy as to encourage evasion and so that the effect on prices would be indirect and negligible, in spite of the multi-point nature of the tax. The rate of tax must be kept low also so that goods to be retailed in small units at fixed prices may be related to the coinage. Thus, a maximum rate of tax should be prescribed by law, preferably in the Constitution. To avoid difficulty, the trader should be required to pay tax under the proposed system only to the State in which his place of business is situated; if the trader carries on business in more than one State, then he should be assessed by the State in which each place of business is situated on his aggregate turnover in respect only of that place of business. The advantages of the proposed system may be stated to be:—

- (a) as the consumer is not asked to pay any specific sum by way of sales tax and as the "sales tax" element in the price he pays is negligible and constant, there is no incentive to evade payment;
- (b) the retail dealer is relieved of the very considerable burden of registration as a dealer and of complying with the many formalities imposed under the present system and, as he is not asked to pay any specific sum by way of sales tax on his purchases from the wholesale dealer, again there is no incentive to evade payment or to divert his purchases through abnormal channels;
- (c) the wholesaler dealer is relieved also of the very considerable burden of registration, compliance with legislative formalities, probably in several States, and keeping documentary evidence relating to exempted transactions. He is able to supply his goods to the dealers of his choice, the incentive to evasion again being absent;
- (d) Industry and trade generally would be greatly relieved as regards records, correspondence, invoicing of sales and ordering of supplies. Manufacturers would no longer require to make declarations or otherwise satisfy suppliers as to their classification when ordering raw materials and capital goods. No problems would arise on inter-State transactions and there would be little room for doubt or dispute as to sales tax liability. Sales tax considerations would no longer hinder the normal geographical development of trade;
- (e) for the State Governments, the proposed system offers probably higher nett collections and lower administrative costs, the extent of the collections depending in practice on how wide the taxation net is cast.

Separate answers to Questions 125 to 134 are now given in the light of the foregoing general statement. Before doing so, the Chamber thinks that the attention of Government should be invited to a sales tax system which seems at this juncture worthy of study by those responsible for the architecture of the Indian revenue system. This is the Canadian general sales tax which was imposed in 1920 and is now the largest source of indirect tax revenue in that country. There are today no retail sales taxes in the Canadian tax system; the general sales tax applies to all sales of goods produced or manufactured in Canada or imported into Canada unless specifically exempt by law. All the principal manufacturers and producers of taxable goods in Canada and all the importers of taxable goods into Canada are required to be licensed, and the tax is payable by the licensed vendor, whether producer, manufacturer, or wholesaler, at the time of sale or delivery, and by the licensed importer at the time of entry for consumption. The licensing requirement not only gives the Excise control over the manufacturers and importers who constitute the actual collectors of the tax, but also performs another and valuable function, in that it permits the adoption of a system whereby manufacturers pass materials and semi-manufactured goods from one owner to

another without collection of the tax. This enables free movement of materials and goods still in process to take place without the complications involved in tax accounting. The actual collection of the tax involves the employment of a minimum staff; and the yield is substantial, being, at the present modest rate of tax—which is 10 per cent. *ad valorem*—more than 17 per cent. of the total national tax revenue.

Question 125.—Under the Constitution, the only sales or purchases which can be taxed are sales or purchases of goods. Do you consider that the sales tax should be extended to—

(i) services, so that the tax may be leviable on (a) charges for services proper (e.g., bills from a goldsmith or a printer), (b) charges for both services and goods where the two cannot be readily separated (e.g., hotel bills) and (c) charges for certain types of goods into the price of which service enters as a substantial element (e.g., paintings or photographs); and

(ii) transactions of sale or purchase in stock exchanges and futures markets?

If so, please deal with the administrative and other issues which may arise in the implementation of your suggestions.

The Chamber does not consider that sales tax should be extended to (i) services or (ii) transactions of sale or purchase in stock exchanges. Under the present system sales tax is payable purely on sales of goods. The same would be true under the proposed system. But to avoid difficulty in practice, it might be conceded that where there is a "service" element in the price of goods sold by traders in the market place, such as the product of the goldsmith, the photographer and the printer, then the trader should be required to pay sales tax on his aggregate turnover comprising both "sales" and "service". The point is one of some difficulty, as obviously the fees chargeable by doctors, lawyers and other professional men must be excluded, as should the charges made by an hotel-keeper, as there is no justification for a sales tax on the rent element in his charges.

The extension of "sales tax" to stock exchange transactions would result in a tax akin to a levy on capital; this must be avoided. No tax should be levied on transactions in "futures markets".

Question 126.—(i) The Union alone has the power to levy a tax on sale of newspapers or on advertisements in them. This power has not, so far, been exercised. Would you propose as desirable and feasible (a) a tax on sales only, or (b) a tax on advertisements only, or (c) a tax on both?

As regards (a), it has been urged that, on account of the small price charged for each newspaper, the sales tax would be fractional and cannot be passed on to the buyer, whereas in the aggregate it would be an undue burden on the concern itself. If you agree with this, how would you meet the difficulty?

As regards (b), what classes, if any, of newspapers or advertisements would you exempt from the tax, and what rates of tax, graded or other, would you levy?

(ii) Have you any suggestions to make regarding the taxation of advertisements other than those appearing in newspapers?

(i) (a) The Chamber is of the firm opinion that the taxation of sales of newspapers is undesirable on the grounds that such taxation is repugnant to the ideal of a free press.

A healthy press is of the greatest value to the country as a means of conveying accurate information and of airing views on the many issues which arise from time to time. At present, newspapers reach only a negligible percentage of the population of the country, circulation being confined to a small proportion of the literate population. In most advanced countries, the buying of a daily newspaper is an established habit but this is not so in India. Since it is essential that the Government should have the ear of the people it is obviously in the Government's interest to encourage the sale of newspapers at the lowest possible price. If a sales tax were applied not only would there be a drop in circulation but the spread of public information and literacy would receive a great set-back. It is, however, pointed out that a tax on the sale of newspapers is regarded under the Constitution as a tax distinct from a tax on the sale or purchase of goods and such sales would be exempted under the system advocated by the Chamber but, for administrative convenience, it would be necessary to provide that wholesale and retail dealers in books and newspapers must pay sales tax in common with all other traders.

(b) The Chamber is also opposed to the taxation of advertisements appearing in newspapers. Both the advertisers and the newspapers in which they advertise are already heavily taxed both directly and indirectly and to impose a tax on advertising in newspapers would

therefore hinder the development of sales publicity which is so little advanced in India and which should be encouraged as much as possible in order to promote the distributive functions of the economy, and to expand consumer markets for the country's growing industrial potential. As regards the effect such taxation would have on newspaper revenue, it is pointed out that the advertiser works on a fixed budget which can be increased only if his sales increase. Any taxation on advertisements would therefore be met from the advertiser's budget thereby automatically reducing the amount spent on actual advertising by the amount of the tax which is to be paid. Therefore, although Government would benefit by a certain amount of revenue, the newspaper would automatically suffer a loss of revenue and, therefore, the means to carry out the sales promotion necessary to increase circulation.

(c) In view of the Chamber's replies to parts (a) and (b), no further comment is necessary.

(ii) Opinion is divided regarding the taxation of advertisements other than those published in newspapers. If such advertisements are to be taxed, there appears to be justification for the exemption of the rent element in the case of hoardings and the like.

Question 127.—As regards sales tax generally and, in particular, the sales tax on goods leviable by the States, it is sometimes argued that—since all goods sold in a State must fall within one of three categories, viz., (a) manufactured or produced within the State, (b) transported into the State from elsewhere in the country and (c) imported into the State from abroad—an extension or increase of excise would serve just as well as sales tax for category (a), of octroi or terminal tax for category (b), and of customs for category (c). Do you agree with this view which implies that the sales tax has no specific function to perform in the country's system of taxation? If not, what in your opinion, from the point of view of a correlated tax-structure, is the legitimate place and scope of the sales tax as distinguished from that of excise, octroi and customs?

It is agreed that sales tax as hitherto levied in India is of the same nature as excise duty or customs duty and could be replaced by adjustment of these other taxes, subject to suitable arrangements being made by the centre for apportionment of the proceeds among the States. Each of these taxes is a levy on commodities and similarly sales tax if passed on by the seller to the buyer is a levy on the commodity sold.

Under the system proposed by the Chamber, however, sales tax cannot be passed on as such to the purchaser and represents only a fractional element in the consumer price. It ceases to be a commodity tax and thus acquires a legitimate place in the tax structure of the country, alongside customs and excise duties.

Question 128.—(a) Sales tax is almost invariably levied by the State Governments in terms of the turnover of the dealer over a given period. Since a sales tax leviable on the individual transaction necessitates fairly elaborate accounts, cash memos, etc., which only a small proportion of dealers is equipped to maintain, do you agree with the view that, in Indian conditions, the bulk of the sales tax is likely, for a long time to come, to continue to be leviable on aggregate turnover as distinguished from the individual sale-price?

(b) In most States there are separate laws governing sales tax on petrol. To what articles, if any, do you consider it desirable and feasible to extend the particular system adopted in respect of petrol?

(a) In the opinion of the Chamber sales tax should always be levied on aggregate turnover as a matter of administrative expediency, but when the levy is in the shape of a single or double-point tax and there are numerous exemptions the advantages of assessing aggregate turnover are largely lost. Both the connecting authority and the assessee have to consider the nature of each individual transaction and dealers right down to the retailer have to maintain elaborate accounts for the sole purpose of accounting for sales tax. Only a multi-point tax with few, if any, exemptions can provide the administrative advantages to be expected from assessing aggregate turnover.

(b) The distinctive feature of the majority of the State laws governing sales tax on petrol appears to be that the tax is assessed as a single-point tax on retail sales but there is no uniformity, even in this limited sphere, in character or incidence. To have separate laws governing sales tax in relation to different commodities would merely be to add a further complication to an already confused picture.

Question 129.—(1) In regard to a system of levy based on turnover, is the choice broadly limited to the alternatives hereafter mentioned or is there any other system you would advocate? Under the system you

recommend would sales tax continue to be roughly as significant a source of State revenue as at present? The alternatives referred to above are :

- (i) a relatively low rate of levy at each of almost all points of sale; few dealers excluded and few goods exempted (Multi Point);
 - (ii) a relatively high rate of levy at only one point, viz., the point at which a registered dealer sells either to a consumer or to an unregistered dealer; exemption from tax of sales by one registered dealer to another registered dealer; excluding from compulsory registration of a dealer below a certain limit of turnover; a large number of exempted goods (Single Point);
 - (iii) various combinations of the above.
- (2) Which of the above alternatives would you advocate? Please state your reasons in some detail, comparing merits and demerits from the point of view of (a) the consumer, (b) the dealer, (c) industry, trade etc., generally and (d) Government. Please relate your arguments, as far as possible, to lessons which may be drawn from the actual working of Sales Tax Acts in different States.

(3) In particular :

- (i) as regards (a) above, do you think that the sales tax, or any particular form of it, leads to a greater burden being placed on the consumer than is accounted for by the proceeds which accrue to the Exchequer?
- (ii) as regards (b) above, have you any suggestions to make regarding the simplification of forms, accounts etc., and of the procedure generally in order to make the administration of the tax less burdensome to the dealer? Further, having regard to the cost of maintenance of the machinery for compliance, would you suggest an alternative form of taxation so far as small dealers are concerned?
- (iii) as regards (c) above, has the imposition of the sales tax led to any noticeable change in the organisation of the trade in the country, especially in regard to the size of the business unit, location of head-offices, number of intermediaries, variety of the goods dealt with etc.?
- (iv) as regards (d) above, please examine the financial and administrative aspects, including the scope for evasion presented by the particular system and the difficulty or otherwise of counteracting it.

It is agreed that the choice is limited broadly to the alternatives listed. It will be seen that the system proposed by the Chamber comprises a low rate of levy at all points of sale with no dealers and no goods exempted, being thus a multi-point sales tax system. It is believed that sales tax would continue to be roughly as significant a source of State revenue under the proposed system as under the present system; in fact, if the tax net is widely cast and a method is devised to collect small amounts by way of tax from small traders at low cost (for example, on payment of a licence fee), the proposed system may well be more significant as a source of revenue. No other system of multipoint taxation can be recommended. Simplification of forms would not in itself provide much relief so long as the single-point tax remains, this being the cause of the bulk of the paper work in sales tax accounting. In some States a multi-point tax at too high a rate has tended to put intermediaries out of business, and in the opinion of the Chamber sales tax, under the existing system, may well affect the size of the business unit, location of head offices or variety of goods dealt with, in the future.

Question 130.—In relation to the particular system you advocate :

- (i) should there be special rates of levy, higher than the ordinary rate, for certain articles? If so, for which types of articles?
- (ii) should there be special rates of levy, lower than the ordinary rate, for certain articles? If so, for which types of articles?
- (iii) which articles, if any, should be exempted altogether and why? Please elaborate the principles which, in your opinion, should underlie exemptions.

The essence of the system advocated by the Chamber is that the tax is payable by the seller on his selling operations (in relation to goods) and not on the commodities he sells. Its chief merit is simplicity without the accompaniment of inequalities. Therefore there should be no discrimination between one article and another; there should be only one rate applicable to all commodities and there should be no exempted commodities. The discriminating media in relation to the taxation of commodities should be confined to Customs and Excise duties. If discrimination in favour of essential commodities is desired this should be effected by means of subsidies.

Question 131.—In regard to system, rates, exemptions, etc., what degree of uniformity between the different States do you consider desirable and feasible? Would you bring it about—

- (i) by formal or informal convention;
- (ii) by central legislation promoted at the instance of two or more States;
- (iii) by constitutional amendment, so as to include certain basic matters connected with the sales tax in the Concurrent List?
- (iv) by constitutional amendment so as to include the item of sales tax, as a whole, in the Union List? In the last mentioned case how would you apportion the proceeds? Would this alternative be a practicable proposition from the point of view of the finances of the States?

As has been stressed, uniformity in character and incidence of State sales tax throughout India is regarded as essential. To bring this about, it is thought that constitutional amendment would be necessary, so as to include State sales tax in the Concurrent List. Under the present system, it might then suffice to rewrite Article 286 of the Constitution. Under the system proposed by the Chamber it might be necessary to go further and to include "taxes on the sale or purchase of goods other than newspapers" in the Union list, although it might still be feasible to regulate by formal or informal convention ancillary administrative matters. Much would depend on the ability of the Centre to "sell" the proposed scheme to the States, the co-operation of the latter being an essential factor.

Question 132.—To what extent has any desirable uniformity been achieved in regard to exemptions (in favour of "goods essential for the life of the community") under Clause (3) of Article 286 of the Constitution? What principles would you advocate for deciding the exemptions to be made under this provision of the Constitution? Do you consider that the scope of the provision contained in Clause (3) of Article 286 should be extended also to "essential articles" which had been subject to sales tax before the relevant central enactment came into force?

The list of goods declared essential for the life of the community under the Essential Goods (Declaration and Regulation of Tax on Sale or Purchase) Act, 1952, appears adequate as it stands. Under the present system, it is thought that the scope of the provision contained in Article 286(3) of the Constitution should be extended to include all goods in that list in all States, including goods which were subject to tax before the Central enactment. Under the system proposed by the Chamber, however, all sales of goods would be taxed and the Act would become redundant, as would Article 286 of the Constitution, except to the extent that it should continue to prohibit the imposition of a State tax on goods imported into or goods exported out of the territory of India. The incidence of sales tax on the prices of "essential" and other articles would be so insignificant that the problem of exemptions would disappear.

Question 133.—As regards "sales outside the State", "inter-state commerce", etc. please discuss the adequacy or otherwise of the relevant provisions of Article 286 and suggest remedies for any defects which, in your opinion, have been revealed in the actual working of these provisions.

(b) Please discuss in this connection the desirability and feasibility of the suggestion that purchases only (and not sales) should be taxed, so that the tax jurisdiction of each State might be confined to parties residing within the State. Alternatively, do you consider that purchases should be taxed in certain cases and sales in certain others; if so, how and on what considerations would you define the two categories? In either case, please describe your scheme in some detail and explain the advantages which you claim for it.

Reference has been made in the general statement above to the doubt as to whether States have the power to collect tax from non-resident dealers on inter-State transactions. Whichever way this point is decided, however, the position will still be unsatisfactory. Either States will be given the power to tax non-resident dealers, or certain inter-State transactions will escape taxation altogether. The former decision would result in increased harassment of an already harassed commercial community and the latter decision would entail discrimination in favour of goods imported from another State with consequent further diversion of trade or the imposition of parallel purchase taxes to add to the existing confusion. In the opinion of the Chamber there is no satisfactory remedy to the defects of Article 286.

(b) Fundamentally there is no difference between a sales tax and a purchase tax. A single-point purchase tax if collected from purchasers would remove the problem of States' jurisdiction but would be infinitely more difficult to collect than a single point sales tax as there

are many more purchasers than sellers. If the so-called "purchase tax" were collected through the sellers it would differ little from the existing sales tax and the problem of States' jurisdiction would remain. A single-point sales tax restricted to inter-State transactions combined with a single-point purchase tax restricted to inter-State transactions would be feasible but collection of the purchase tax would be difficult and probably uneconomic. In the opinion of the Chamber neither sales nor purchase tax can be administered efficiently and economically unless applied at a low rate on a multi-point basis with no exempted transactions.

Question 134.—Do you think that lack of uniformity between the States as regards the rates of sales tax and the methods of applying it (single or multiple point) has the effect of raising barriers in inter-State commerce or of including uneconomic diversions of trade? If so, what measures would you suggest to rectify the position?

The Chamber's attitude has already been stated. Lack of uniformity undoubtedly has had the effect of raising barriers in inter-State commerce and of inducing uneconomic diversions of trade. The first essential to rectify the position is complete uniformity in all States. The system advocated by the Chamber not only achieves this uniformity but also introduces all-round simplification.

STATE EXCISES.

Question 135.—(a) In regard to State excise duties and the revenue therefrom, have you any comments or suggestions to make—

(i) on features of importance connected with the system of levy of these duties in different States.

or

(ii) on policies involving various degrees of relinquishment in certain States of the revenue from these duties?

Should there, in this context, be uniformity between different States? If so, in what particulars and to what extent?

(b) Is there proper co-ordination between the levy of of Central excise on medicinal and toilet preparations containing alcohol, etc. and of State excise on alcoholic liquors? If not, what steps would you suggest to ensure adequate co-ordination?

The Chamber has no comments to offer on this question.

General.

Question 136.—Do you think there is a case for vesting in the administration the power to alter, by executive order, the rates of import duties, export duties and excise duties? If so, please indicate in what circumstances and within what limits such power should be exercised.

The Chamber is strongly opposed to the grant to the executive of discretionary power to alter rates of import, export and excise duties. It has already emphasised that these forms of taxation must be used with the greatest care and circumspection and should be imposed solely for revenue purposes. Provision for their variation by executive order would be highly dangerous and would not only encourage a distorted use for other purposes, as for instance for exercising a control over the course of trade, but would lead to frequent variations which would have most detrimental effects on commerce and industry. Furthermore, as a matter of principle, the Chamber considers that it is wrong that in a matter of such overriding importance to the economic life of the community a wide discretionary power should be vested in the executive.

Question 137.—Do you visualise any scope for extension of the field of commodity taxation as a result of the implementation of the Five Year Plan?

The Chamber has advocated elsewhere an increase in indirect taxation and, *ipso facto*, in the taxation of commodities. The scope for such taxation will obviously depend to a considerable degree on the working of the Five Year Plan, for the plan is directed towards an increase in both agricultural and industrial production and both in the public and private sectors; an increased output of commodities and manufactures, with a corresponding improvement in the general prosperity of the country, must obviously widen the sources available for commodity taxation.

Question 138.—What "luxury" articles, if any, would you suggest on which commodity taxes in any of the various forms might be levied at specially high rates?

Almost every type of "luxury" article is already subject to high rates of taxation and the Chamber is of the opinion that, the point of diminishing returns having been reached and in some cases surpassed, there is really little

scope left for an increase in the taxation of luxuries. Government themselves are in the best position to estimate the amount of revenue accruing from such taxation but the Chamber believes that, relative to the income from taxation as a whole, it cannot be great and that, in view of the fact that expenditure upon luxuries is one of the objects of securing a high income, the comparatively small revenue arising from the penal taxation of luxuries is more than counterbalanced by the disincentive to hard work and higher earnings which such taxation involves.

PART IV.—AGRICULTURAL INCOME-TAX.

Question 139.—A few States levy agricultural income-tax, but in almost none is it among the more important sources of revenue; the progress of land reforms will further reduce its yield. Would you, in order to increase the yield from this tax or for other reasons (which may please be specified), make major modifications in the present system of taxation of agricultural income? If so, please indicate the modifications you would make.

Question 140.—In particular, do your suggestions involve—

(a) correlation, and if so, to what extent, of agricultural with non-agricultural income-tax;

(b) alteration, and if so, in what manner, of the levy of land revenue?

As regards (a), if the correlation suggested takes the form of the levy of a single tax on the total of non-agricultural and agricultural income, instead of the present separate Central and State taxes, please deal with the constitutional, administrative and other problems involved, including the apportioning of proceeds among State Governments. Alternatively, if the State Governments continue separately to levy a tax on agricultural income, but the rates of levy are based on the total of the two types of income, agricultural and non-agricultural, what are the specific problems which arise, and how would you deal with them?

As regards (b), please indicate the probable net effect of the suggested measures on the revenues of Government. What administrative or other issues are involved, and how would you deal with them?

Answer to Question 139 and 140:

In the respect the Chamber has nothing material to add to its replies to questions 52 to 54 of the Commission's questionnaire.

There is however a tendency in some States to assess for the most part only large plantations and Zamindaris to agricultural income-tax, and to fail to assess the larger ryots who in view of the present prices of rice, jute, sugar, tobacco, etc. should fall within the ambit of the tax.

Question 141.—How would you determine taxable income in the comparative absence of accounts in rural areas? What treatment should in particular, be given to the following:

(i) expenses of cultivation, harvesting, preparation for the market etc.;

(ii) agricultural losses owing to a calamity or other reasons; (in this connection, would you favour giving the assessee the discretion to choose the alternative of averaging his income over a number of years—say 3 to 5 years—in order to cover good and bad years?)

(iii) depreciation in respect of—

(a) live stock,

(b) implements and carts,

(c) means of irrigation e.g., wells etc.,

(d) buildings?

Here also the Chamber has little experience and restricts itself to observing that the income to be assessed to agricultural income tax should be based on actuals both of income and expenditure of the assessee's accepted accounting period and not on hypothetical calculations and formulae such as the assessing officer's own ideas on the average acreage output of the district concerned and the prices realised for this output.

Subject to the above the Chamber's replies to the questions are as follows:—

(i) Expenses of cultivation, harvesting, preparation for the market etc. All these expenses should be allowed.

(ii) Agricultural losses, etc.

Results average this out and there is no need for special treatment for good or bad years provided that the carry-forward of losses is permitted.

Question 142.—*What rates would you prescribe for agricultural income tax and how would you graduate them? Is it possible to have uniform rates in all the States? What exemption limits would you lay down?*

The rates, which should be uniform for all States, should not exceed the ordinary income tax rate. The exemption limits should be the same as for ordinary income-tax.

LAND REVENUE AND LAND CESSES.

Question 143.—*For areas already under or likely hereafter to be brought under ryotwari or similar tenures, do you consider that land revenue policy should be based on some form of periodical settlement?*

If not, what alternative would you suggest? How would you work it? What would be its probable net effect on Government's revenues?

The Chamber favours the present policy of periodical settlements at which the land revenue payable by the ryot is revised. One alternative to this system would be to settle the revenue payable once and for all; that is, to fix it permanently. The Chamber considers that such an alternative would be open to the following objections:—

- Under a permanent settlement the revenue paid by the ryot would be fixed in perpetuity with the result that Government would not be entitled to an increase in land revenue consequent on an increase in the produce or its value. Similarly the cultivator would not be entitled to reduction owing to a decrease in the produce or its value.
- The demands on the revenues of the Governments in India have increased considerably in recent years and in all probability will continue to increase. The fixation in perpetuity of the land revenue paid by the ryots would deprive Government in the future of any increase in income from this source and would be unjust to the remaining body of taxpayers.
- It would be impolitic for a Government to bind its successors for all time, irrespective of changes in the value of money or of the land and its produce.
- A settlement in perpetuity would involve the risk of a charge of a breach of faith if it were necessary in the future to impose taxes on land.

Two other substitutes for the present system were examined by the Indian Taxation Enquiry Committee of 1924/25, namely, an export or produce tax and the imposition of a tax on capital value. The Chamber notes that neither of these substitute schemes was approved by the Committee.

Question 144.—*If you are in favour of periodical settlements, what modifications, if any, would you make in the practices and principles which have been followed hitherto, and why? In your reply, please refer in particular to the following—*

- Period of guarantee—*Should this be shorter than in the past? Would you suggest longer periods in special circumstances, e.g., when ryotwari tenure is introduced for the first time?*
- Scope of guarantee—*Should a fixed assessment be guaranteed for a specific piece of land (or for a proprietary body, as for instance, in the Punjab)? Alternatively, should a basic rate be fixed and limits guaranteed within which it may vary? What factors would you take into account in varying the rate, e.g., area, nature of crop, yield, prices, etc.?*
- Basis of assessment—*How should the basic rate be fixed? Would you introduce an element of progression?*
- Incentive to production—*Would it be feasible so to regulate assessment as to provide an incentive for—*
 - larger agricultural production;
 - shifts in production, e.g., from cash crops to food crops or vice versa;
 - capital improvements to land?
- Payment in kind—*Would it be possible to provide for payment in kind either partially or in full? Please discuss the advantages, difficulties, etc.*
- Uniformity between States—*In the application of these principles what degree of uniformity between different States would be desirable and possible?*

A full reply would involve a review of the principles and practices at present followed in all the temporary

settled areas. The Chamber feels that it has not the necessary knowledge and experience to undertake such a review, and proposes to limit its reply to two specific points—period of guarantee and payment in kind.

At the beginning of the present century the ordinary term of settlement was 30 years in Madras, Bombay, U.P. and Orissa; 20 years in the Punjab and C.P., and shorter periods in Assam and Sind. As explained in the Resolution issued by the Government of India in 1902, the 30 years' rule prevailed in areas where the land was fully cultivated, rents fair and agricultural production not liable to violent fluctuation. In areas where these conditions did not prevail, settlements were made for shorter periods. During more recent years the tendency has been to extend the periods, and in the Punjab and Uttar Pradesh the term in ordinary cases has been increased to 40 years. The point on which the Chamber wishes to comment is that of the extension of what may be called the maximum term beyond 30 years. It inclines to the view that a period of 30 years, which means that demands of Government are readjusted once in the lifetime of each generation, represents a fair balance between the interests of the land revenue payer and that of Government in its capacity as the representative of the general taxpayer, and doubts whether an extension of 5 or 10 years would be of material benefit to the land revenue payer. It is true that a longer term would be an advantage to the land revenue-payer in so far as it would protect him for a longer period against an increase in the revenue demand. On the other hand, however, it would be a disadvantage in so far as it would deprive him of a reduction in that payment at an earlier date should conditions have so changed as to warrant a downward revision of the land revenue. Again, the longer period might result in sharper enhancements in land revenue which, while they would be otherwise justifiable, would place an undue strain on the cultivator. Further it is most important for the cultivator that the revenue records, including the village map, should be periodically revised and brought thoroughly up-to-date, if the legal presumption of truth attaching to them in the Revenue Courts is to be maintained. For the smaller cultivator in particular there is a danger in extending the term of settlement unless some sure means can be devised for maintaining the accuracy of the village records throughout the period of settlement. The Chamber understands that the demand for an extension of the 30 year term was largely due to two factors. First the conviction among the land revenue payers that a resettlement invariably means an enhancement and secondly the harassment caused to the people by the survey and settlement operations. As regards the former it could be removed by Government making it perfectly clear that a resettlement would not necessarily involve an increase in the revenue demand and would not be postponed solely because it might result in a reduction. The second is largely a matter of the control of the subordinate staff and the up-to-date maintenance of the village records during the period of settlement. The Chamber is therefore in favour of a return to the old position of a maximum term of 30 years.

As regards the payment of land revenue in kind, the chamber considers that the administrative difficulties would render such a course impracticable. These difficulties may be summarised as follows:—

- A large temporary staff would be required at harvest time, for presumably the ordinary revenue establishment would be unable to cope with the work involved, e.g., the division of the crop, its transport to warehouses and its subsequent sale.
- The danger of dishonesty by the temporary staff and of collusion between that staff and the producer would be great and difficult to prevent.
- Large storage accommodation would be required and the risk of damage to the grain prior to its sale would be considerable.
- The sale of the collected produce would be a major undertaking which the Revenue staff would not be qualified to carry out.

Land tenures and past assessments differ so much in different States that it is not desirable to seek any great uniformity. It is, however, a sound thing for each State to ascertain the pitch of assessment in adjacent districts of the neighbouring State or States.

The Chamber has no comments to offer on questions 145 to 150.

Question 151.—*Are there any suggestions which you would make in regard to the assessment of—*

- Agricultural land in rural areas, used for non-agricultural purposes;
- land classed as agricultural but now part of an urban area and used for non-agricultural purposes; and

- (iii) land classed as non-agricultural, whether in rural areas or in urban areas, and used for non-agricultural purposes?

The Chamber suggests that:—

- Land used as sites for hospitals, dispensaries, schools and the like, which yield no return to the owners, should be exempted from assessment to land revenue so long as they are utilised for such purposes.
- Village sites which have hitherto been revenue free should continue to be so.
- Subject to the above exceptions land used for non-agricultural purposes, whether within or outside an urban area, should be assessed at a percentage of its market value. The assessment should be subject to review periodically.

The Chamber has no comments to offer on questions 152 to 154.

IRRIGATION RATES & BETTERMENT LEVY.

The Chamber has no comments to offer on questions 155 to 161.

PART V.—OTHER TAXES (Central and State).

STAMP DUTIES AND COURT FEES.

Question 162.—Under the Constitution—

- the Union is empowered to fix the rates of stamp duties in respect of bills of exchange, cheques, promissory notes, bills of lading, letters of credit, policies of insurance, transfer of shares, debentures, proxies and receipts, and
- the States are empowered to fix the rates of all other stamp duties.

As regards both (1) and (2), have you any suggestions to make for the levy of a stamp duty where it is not already levied, or for an increase or decrease of the present rates where a stamp duty already exists? Please give reasons for your suggestions. Are there any general principles which you would propose for adoption in regard to the fixation of rates of stamp duties?

As regards (2), since the rates vary from State to State, what degree of uniformity do you consider desirable and feasible, and how do you propose to achieve it?

If possible, please estimate the net effect of your proposals on the revenue of States.

(1) The Chamber's views on the rates of stamp duty on the various documents referred to are as follows:—

(a) *Bills of Exchange, Promissory Notes, Letters of Credit.*—It is not considered that any alteration in the present rates on these documents should be made. It is considered that these duties are adequate, have stood the test of time, and in addition, their collection is a simple matter and involves little expenditure.

(b) *Cheques.*—The stamp duty on cheques at the rate of one anna per cheque was abolished as from the 1st July 1927. The object of this action was to stimulate the development of the banking habit in India, and it is considered that such encouragement is still desirable and has even greater force owing to the urgent necessity to canalise funds in the hands of the public into the banking system where they are fully utilised for the finance of industry and commerce. The Chamber understands that it has been authoritatively estimated that a stamp duty on cheques at the former rates would, after excluding the costs of collection, yield a very small return and would in any case be attended by considerable practical inconvenience. The Chamber is, therefore, strongly of the opinion that a reversion to the system of Stamp duty on cheques is very undesirable.

(c) *Bills of Lading.*—Although the Indian Stamp Act provides that the stamp duty on bills of lading shall be a minimum of four annas and, although the rate was fixed by the Central Government, the actual rates of duty at the major Indian ports are as follows:—

Calcutta	8 annas
Bombay	4 "
Cochin	6 "
Tuticorin	6 "
Madras	6 "
Vizagapatam	6 "

The Chamber is strongly of the opinion that it is desirable that the rate throughout India should be uniform, and suggests that it should be fixed at 6 annas.

(d) *Stamp Duty on Policies of Insurance.*—There are two points in particular which the Chamber wishes to put forward. These are:—

(1) *SEA INSURANCE* (VIDE CHAPTER 2, SEC. 7 AND ITEM 47-A OF SCHEDULE I). Nowhere is the term Sea Insurance properly defined and there have been various rulings by various Collectors in different parts of the country, including one from a Collector in Calcutta, which stated

that where a policy covered any land risk even though that risk was purely incidental to a sea voyage, stamp duty as per (a) would not be applicable and such a Policy would require to be stamped as per (b). The present position is very anomalous and it is felt that it could be clarified quite simply by referring to Marine Insurance or Marine Insurance Policies instead of to Sea Insurance or to Sea Insurance Policies. The definition of Marine Insurance could then be taken from that appearing in the Insurance Act.

It is not thought that this alteration would materially alter the amount of stamp duty collectable but it would undoubtedly help to remove present anomalies.

(2) *ACCIDENT AND SICKNESS INSURANCE* (VIDE ITEM 47-C OF SCHEDULE I).

There are really two points here, viz.:—

- The stamp duty on Personal Accident Policies proper, and
- That on Personal Accident Aviation Coupons covering merely individual flights, the stamp duty on which is at present covered by notification No. 5 issued by the Government of India on 12th March, 1938, which reads:—

"In exercise of the powers conferred by Clause (a) of Section 9 of the Indian Stamp Act, 1899 (II of 1899), the Central Government is pleased to remit so much of any of the duty chargeable in British India under clause (b) of article 47-C of Schedule I to the said Act on policies of insurance covering accidents to passengers travelling by air as exceeds one anna in each rupee of the amount of premium payable on the policy."

As regards (i) it is felt that the duty is altogether too high as an initial charge, whereas the payment of further stamp duty at renewal seems warranted. There seems no particular reason why this class of insurance should be singled out for special treatment and it is suggested that Section C should be confined purely to Travel Coupons and that the stamp duty on ordinary P. A. Policies should be the same as that for any other class of insurance as laid down under Section 47-B, Schedule I.

As regards (ii) having regard to the low rates which are charged for these Coupons the rate of stamp duty seems to be exorbitant and it is suggested that the rate of stamp duty in these cases should be the same as that for cover on a single railway journey, as laid down in sub-paragraph (a) of Section 47-C of Schedule I.

(e) *Stamp Duties on Transfers of Shares, Debentures, Proxies and Receipts.*—At present the rate of stamp duties on the transfers of shares, debentures, etc. is 12 annas per cent. and, in the opinion of the Chamber, there is little doubt that this rate leads to losses to the Government revenue because of the encouragement which it gives to the holding of shares under blank transfers. It is therefore considered that in this case the Government revenues might benefit from a reduction in the rates which would encourage more frequent registrations.

(f) *Stamps on Proxies and Receipts.*—The Chamber considers no change is required.

(2) As a matter of principle, the Chamber considers that the rates of stamp duties in respect of documents, other than those on which the Union is empowered to fix the tax, should as far as possible be uniform throughout the country, though it is realised that this may be difficult of achievement.

Question 163.—Certain States (e.g., Bombay) levy stamp duties on transactions in forward markets. What is your view regarding the complaint that these duties have tended to affect the business in these markets, particularly that of the middle class traders? If you consider that the levy of stamp duty on transactions in these markets is a suitable and potentially important means of securing revenue, what administrative and other measures would you suggest for the efficient collection of such duties? Alternatively, in place of stamp duties, would you suggest some other form of taxation of transactions in stock exchanges and futures markets? If so, please elaborate your suggestion.

The Chamber is opposed to the levy of stamp duties on transactions in forward markets, stock exchanges, etc. In properly regulated markets, transactions in these exchanges should play a valuable part in the organisation of commodity sales and in mobilising credit, etc., and it is considered that from this point of view a tax on these activities is undesirable.

Question 164.—In this country, the stamp duty is ordinarily a tax on documents which constitute evidence of legal rights. There are, however, certain taxes, such as the entertainments tax, which are sometimes collected in the form of stamps, and suggestions have been made that this system may be appropriately extended to the collection of taxes on the sale of

goods or on other transactions. Do you agree with this view? If so, to what taxes would you extend the scheme?

The Chamber is of the opinion that the extension of the system of stamp duty to the sale of goods, etc., is inappropriate.

Question 165.—What are the more common methods of evasion or avoidance of payment of stamp duty? What means of prevention would you suggest?

Although the Chamber understands that evasion of stamp duties is probably not widespread, it may arise by the declaration of a lower consideration than that actually agreed. Under English law it is understood that the revenue authorities are empowered to ignore the consideration set out in the document and to charge the amount of duty on the real value as ascertained by the revenue authorities. Similar provisions could be introduced in this country, but safeguards would be required against—

- (i) arbitrary assessment by the revenue authorities; and
- (ii) the treating of ordinary commercial transactions in the same manner as inter-family trusts, transfers, etc.

Question 166.—The rates of court fees differ from State to State. To what extent do you consider uniformity in the rates desirable and feasible?

The Chamber is of the opinion that uniformity as between State and State is desirable, but holds no strong views as it appreciates the practical difficulties which may arise.

Question 167.—Have you any suggestions to make regarding the schedules to the Indian Court Fees Act and the rates of levy thereunder?

The Chamber considers that the rates charged in Bengal are reasonable, and that efforts should be made to reduce those charged in other States to that level.

Taxes on Motor and other Vehicles.

The Chamber has no comments to offer on questions 168 to 171

Entertainments tax.

The Chamber has no comments to offer on these questions 172 to 175.

Tax on the Consumption or Sale of Electricity.

Question 176.—A tax on the consumption or sale of electricity is levied in several States in India. Do you consider that this is a suitable tax and may be adopted by other States? Would you restrict it to consumers of energy for domestic purposes or would you extend it to sales for industrial uses also?

A tax on the consumption or sales of electricity is not considered a suitable tax and should not be extended to States which do not now impose it. Electricity is a necessity in a modern city and can no longer be classed as a luxury; its use should be encouraged in preference to other fuels as it is clean and silent and its extensive use for light and fans beneficial to health. Approximately 96 per cent. of the electricity consumed is generated either by hydro-electric plants or steam plants using Indian coal. Any tax on electricity, by increasing the cost of current, will discourage its use and result in greater use of imported fuels such as diesel oil, petrol and kerosene.

If a tax is levied on electricity it should be restricted to users of energy for domestic purposes. To impose the tax on current used for industrial purposes would retard industrial development and would increase the costs of production thus placing a severe burden on industry. Industrial users might find that a tax increased their power costs to a point where it would be more economical to install diesel engines using imported fuel. Industrial modernization and expansion depends largely on cheap and plentiful supplies of electricity. Cheap electricity is particularly necessary for the development of cottage industries.

Question 177.—In respect of domestic purposes—

- (a) should a distinction be drawn between the electrical energy consumed for lights and fans and the energy consumed for other domestic purposes (frigidaires, heaters, radios, etc.)? On what principles would you determine the rates of duty?
- (b) what exemptions would you suggest and on what basis? Would you apply a lower rate of duty to small consumers?
- (a) No distinction should be drawn between electrical energy consumed for lights and fans and for other purposes. To install separate meters for measuring con-

sumption by lights and fans where, owing to the operation of an "all-in" rate, these would not normally be installed would mean that the electric supply undertakings would have to lock up large amounts of capital in meters required solely for the assessment of duty (the cost of an electric meter is approximately Rs. 44 for a single phase A. C. meter and Rs. 95 for a D. C. meter). Any duty on electricity used for domestic purposes should be restricted within reasonable limits such as the normal Sales Tax rate.

(b) The Chamber is of the opinion that there should be no exemptions. All consumers should be treated alike.

Question 178.—If you are in favour of a duty on energy used for industrial purposes, on what principles would you determine the rates of duty? What exemptions would you provide for and on what basis?

The Chamber is of the opinion that electricity used for industrial purposes should not be taxed, and therefore makes no comments on this question.

Question 179.—How would you modify your suggestions in reply to the foregoing questions if electrical energy—

- (i) is entirely supplied by Government undertakings in a State,
- (ii) is supplied by Government undertakings in some areas of a State and private undertakings in other areas?

If electrical energy is supplied by Government undertakings in a State entirely or in some areas it should be subject to the same taxation as that supplied by private undertakings.

Question 180.—What degree of uniformity as between different States would be desirable in regard to the levy of electricity duty? How would you achieve it?

There should be uniformity in regard to the levy of electricity duty between States. At present the only State which taxes all classes of supply is Uttar Pradesh where the rate is 25 per cent. of the gross bill; this has resulted in economic distress, especially in the small type of post-war industries, and industry is unfairly handicapped compared with industry in other States.

The Chamber has no suggestions on how uniformity should be achieved.

Betting and Prize Competition Taxes.

The Chamber has no comments to offer on these questions 181 to 183.

Miscellaneous Taxes and Fees.

Question 184.—Have you any comments or suggestions regarding any other taxes, cesses or fees, e.g., excise on opium, probate and succession duties, registration fees) not covered by parts II to V of the questionnaire?

The Chamber has no comments to offer on this question.

PART VI.—AGRICULTURAL INCOME-TAX, LAND REVENUE AND IRRIGATION RATES.

The Chamber has no views to offer on questions 185 to 208.

Question 209.—Please state your views on the relative merits of octroi and terminal tax, in one or more of the forms in which they prevail in different parts of the country, from the stand-point of—

- (i) the local body concerned: e.g., revenue derived and, in comparison with it, cost of collection, size, and complexity of administration, scope for evasion, etc.;
- (ii) the person who pays the tax: certainty as to amount payable and convenience of collection; and
- (iii) the trade, the consumer, etc.; incidence and effects of incidence, in so far as these can be broadly assessed.

Are octroi and terminal tax mutually exclusive systems, or would it be permissible and desirable, in certain circumstances, to combine the two systems?

On an examination of the relative merits of (a) Octroi (b) terminal tax and (c) any desirable form of combination of the two, which particular alternative would you recommend for general adoption by local bodies? Do any constitutional or legal difficulties stand in the way of implementing your suggestions?

Question 210.—Does your examination lead to the conclusion that both octroi and terminal taxes are unsuitable as forms of local taxation and should, therefore be abolished? If so, what substitutes would you recommend? Do you consider the suggestion that local bodies should be allowed to levy surcharges on sales tax feasible and desirable?

Answers to Questions 209 to 210 :

The Chamber considers that octroi and terminal taxes are unsuitable as forms of local taxation. It is pointed out that the effects of such local imposts on trade and the movement of commodities may be serious and that, from the point of view of local finance, the smallness of the yield and the likelihood that taxes of this nature lead to corruption and evasion make them unsuitable.

The Chamber has no comments to offer on questions 211 to 219.

Question 220.—*The Local Finance Enquiry Committee recommends that the limit of Rs. 250 placed on profession tax by the Constitution should be raised to Rs. 1,000. Do you agree? Would you recommend the wider adoption of profession tax by local bodies and/or State Governments? Which categories of local bodies may suitably levy it, and with what safeguards? Should the levy be compulsory in certain cases, and if so at what minimum level? What modifications, if any, would you suggest in the prevailing forms of levy of this tax? What steps would you take for its better correlation with income-tax, from the point of view of incidence or for purposes of administration, etc.?*

The Chamber sees no justification for a discriminatory personal tax of the nature of a profession tax and suggests that such taxes should be abandoned not only because they are objectionable in principle but also because the yield from them must be very small.

The Chamber has no comments to offer on questions 221 to 228.

Supplementary memorandum presented by the Bengal Chamber of Commerce and Industry.

When representatives of the Chamber appeared before the Taxation Enquiry Commission in Calcutta on the 8th March, they were asked to submit a supplementary note of their views on the following aspects of the Commission's questionnaire:

PART II.

A.—DIRECT TAXES.

(1) Question 58—Section 15C concessions to new industrial undertakings.

(2) Question 61—Replacement of existing assets.

B.—SALES TAX.

The Chamber's views on these points are set out below together with several further comments which the Chamber now wishes to present to the Commission in amplification of the Chamber's written evidence of the 19th September 1953.

PART II.

A.—DIRECT TAXES.

Question 58.—*Section 15C concessions to new industrial undertakings.*

What the Chamber originally sought to point out was that, admirable as the intention might be, the existing Section 15C concessions do not, in practice, afford much benefit to new industrial undertakings for the reason that the profits of new enterprises during their first five years are ordinarily small and after deducting initial and double depreciation allowances which fall to be deducted before profits eligible for consideration under Section 15C are determined, the profits remaining, if any profits do remain, are likely to be negligible. New industrial undertakings normally incur heavy capital expenditure before they can commence business, and the allowances given in respect of initial and additional depreciation are consequently substantial so that, even if considerable profits are earned by the new undertaking, the profits which rank for relief under Section 15C are still small.

Initial and double depreciation allowances, while giving substantial immediate relief to assesses, merely postpone and do not reduce the ultimate liability to tax, and consequently for any real benefit to be obtained under Section 15C, it is important that the allowance under this Section should be given with reference to profits computed before deduction of initial and double depreciation allowances, and if the full benefit of the concessions is to be made available, it is essential that any part of the Section 15C allowance which cannot be set off against profits should be carried forward in the same manner as losses are carried forward under Section 24.

The Chamber's recommendations to the Commission are now therefore that the percentage of capital employed prescribed by Section 15C, calculated separately for each of the five years for which relief is available, should be set off against profits computed before deduction of initial and double depreciation allowances and that if the profits are less than the percentage allowable, the portion which cannot be allowed should be carried forward (as losses are) from end of the five year period.

Question 61.—*Replacement of existing assets.*

As the Chamber understood it, and as the verbatim report bears out, the point made by the Commission

when the Chamber gave oral evidence was that as any tax concessions enabling industry to replace its assets came out of the pockets of the taxpayer, it was reasonable that the assistance so given should be confined to such industries as made, or were likely to make, a positive contribution to the building up of India's economy. The basis of any scheme, the Commission tentatively thought, should therefore be the selection of individual types of industry which are of real long-term value to the country, not of a non-essential or luxury nature; and the suggestion was thrown out that a non-official, disinterested body might be set up to determine which industries should be eligible for the concessions and to what extent. The Chamber undertook to think matter over and to see whether any concrete proposals could be made to the Commission.

After protracted consideration the Chamber has formed the opinion that the selective basis is both unworkable and unnecessary. First, while the staple export industries would obviously qualify for any concessions as essential to the country's economy, not all of their production is necessarily exported and from time to time the quantity diverted to the internal market would vary. It would therefore be difficult, if not impossible, in the context of the replacement of plant and machinery to determine to what extent any tax concessions should be allowed on such an industry. Secondly, many industries produce a variety of products, some of which might be considered essential to the economy, but again in assessing the extent to which concessions should be allowed the same practical difficulties would arise. Moreover, any selection of industries would be bound to operate harshly against what might be termed borderline cases and the Chamber does not consider that the most careful assessment made by any Committee set up for the purpose would be able satisfactorily to overcome these difficulties.

It is appreciated, however, that these concessions cannot be given at large to all industries without impairing the revenue sources of the country and it is suggested, therefore, that where it was decided that an industry was not essential to the economy, the concession granted could be recovered by means of excises and in the case quoted above of industries which are partly essential, excises could be levied on the products which were considered to be non-essential. Such a procedure, it is felt, would recompense the Treasury for the loss of revenue attributable to the tax abatement and would be consistent with the Chamber's own view that direct taxation has exceeded its limits and that the concentration should now be on the wider spread of indirect taxation.

In considering the form in which these tax concessions should be made, the Chamber would draw attention to the recent U. K. Finance Bill which provides for an investment allowance to replace the initial depreciation allowance. Broadly speaking this investment allowance is granted to the extent of one-tenth of the expenditure on the construction of buildings or structures for industrial purposes and to the extent of one-fifth of the expenditure in the case of new machinery or plant. This allowance is treated as a charge against the profits of the year in which the expenditure is incurred and is not taken into account when computing the written-down value of the asset nor in ascertaining the maximum amount on which a balancing charge may be made. The fact that this means of granting a concession has been devised to replace an initial depreciation allowance would indicate that in the United Kingdom substantial initial and other depreciation allowances have not produced the desired results.

Should the selective basis be favoured by the Commission, it is—the Chamber agrees—very necessary that a body entirely independent of and divorced from the executive should be set up to make the selection and—if that is the intention—to determine the degree of assistance to be given to the eligible industries in the replacement of their plant and machinery. This independent body, the Chamber urges, should not be advisory but should be authorised to make final decisions. It should take the same form, the Chamber considers, as the Board of Referees set up under the Excess Profits Tax Act, 1940, and should comprise as may benches as experience shows to be necessary to deal with the claims of those industries whose eligibility for the tax concessions is debatable or marginal.

Had time permitted at the hearing of the Chamber's representatives on the 8th March, it had been their intention to amplify the Chamber's written evidence on the following points:—

Question 48.—*Taxable receipts or gains.*

An assessment on a non-resident shipping company is understood to have been made recently on the basis that such companies are, in addition to being chargeable on profits attributable to freight and passage money originating in India also chargeable under Section 4(1)(a) on profits attributable to freight, etc., originating outside India if payment in respect thereof

is made in India. This represents a departure from the previously internationally accepted practice of long standing, whereby tax has been charged on the profits of such companies in the proportion that the outward freight and passage money only bears to the total freight and passage money.

The Chamber wishes to draw the Commission's particular attention to the hardship and repercussions of this procedure if pursued. Under the existing unilateral relief arrangements in operation in the United Kingdom, relief is limited to income actually arising outside the United Kingdom so that payment of taxes in India on income received in India but arising elsewhere means that relief cannot be obtained in respect of such taxes. The Chamber feels that it has not been sufficiently appreciated that the basis of assessment of non-resident shipping companies heretofore adopted is conventional in that the income of such companies, assessed in India, has been a notional figure determined on the principle that income arises where the freight originates. The Government of the United Kingdom themselves, in common with most other countries, assess on this basis and it is on this basis that they allow unilateral relief in respect of the profits assessed in India, and they are not prepared to allow unilateral relief on profits assessed in India which arise from freight originating outside India but paid in India.

The principle that income arises where freight, etc., originates, although accepted by usage, has never been definitely established and would, in fact, appear to be challenged by the decision of the Supreme Court in the case of the Anglo French Textile Mills v. Commissioner of Income-tax, Madras (Vol. XXIII I. T. R. 1953, p. 101). If, therefore, Government consider that foreign shipping companies should be assessed on the basis of profits received in as well as profits arising in India, then full and complete examination of the question of where the profits actually arise would be necessary, and it appears to be quite illogical that profits arising should, in such circumstances, be assessed on a notional basis which has, heretofore, been adopted for computing the total assessable profits.

The difficulty herein referred to would, of course, be overcome if a Tax Treaty were negotiated on the lines set out in the Chamber's answer to Question 72. In the event, however, of its not being possible to conclude such a Treaty, the Chamber urges most strongly that the conventional method of assessment followed until recently, which appears to be a fair and logical method of dealing with the taxation of shipping profits, should be continued.

Question 63.—Tax concessions to encourage the development of mineral resources.

Since the Chamber's written evidence was presented to the Commission last September, further memoranda by different branches of the mining industries have been submitted in support of the contention that encouragement must be given to the development of the country's mineral resources by means of depletion allowances not limited to 100 per cent. of the original costs and by the treatment as revenue of certain expenditure hitherto treated as capital expenditure in the case of companies working wasting assets.

The necessity and justification for such treatment has already been recognised in the agreement entered into between the Standard Vacuum Oil Company and the Government of India, reported in "Capital" of 11th February, 1954, to be as follows:—

"For a period of five years, Standard Vacuum is allowed a special deductible allowance equal to 33½ per cent. of the net income derived from its share of production before the assessment of income tax. This deductible allowance will be fixed anew for each period of five years on the basis of the relationship between total costs of operation and the total value of production."

These arrangements reinforce the view already expressed by the Chamber that the special position of mineral prospecting and development demands percentage cost depletion allowances not limited to 100 per cent. and that consideration should be given to the extent to which such allowances should be extended to other industries involving wasting assets where the prospecting or development is of a costly and uncertain nature. These factors, namely the cost and the uncertainty, vary in degree between one type of mineral extraction and another e.g., oil, gold, copper and coal; but the principle is the same in each such case and the extent of the justifiable tax concession, which should not be limited to 100 per cent., is merely relative to the differing costs and uncertainties of working the wasting assets.

This principle is well-established in countries which have endeavoured and are endeavouring to develop their mineral resources, for instance in the U. S. A. and Canada; the notable point being that in these countries

the depletion allowances continue so long as the mine or well is being worked and, unlike depreciation allowances, do not cease when the assessee has recovered the full amount of capital invested in the assets. In the relative tax law provisions of both these countries there are, of course, various refinements, qualifications and limitations and special provisions for old and new mines; but for the purposes of this memorandum the salient provisions illustrating the theory underlying the provision for depletion are sufficiently brought out by the following particulars which have been obtained by the Chamber regarding the depletion allowances given to producers (there being others applicable to persons other than producers and to shareholders):—

CANADA

Oil and gas wells.

To operators of producing oil or gas wells—33½ per cent. of the aggregate net profits (minus losses) from production of oil or gas from all wells.

Base and precious metals.

To operators of base or precious metals—33½ per cent. of the aggregate net profits (minus losses) from the production of all mines, or

To operators of mines whose production is to the extent of 70 per cent. or more from gold—the greater of 40 per cent. of the aggregate net profits (minus losses) or \$4 per ounce of gold produced.

Industrial mineral mines.

To operators of industrial mineral mines where the mineral is contained in non-bedded deposits—33½ per cent. of the aggregate of the net profits (minus losses).

Coal mines.

To operators of coal mines—10 cents per ton of coal mined.

Under a more recent provision of the law, Canada has allowed a three-year tax exemption for all new mines.

UNITED STATES

(1) There is a special section—Section 23(m)—of the U. S. A. Internal Revenue Code, which admits for mines, oil and gas wells and other natural deposits "a reasonable allowance for depletion and for depreciation of improvements, according to the peculiar conditions in each case; such reasonable allowance to be prescribed by the Commissioner, with the approval of the Secretary". The allowances prescribed under section 114(b) are:—

Oil and gas wells.—27½ per cent. of the gross income from the property during the taxable year, excluding from such gross income an amount equal to any rents or royalties paid or incurred by the taxpayer in respect of the property subject to a maximum of 50 per cent. of the net income (computed without allowance for depletion).

(2) **Coal mines.**—10 per cent. calculated as for (1).

(3) **Metal mines.**—15 per cent. calculated as for (1) and (2).

These depletion allowances, it should be explained, are additional to the ordinary provisions of the law relating to depreciation of assets.

The Chamber cannot too strongly urge that, if India's mineral resources of whatever type are to be satisfactorily developed in the face of competition from other countries, some similar structure of special depletion allowances, additional to depreciation, is essential.

Question 65.—Admissible expenses—Professional men and other self-employed persons.

The Bengal Chamber wishes to add its full support to the following comment made by the Associated Chambers of Commerce of India in the context of Item 65 of the Commission's questionnaire:—

"Attention has already been given in the replies to Questions 17 and 60 to the difficulties experienced by professional men and other self-employed persons in making adequate arrangements to provide for retirement. One method of meeting this serious difficulty would be to allow pensions or contributions to recognised superannuation funds to members or former members of firms. The present inequitable and invidious distinction which exists between directors and other employees of companies, and professional men and other self-employed persons and which only arises because it is impossible for such persons to obtain the protection of limited liability, requires removal by the acceptance of the

principle that suitable provision for the future should be permissible by the allowance, in their case as well as in others, of pensions or provident fund schemes as a working expense. Such action, the need for which is becoming increasingly recognised in other parts of the world, is essential if these vital professional classes are to survive or at the least to continue to attract men of talent and capacity."

Since the Associated Chambers offered these recommendations, the report of the Tucker Committee has been published in the United Kingdom and the recommendation contained in the report is that in such cases annuities up to particular sums will be allowed for tax purposes.

Question 82.—Assessment of Life Assurance Companies.

Instructions have recently been issued for the deduction from interest on Government securities owned by non-resident Insurance Companies not only of income tax, but also super tax. In the case of Life Assurance Companies this means that a deduction of super tax will be made at the rate of 0-4-9 in the rupee as compared with the correct rate of 0-2-9 in the case of a company which is a public limited company or 0-3-3 in the case of other Life Assurance Companies.

These companies are therefore suffering deduction of super tax at nearly double the correct rate on very large sums invested in Government securities, and their life funds are to that extent locked up and not earning interest.

It appears inequitable that tax should be deducted at source at a rate higher than that of the ultimate liability and the chamber suggests that steps should be taken in future to ensure that this is not done.

B.—SALES TAX

1. The proposals contained in the Taxation Enquiry Commission's note on Sales Tax, dated 7th April, 1954 are in outline only and it has been necessary to make certain assumptions in order to visualise the proposed scheme as a whole. The Chamber's interpretation of these proposals is shown on the attached chart (Appendix I).

2. It is noted that whereas the exporting State is entitled to a share of the Sales tax on inter-State dealings in certain raw materials and consumer goods (categories 2 and 3), in the case of luxury goods (category 4) the exporting State does not participate at all in the tax except on sales direct to consumers. Again, the proposed rates of tax are described as ceilings in the first three categories, whereas the rate is apparently fixed in the case of luxury goods. These inconsistencies are not understood, but are only mentioned in passing as they do not affect the conclusions reached by the Chamber.

3. The proposed scheme would be unconstitutional in that *inter alia*, it would restrict the States rights under the Constitution and it would permit of the imposition of tax on sales which take place outside the State. It is considered, therefore, that amendment of the Constitution would be necessary.

4. To be of any assistance this scheme would have to be applied not to a limited selection only but all commodities. Although the commodities enumerated may account in value for the bulk of the internal trade, they exclude many more commodities in which inter-State dealings are very numerous. Assuming the scheme could be put into force without amending the Constitution, the existing problems would remain for all commodities not enumerated and the position would become more chaotic than ever for dealers whose business was not confined to the enumerated commodities. If amendment of the Constitution is undertaken, it is open to doubt whether it would be possible to provide constitutionally for only certain commodities to be singled out for special treatment.

5. It is not considered practicable to work on ceiling rates. States might not necessarily apply the maximum rates and, for example, if exporting State A applied a rate of one pie and exporting State B a rate of three pies and a State importing from the two other States wished to levy the maximum possible tax, the importing State would have to legislate for rates of 11 pies on imports from State A and 9 pies on imports from State B. Such possibilities could result in extremely complicated rate structures in some States. Furthermore, the existence of differing rates in the various States would perpetuate the incentive towards diversion of trade from normal channels. Therefore the rates of tax should not be left as optional ceilings but should be fixed and compulsory.

6. Since States would be relying for part of their revenue on registered dealers and/or consumers in other States they would be vitally interested in the regulations concerning the registration of dealers in all other States. It would seem that to make such a scheme acceptable to the States the regulations regarding the registration of dealers, particularly with regard to the quantum of turnover, would have to be made identical throughout the country.

7. Since exporting States would be concerned with taxing dealers registered in other States, the selling dealer in the taxing State would be required by the taxing State to obtain evidence of the non-resident purchasing dealer's registration. The only method so far devised for this purpose is the declaration from system, which has been in force internally in West Bengal for some time and which has recently been proposed on an inter-State basis under the Interim Relief Measures agreed to by the State Governments for the levy of sales tax on non-resident dealers. The Chamber considers the declaration form system to be wholly impracticable, in that its abuse is inevitable and at the same time it seriously interferes with the smooth flow of trade. Moreover, it places an altogether unreasonable and unfair burden on the shoulders of the selling dealer, since on the one hand he is forced to do part of the tax collector's work and on the other hand he is involved in financial loss when he is unable to obtain, or accepts false, declaration forms from purchasers. The West Bengal Government introduced forms of declaration in 1952 and a year later admitted that business was being done on a large scale in blank declaration forms obtained by unscrupulous dealers under false pretences. They

APPENDIX I

Interpretation of Taxation Enquiry Commission's Note on Sales Tax, dated 7th April, 1954.

Category of goods	Inter-State Sales		Intra-State Sales
	Sales tax chargeable by exporting State	Sales tax chargeable by importing State	
1. Certain essential commodities	No tax	Presumably no tax	Presumably no tax
2. Certain industrial raw materials	Ceiling of 3 pies	Ceiling of difference between 3 pies and rate levied by exporting State	Presumably a ceiling of 3 pies
3. Certain consumer goods, also plant and machinery	(a) On sales to registered dealers, a ceiling of 3 pies (b) On sales to consumers, presumably a ceiling of 12 pies	Ceiling of the difference between the overall ceiling rate of 12 pies and the rate charged by the exporting State	Presumably a ceiling of 12 pies
4. Certain luxury goods	(a) On sales to registered dealers, nil (b) On sales to consumers, 12 pies	On sales by registered dealers to consumers, 12 pies	Presumably a fixed rate of 12 pies

have recently found it necessary to invalidate all unused forms and issue an entirely fresh series, to which monetary ceilings are attached. In the opinion of the Chamber the inter-State declaration system under the Interim Scheme will be open to the same abuse but on a much wider scale. The introduction of declaration forms under the scheme now suggested by the Commission is open to an additional and major objection. For the first time an exporting State would be levying tax on non-resident dealers and therefore for the first time a taxing State would have to rely on declaration forms issued by other State Governments and completed by dealers resident outside the taxing State's jurisdiction. It would seem that neither the selling dealer nor the taxing State would have any means of verifying the authenticity of such declaration forms.

8. For these and many other reasons it is felt that the proposals made in the Commission's note will not be at all helpful in solving the sales tax problems. The Chamber fully appreciates the difficulty with which the Commission is faced in endeavouring to find a solution which will at the same time (a) leave the States with a reasonably free hand, (b) remove the practical difficulties concerning inter-State trade and (c) provide adequate revenue. In the opinion of the Chamber there is no solution on these lines. If the States continue to have freedom of action, chaotic conditions will continue unless inter-State trade is completely exempted from tax, but under the latter condition diversion of trade and the incentive to evasion would become greater than ever. Therefore the only realistic conclusion is that the existing framework should be scrapped and however great the obstacles may be, the States must somehow be persuaded to surrender their rights to freedom of action. The way would then be clear for complete uniformity to be laid down by the Centre.

9. The Chamber therefore urges the Commission to give further consideration to the low-rate turnover tax which has been suggested on page 60 of the Chamber's replies to the Commission's questionnaire, the essentials of this tax being as follows:—

- (1) the method of collecting the tax would be a levy on the aggregate turnover of every trader in the country without exception in respect of all goods sold by him in India, also without exception;
- (2) the rate of taxation must be kept low to discourage evasion and to have a minimum effect on retail prices. It is suggested that it should be a very small percentage (e.g., one quarter of one percentum) of turnover, common to all India;
- (3) although the trader would not be permitted to pass on sales tax as a separate item, as at present, down the chain of distribution, the tax would in fact be passed on as a "sales tax" element in the consumer price in exactly the same way as other overheads are absorbed. It is hoped that this explanation of the intention removes any doubts the Commission may have had regarding the statement made by the Chamber in reply to the Commission's

questionnaire at page 60, para. 2, lines 8 and 9 and page 63, para. 2 of the reply to Question 127, namely that the dealer "would not be permitted to pass on the tax *as such* down the chain of distribution to the buyer or consumer". Since the tax will be absorbed as an overhead expense of his business, the dealer's selling price will already contain a sales tax element and he will not, therefore, be allowed to charge sales tax separately as is the case at present;

- (4) no State would be permitted to impose any additional sale or purchase tax on goods;
- (5) the rate of tax should be prescribed by law preferably in, and by way of amendment of, the Constitution;
- (6) the trader would be required to pay tax only to the State in which his business is situated;
- (7) if a trader carries on business in more than one State, then he should be assessed by the State in which each place of business is situated on his aggregate turnover in respect only of that place of business;
- (8) the tax would be allowable as a deduction for income-tax purposes;
- (9) although not an essential feature of the scheme, small traders may be charged an annual licence fee.

10. When the Chamber's representatives had the privilege of meeting the Commission on the 8th March, the Commission expressed the opinion that the Chamber's suggested system would not provide sufficient revenue. This point has been examined by the Chamber and it has been found possible to make an estimate of the revenue that may be expected. From the attached statement, it will be seen that on the assumption that the goods will have been taxed on the average at least four times before they reach the final consumer, a tax at the rate of $\frac{1}{4}$ per cent. would bring in a revenue of some Rs. 68 crores, which is just over the present total revenue, from this source. An increase to, say, a maximum of $\frac{1}{2}$ per cent. to allow for evasion, would still bring in a considerable surplus and even at this rate there would be no danger of adverse repercussions on the Central Government Exchequer in those cases where the levy of these is appropriate. The attached statement explains how the Chamber arrives at the figure of Rs. 68 crores and also quotes the statistical authorities on which it is based; in this connection, it is pointed out that the assumption that tax will be levied at four stages, on average, before the goods finally reach the consumer is, in all probability, an understatement and it may well be that the figure is six or even higher, in which event there would be a further increase in revenue.

11. The Chamber accordingly trusts that now it has been possible to indicate that there is no likelihood of a loss in revenue, the Commission will reconsider the Chamber's suggested scheme which would go the whole way towards removing the present sales tax difficulties and would be easily workable in practice.

APPENDIX II.

Statement showing the estimated revenue from sales tax under the multi-point low-rate turnover tax system suggested by The Bengal Chamber of Commerce and Industry.

Estimates are based on the approximate value of trade in India in crores of Rupees.

Item	Amount	Amount of Sales Tax at the rate of $\frac{1}{4}$ % at each stage	
		Amount	Cumulative Total
Value of Product—			
Agriculture	4805.00	(a)	
Animal Husbandry	1105.10		
Fishery	37.40		
Forestry	70.00		
Mining	83.30		
Factory Establishment	601.87	(b)	
Small Enterprises	911.00		
Imports	574.44		
Total value of product	8188.11		

Sources and Notes

(b) Monthly Abstract of Statistics, Oct.-Nov. 1953: Table 29 at p. 31.

Item	Amount	Amount of Sales Tax at the rate of 1% at each stage.	
		Amount	Cumulative Total
Less value of produce home-consumed, at wholesale prices . . .	3217·97 (c)		
Value of Trade in 1950-51 . . .	4970·14		
Add annual increment for 4 years at the rate of Rs. 307·21 crores per year (Amount of annual increment less trading income) . . .	1228·84 (d)		
Wholesale value of trade in 1954-55 at Stage I	6198·98	15·50	
Less Exports	561·96 (e)		
TOTAL	5637·02		
Stage II (Trading Income in 1950-51 plus amount of annual increments for 4 years)	691·25 (f)		
Value of Trade in 1954-55 at Stage II	6328·27	15·82	31·32
Stage III (Trading Income in 1950-51 plus amount of annual increments for 4 years)	691·25 (f)		
Value of Trade in 1954-55 at Stage III	7019·52	17·55	48·87
Stage IV (Trading Income in 1950-51 plus amount of annual increments for 4 years)	691·25 (f)		
Value of Trade in 1954-55 at Stage IV	7710·77	19·28	68·15

(c) Calculated on the basis of data given in para 2.9, 2.10, 22.13 of National Sample Survey; the Second Round, published in Sankya, March 1954.

(d) The Final Report of the National Income Committee: Table 28 at p. 106 and Table 25 at p. 83.

According to Table 25 page 83, of the Final Report of the National Income Committee, the gross trading income originating from products of agriculture, livestock, fishery, forestry, mining, organised industry, small enterprise and imports in 1950-51 is Rs. 1662·60 crores. National Income figures for the years 1948-49, 1949-50 and 1950-51 (please refer to Table 28, page 106, of the Final Report) indicate that the annual rate of increase is about Rs. 500 crores. The amount applicable to trade is calculated at Rs. 410 crores per year. This amount of Rs. 410 crores is made up of increments in the wholesale value of trade plus increments in the amount of gross trading income. On the basis of 1950-51 the proportion of the value of trade to the amount of gross

trading income is 74·93:25·07. Therefore, Rs. 307·21 crores represents the amount of increment in the value of trade and Rs. 102·79 the amount of increment in the trading income per year.

To arrive at the wholesale value of trade in 1954-55 the total amount of increments to be added to the figure for 1950-51 is (Rs. 307·21×4) crores=Rs. 1228·84 crores.

(e) Monthly Abstract of Statistics, October-November, 1953: Table 29 at page 31.

(f) To arrive at the gross trading income in 1954-55 the total amount of increments (Rs. 102·79×4) crores=Rs. 411·16 crores is added to the gross trading income for 1950-51, Rs. 1662·60.

The total gross trading income in 1954-55 is, therefore (Rs. 1662·60+411·16) or Rs. 2073·76 crores. The amount when split up into three stages comes to Rs. 691·25 crores.

नमो भगवते वासुदेवाय

Bengal National Chamber of Commerce

REPLIES BY THE COMMITTEE OF THE CHAMBER TO PART I OF THE QUESTIONNAIRE ISSUED BY THE TAXATION ENQUIRY COMMISSION.

PART I— TAX SYSTEM

Question 1

A. Taxation in modern States is now-a-days strongly influenced by social and ideological objectives of the Government in power. Classical theories on taxation, which have until some time back governed the taxation policy of the country, do not any longer hold the field, and policies in this respect are now-a-days being determined by the objectives which the Government have in the economic and social fields.

In the opinion of the Committee, the objective of the sound tax policy should be such as would conduce to the economic progress of the country.

B. The Committee consider that, of the various objectives mentioned in the question, the first three are all legitimate objectives, but the emphasis on the one or the other will depend on current conditions of economy. As a matter of fact, over-emphasis laid on one particular objective will adversely react on the two others. The Committee do not deny that it may be necessary in certain circumstances to reduce inequalities of income and wealth, but they have no doubt that too much stress on this objective would discourage incentives to work, to save and to invest—an objective which is no less important.

As regards the last item, the Committee consider that taxation policy should not and need not specifically relate to balance of payment position, as factors underlying adverse balance of payment are amenable to corrections through the pursuit of other objectives referred to in the question.

C. The detailed views of the Committee in regard to modifications of the Indian tax system, having regard to the first three objectives, have been elaborated in reply to questions in other Parts of the Questionnaire. They will here only state that, after the passage of the Estate Duty Act, no more stress need be given to the objective of reducing the inequalities of income and wealth and that there is, on the other hand, a case for relief from the rates for income-tax on higher incomes in particular. The Committee do not also deny the need for countering inflationary and deflationary tendencies, but they are of opinion that prices are not much influenced now-a-days by fiscal policy and the most important thing necessary for the modification of Indian tax system is to provide incentive to work and to save.

Question 2

A. In the opinion of the Committee, "equity" is not a relevant criterion in laying down a sound tax policy. It is very difficult to lay down standards to judge equity. What is more important is the economic consequences of a tax system, and a tax system should be condemned if it lowers standard of living of any section of the community and reduces incentive to work and to invest.

B. The question of securing equity in the Indian tax system does not arise for reasons stated above.

Question 3

The principle of "ability" has been adequately recognised in the Indian tax system.

A. In regard to the direct tax, a considerable element of progression has already been introduced and, subject to the observations made in answer to question No. 1, the Committee do not consider any further extension of the principle necessary.

B. As regards indirect tax which is now the accepted principle of the Indian taxation system, it is an adequate recognition of the principle of "ability" and there is not much scope for its extension.

Question 4

In answering this question, the Committee have considered two views which have been put forward, viz., that lower income groups pay small contribution *per capita* and higher income groups have been left with much unabsorbed taxable capacity. The Committee do not accept either of these views. In recent years, indirect taxes on luxury goods have very much increased as compared to the pre-war levels. If, further, increased cost of living is taken into account, there can be no doubt that the lower income groups cannot bear further taxes. As regards the higher income groups, the rate structure is sufficiently high and no further stiffening thereof can be conceived of.

Question 5

The Committee are emphatically of opinion that the proportion of tax revenue to national income in India cannot be raised any further. The percentage of national income to be collected as tax cannot be a matter of deductive and theoretical determination. The Committee fully recognise that in certain countries the percentage is higher than in India. At the same time, they are emphatically and unreservedly of the view that the current percentage cannot be raised in India because—

(a) the *per capita* income is the lowest in India, except in China as a result of population pressure, and

(b) only a small percentage of the people have comparatively large incomes and the taxable margin in an overwhelmingly large sector of the country is too narrow.

Question 6

Indirect tax currently occupies relatively a larger role in the taxation system than is the case in the tax system of progressive countries. On the other hand in a country like India where the number of persons covered by direct taxation is very small, the burden of direct taxation cannot be increased; on the contrary it needs suitable reduction.

The Committee would, in this connection, like to point out that any loss in indirect tax as a result of modifications in the rates need not cause budgetary problem because the lower price level as a result of the reduction in the rates and consequent higher profits will be reflected in the increased yield of direct tax without any alteration in the rates of the latter.

Question 7

A. No.

B. Railway freights already occupy too high a place in the Indian taxation system. Same is the case also with the rates charged by the Post and Telegraph Departments and any increase in the rates will naturally be reflected in the cost of production of the goods already made rigid by high price of raw materials and high wage structure.

As regards the industries which are being run by the State, the Committee understand that about Rs. 34 crores were invested in them before 1950-51 and that further sums of Rs. 82 crores and Rs. 11 crores have since been added by the Centre and the States respectively, making a total of Rs. 125 crores. The cost of operation of the State undertakings is necessarily very high for variety of reasons, and there is no scope for any further loading on profit made by these State undertakings. It is of course desirable and possible to make these undertakings yield a reasonable return on the capital advanced by the State, but the Committee consider that in the foreseeable future that State undertakings will not be in a position to make any significant contribution to the Public Exchequer.

Question 8

The Committee do not generally object to the funding or allocation of tax receipts for specific purpose. Much will, however, depend on the merit of each particular case. In recent years, such specific and *ad hoc* taxation has been treated as handy by the Government. Mention may be made, in this connection, of the sugar export duty and the cotton excise duty.

Question 9

In regard to the cesses, most of them are generally levied on the different crops. The system of utilising the receipts from the cesses for particular purposes has already come to stay as in the case of tea, cotton, etc. As the matter is not, however, one which can be subjected to theoretical examination, the Committee do not consider that there is much scope for any further extension of the crop cess system. They are of opinion that except for tea where the proceeds of the cesses are utilised for propaganda purposes and, subject to the views expressed by them in reply to question 122, the expenditure incurred in connection with scientific researches should be financed from the general revenue, particularly in view of the fact that the Government have recently set up a number of national laboratories.

Question 10

In the limited field where State commercial and industrial undertakings are in operation or may conceivably operate in near future, the only justification

from the economic stand point is the higher standard of services to the community that may be rendered by these State undertakings as compared to what can be provided by private company of average sound management. The Committee do not therefore, favour any pricing policy being followed by such State undertakings so as to earn a significant revenue. The Committee are of opinion that it should be the policy of these undertakings to render maximum services at a low price and not to aim at earning additional revenues for the purpose of helping the Public Exchequer.

The question of further extension of State undertakings from the fiscal point of view does not arise.

Question 11

Any surplus earned by State undertakings, such as may result without pursuing a deliberate pricing policy based on private earning, should, in the first instance, be ploughed back to the undertakings to the extent the amount re-invested is required for increasing labour productivity. Any additional surplus that may not be usable for such purpose may be paid to general revenues. But as State undertakings are not expected to pursue a deliberate pricing policy, the Committee do not envisage accumulation of large surplus.

Question 12

A. All the factors mentioned in the question should be taken into account.

The Committee are also of opinion that population should be divided into two categories, rural and urban, each in its turn being sub-divided into occupation and income groups.

B. There is no other basis which may be considered in this connection.

Question 13

(a) As mentioned in the reply to question No. 2, it is very difficult to examine the relative burden of the present tax system on the various classes of people.

(b) The distribution of the tax burden among different States is closely connected with the various standards of their financial needs, and any lack of balance in this respect has to be remedied not by changes in the tax system but by differential assistance by the Centre to the States. The question is one which can be properly tackled by the Finance Commission. The Committee may, however, state here that they are not satisfied with the recommendations made by the last Finance Commission.

Question 14

No precise data is available to show the shifts in the distribution of income and the relative incidence of taxation on various classes of people, though it is held in certain quarters that the income of the rural sector has now increased. It can, however, be said that the middle classes have been particularly hard hit.

Question 15

Yes. The details have been given in reply to questions included in Part III of the Questionnaire.

Question 16

The benefits accruing from public expenditure have certainly a bearing on the burden of taxation but it is not possible to establish any direct and workable correlation between the two.

Question 17

Reference has been made in replies to questions included in other Parts to a number of industries, on which the tax burden weighs particularly heavy.

Question 18

The Committee are strongly and emphatically of opinion that in financing development programmes major reliance should be placed on long term borrowing from the community.

Question 19

Of the five-fold methods suggested in the question, the Committee would lay particular emphasis only on the first, namely, economy and rationalisation in expenditure.

As regards prevention of tax avoidance and tax evasion, the Committee consider that there is some but not much—scope for improvement in tax collection by tightening administration. At the same time, they would point out that considerable harassments are already being caused in the collection of taxes and any tightening in administration will be welcomed only to the extent evasion can be prevented without causing unnecessary harassments.

The Committee are definitely against the suggestions made regarding increasing the rates of existing taxes, imposing fresh taxes and developing of non-taxable resources. The Committee, however, generally agree

with the suggestion for re-imposition of salt duty subject to the observations made in reply to Question No. 124.

Question 20

As mentioned in the reply to question No. 18 the Committee would suggest major reliance being laid on long term borrowing for the development programme of the country in the public sector. Unfortunately, the level of taxation has already been raised too high in India and savings in the hands of the community, both individual and corporate, are almost non-existent. It is, therefore, necessary to make a thorough re-adjustment of both direct and indirect taxation, so as to ensure savings from current income. Equally important is the need for making efforts to reduce the cost of production and lower the cost of living.

Question 21

It follows from the observations made in reply to the last question that the rates of taxation, particularly direct tax, should be so revised as to leave far larger savings at the corporate level in order to stimulate capital formation.

As regards the reaction of such a policy on public sector, the Committee would point out that even under existing rates of taxation new money will be required to be created for the *ad hoc* purpose of financing development programmes. The reliefs, which in the opinion of the Committee is necessary to stimulate capital formation in the private sector, will, therefore, require only some extension of the *ad hoc* finance to be created for development outlay in the public sector.

In this connection, the Committee may draw attention to the fact that want of spirit of co-operation on the part of the income-tax authorities and harrassing enquiries by them about the sources of investment of capital, is retarding investment in the private sector to the detriment of the interests of the economy of the country.

Question 22

(i) In the absence of reliable data readily available regarding the rate of new investments in India before the War, it is difficult to compare the rate of that investment with the current rate of capital formation which, so far as the private sector is concerned, is predominantly industrial in India. The amount of capital for industrial purpose, for which consent has been given by the Controller of Capital Issues, will unmistakably show that the investment demand for new investment purpose and, therefore, the annual rate of capital formation is largely on the decline.

While not subscribing to any kind of political partisanship, the Committee are, nevertheless, of opinion that the following factors have accounted for the decline in the formation of capital:

- (a) The psychological factor working in the mind of many entrepreneurs under a system of growing regimentation of industrial economy;
- (b) fixing of prices of raw materials by the Government without reference to their effect on the economy in general;
- (c) continued labour unrest and the demand for increases in wages and for the grant of amenities to labour irrespective of the ability of the employers to meet them;
- (d) steady change in the economy to a buyers' market;
- (e) high rates of taxation; and last but not the least;
- (f) stagnation in the long term investment market.

(ii) There has not been much of a shift in the sources of capital formation in the private sector, except that Corporations are using up all reserves and exhausting their little funds and that institutions like Industrial Finance Corporation are supplying long term capital to some extent.

Question 23

In the opinion of the Committee, tax relief in respect of middle income group would assist the growth of savings and promote consumption consistent with their needs.

Question 24

The Committee feel that the assumption of the Planning Commission of 50 per cent. of the additional output going into investment is rather on the high side as the majority of the people is living on the subsistence level, and at the same time, the population is increasing at the rate of 1½ per cent. annually. The Committee are also opposed to restriction on consumption as this may adversely affect the consumer goods industries.

Question 25

In the opinion of the Committee, a careful assessment of the current economic situation in India would show that, except in limited income groups, the standard of living has not risen in any segment. The question of reducing consumption standards should not, therefore, rise except in the higher income group, in which case, however, the level of taxation is high enough so far as direct tax is concerned, and any further rise will be ineffectual so far as indirect taxes are concerned.

Question 26

In the opinion of the Committee, a tax system may have negative reactions on the productive efficiency. The Committee are not very sure as to how far possible improvement of the tax system can, singly and by isolation, increase efficiency of production. But there are, in their opinion, a number of cases in which the removal of disagreeable features of the tax system will be reflected in varying degrees of improvement of efficiency.

The multiplicity of tax, in regard to which an industry, for instance, has to prepare multiplicity of papers and documents and deal with multiplicity of authorities, definitely increases cost or prevents its available resources being utilised towards improved efficiency.

It is certainly true that the lack of uniformity, as amongst States' taxation on industrial goods or services, will prove a deterrent factor. For themselves, the Committee have always, from business point of view, upheld the principle of uniformity in inter-State taxation (*vide* answers relating to Excise and Sales Taxes).

Question 27

In the opinion of the Committee, the tax system in India may, in certain circumstances, be used to secure some order of priority in the development programme of the private sector. But, for all practical purposes, the scope is confined to actions granting rebate on customs duties on raw materials imported from foreign countries. No broad formula can, however, be formulated in this behalf, each specific case requiring careful and expert investigation.

Question 28

The question raises a policy issue of major importance and the views of the Committee are stated below:

- (a) The scope for influencing over-all demand by a change in tax policy is extremely limited. By its very character, such changes can be only of small magnitude and, the rigidity of consumption standard being what it is in middle and lower income groups, no spectacular variation in over-all demand following tax changes can be expected. In the very nature of things, such demands are more amenable to influence by monetary policy.
- (b) Efforts directed towards reducing consumption and eliminating inessential investment will certainly make for large savings in the hands of the community. But, in Indian conditions, this by itself, will not serve the purpose referred to in the question. Special steps will have to be taken separately to channel increased savings towards productive investment. Besides, as mentioned in answers to some of the previous questions, scope for reducing consumption is extremely limited in India.
- (c) Positive inducements for desirable investments will certainly yield results, but only up to a point. In the lower and middle income groups liquidity preference is much higher in India than in industrialised countries, and investment of these groups is 'interest elastic'.

In answering this question both direct and indirect financial investment has been taken into account.

- (d) A tax policy designed to re-distribute income from the higher income group to lower income groups can only be effective under a programme of free social service system. There is already considerable progression in the direct tax system in India, but the pursuit of such a tax policy is limited by the fact that at a certain point disincentive for investment in risk assumption sets in. What that point is not easily determinable, at least by a rough and ready method.
- (e) In the view of the Committee a tax policy is more significant in its negative results on the economic activity of the community and its functional value as a positive policy is chiefly confined to (c) and (d) above.

Question 29

This question also raises issues of major scientific importance and was partly anticipated in reply to question 28(a). The Committee are of opinion that the average standard of consumption in India being what it

is, a fiscal policy is wholly inadequate to deliver the goods for large investment outlay under a planned economy. Increased reliance should, therefore, be laid on monetary policy than that has hitherto been done. To the extent investment in public expenditure is directed towards short yielding schemes of production, whether of consumer of producer goods, a policy of creating new money appears to the Committee to be justified and, at any rate unavoidable.

As regards control of an over-all character in the various sectors of economy such as wage, price regulation, direction of investment, and volume of production, control is not, in the opinion of the Committee, a policy alternative to fiscal or monetary policy but is coordinate to them. The point which the Committee desire to express is that control should not be so used as to give rise to a mal-adjustment between income and prices or to distribution of income unrelated to the productivity factors.

Question 30

Yes.

A progressive direct tax, the Estates duty and indirect luxury and excise taxes tend to bring about some levelling of income, although for a variety of reasons such levelling is not practically demonstrable in the current context.

Question 31

The Committee have no suggestion to make towards the object specified under the conditions set forth in the question.

Question 32

As already anticipated in reply to question 28(d), a redistribution of income and consequential economic equality is attainable largely under a social security system and, theoretically speaking, the scope for increase in public expenditure on such social services is low in relation to the tax revenue of the Government. The Committee, however, consider that whatever theoretical justification there may be for such increased public expenditure, it would be gravely risky to intensify such policy in the present state of economy for, particularly when there is a severe strain on investment in relation to the development programme of the Government.

Question 33

No, except to the extent of any relief that may be granted in regard to double taxation. The Committee, however, admit that agreement for preferential treatment may be entertained in specific cases.

Question 34

The Committee would answer the question in the negative.

Question 35

The Committee are strongly opposed to tax on capital and their views in regard to the re-introduction of the salt duty and modification of the policy of prohibition have already been stated in appropriate section. The Committee have observations to make in regard to the other taxes mentioned in the question.

Question 36

There is no case for taxing earned increments in the value of agricultural land in view of the economic objectives underlying the development projects and the new agricultural land legislation which has been or is being adopted in every State.

The question may, however, be raised with regard to non-agricultural land in project areas now under process of urbanisation. This process is, however, at its very initial stage and having further regard to the operation of the Estate Duty Act, the Committee do not favour levy of an improvement tax thereon.

Question 37

Suggestions towards increasing the receipts from the existing sources of revenue have been made in reply to question in other parts.

One point, however, on which the Committee would like to lay great stress is that lowering of rate is, in many cases, likely to be more productive in their yield than what they are at the current rates.

Question 38

The considered view of the Committee is that, in most income sectors, there has been a fall in real income in relation to which the tax burden is already heavy and the committee have no suggestion to make to add to the list of existing taxes and thus further deteriorate the current of over-taxation.

Question 39

In view of the observations made in reply in previous question, the Committee would answer this question in the negative.

Question 40

Vide reply to Question 1.

Question 41

Vide reply to Question 28(a).

Question 42

The Committee do not consider that the capacity of a tax system for countering either inflation or depression (by which they understand the influence on general price level or the changes in money supply position in the country) is a matter for determination by its inherent character. On the other hand, the price influencing potential of a tax system is determined by the General level of development of the economy. If the velocity of income and money circulation in India would markedly improve, such influence on the price level shall be exercisable by the tax system, but, pending such development, a tax system will not be a significant factor in relation to prices.

Question 43

The views of the Committee have already been covered in replies to earlier questions.

Question 44

The Committee have one important tax change to suggest, namely, in relation to customs duties. All customs duties should, to the maximum possible extent, be fixed on *ad valorem* basis and not on specific basis. In order, however, to safeguard the interest of consumers of imported goods specific ceiling should be made effective side by side with *ad valorem*. In other words, import duty may be fixed at a particular rate percent or particular value per unit of measurement whichever is lower instead of whichever is higher.

Question 45

The current price situation is not influenced by monetary factors but the inflationary character of the current price level is determined entirely by the current level of costs including the indirect taxes and goods such as import and customs duties. It is in this sense that there is a fiscal arrangement in the present level of high prices. In order to forestall a probable buyers' resistance or the effect of world recession in prices, it is necessary to eliminate this fiscal element in the cost structure to the maximum extent possible.

PART II.—DIRECT TAXES**INCOME TAX****Residence****Question 46**

For reasons mentioned in reply to Question 67, the Committee are of opinion that the category of "Hindu Undivided Family" should be abolished.

They are further of opinion that there is no justification for the retention of the category described as "not ordinarily resident", as there are very few assesseees coming under this description.

Income**Question 47**

Subject to the observation made in answer to the Question 48, the definition of "Income" appears to be satisfactory.

Question 48

Subject to the observations made below, the answer to the first part of the question is in the negative.

The Committee are, however, of opinion that the agricultural portion of dividend in the hands of a Company distributing the same should be considered to be agricultural income in the hands of the recipient shareholder also, and should, as such, be exempted from Central taxation.

Objections have been taken to the proposal for taxing capital gains on the ground that it would retard the formation of capital. It has also been stated that in view of the Estates Duty Act having already been passed, there is no longer any pressing need for taxing capital gains.

While there is undoubtedly some force in these contentions, the Committee would also draw attention to the very high rates of income-tax on higher incomes, which are very much regressive in character and retards formation of capital to a much greater degree than would be the case if capital gains are taxed. They are indeed of opinion that capital formation will be encouraged if these high rates are suitably reduced simultaneously with taxing of capital gains beyond a certain minimum limit.

Question 49

No comments.

Question 50

No change is necessary. "Bonus shares" should not be included in the definition of "dividend".

Question 51

It has been brought to the attention of the Committee that considerable difficulties are being experienced in the application of Sections 42 and 43 of the Income-Tax Act and that the interest of persons engaged in foreign trade are being affected adversely. In particular, no uniform practice is observed by the Income-tax Officers in interpreting the expression "business connection" and other provisions of the Sections also. The Committee would, therefore, suggest that rules should be framed by the Central Board of Revenue determining the liability of the exporter in cases covered by Sections 42 and 43 and also defining "business connection".

Question 52

The definition of "Agricultural Income" appears to be quite satisfactory and does not require any modification. Difficulty arises only in the application of the principle of spontaneous growth of agricultural produce. There can be no doubt that the same income should not be taxed twice once by the Central Government and again by the State Government and there should be a machinery set up jointly by the Central and State Governments for making mutual adjustments.

Question 53

The Committee are not in favour of integrating agricultural income with non-agricultural income for rate purposes.

Question 54

No.

Question 55

The Committee would prefer that income should be averaged over a number of years where receipts are irregular and fluctuating.

Exemptions**Question 56**

The Committee do not think that the present provisions regarding exemption of charitable and religious trusts require any modification.

Question 57

No comment.

Question 58

The concessions given to new industrial undertakings under Section 15C of the Income-tax Act should be continued.

The concessions have not been made infructuous as a result of initial and extra depreciation allowances which are allowed only on new machineries and buildings, while some of the new undertakings have old machineries and buildings in respect of which these allowances are not operative.

Besides, the value of the concessions under Section 15C as an incentive to new industrial development cannot be exaggerated.

The Committee would further suggest that the concessions should be extended also to all industries which are started within a period of 10 years from 1st April 1948, and that the concession should apply to the assessments for 10 years instead of for 5 years as at present.

Question 59

It is not clear from the terms of the question whether relief beyond avoidance of double taxation is sought in respect of profits of foreign branches of Indian banks. It would seem fair, however, that this question (whether limited to relief of double taxation or not) should be regarded as part of the wider question of encouraging exports, invisible trade and other forms of foreign exchange earnings. Any policy of concessional treatment, if decided upon, should be equally applicable to insurance companies and shipping companies also operating and making profits abroad; and banks as such do not seem to call for any special treatment.

Question 60

Yes. At present one-sixth of the income paid as life insurance premium, subject to a maximum of Rs. 6,000, is exempted from taxation. This rule regarding exemption from tax of life insurance premia was made long ago, since when the general price level has increased many times. In consideration of the corresponding fall in the value of money, the exemption limit should, therefore, be raised to 1/5th of the income instead of 1/6th, as at present, subject to the maximum of Rs. 12,000.

Further, in view of the recent enactment of the Estate Duty Act, people will have a growing tendency to invest their income in taking out Life insurance policies rather than buying real properties, if the present limit of exemption from tax of life insurance premium is raised, thereby placing more funds in the hands of the Government and helping implementation of the Development Plan.

Allowances.

Question 61

(i) Yes.

The Committee are in favour of the grant of larger depreciation allowances by treating the excess of replacement cost over original cost as revenue expenditure.

(ii) The fundamental justification for assistance has been furnished by the Commission themselves in Question (i) above. It is not possible for many of the industrial concerns to secure the necessary finance entailed by the increased costs of replacements of assets. It cannot be gainsaid that the economic development of the country will be held up if the industries are not able to replace new and modern machinery with higher efficiency due to lack of necessary finance. Besides, the financial value of the assistance is also not very great, except that payment of the tax is deferred.

(iii) The Committee are of opinion that, if adequate depreciation allowances are granted by the Government, they would be perfectly justified in requiring the industries concerned to bank the amounts, so allowed, separately in a joint account with the Government as was the practice followed at the time the Capital Issue Control Scheme was in operation.

Question 62

No.

Question 63

From the nature of its operations, the mining industry consumes the whole of its capital in the course of production. On the exhaustion of a mine, apart from the minor amount represented by the residual value of recoverable machinery, the capital invested therein, including extensive surface buildings, is totally lost. To enable the mining industry to set aside sufficient funds to develop and work new mines and deeper seams when existing working are exhausted, a special form of depreciation allowance should be granted. For the sake of simplicity and administrative ease, the Committee would suggest a percentage depletion rate.

The object of any such allowance should be to write off the cost of all capital assets whose life is limited by the life of the mine. The value of land and mining rights, exploration and the cost of works which are likely to become valueless on exhaustion of the mine should be aggregated, and the resultant figure should be subjected to an initial allowance of 10 per cent. and an annual allowance of 5 per cent., such annual allowance being calculated on cost and not on the written-down value.

Question 64

The Committee are in favour of providing specific allowances for family and dependents who are the immediately direct relations of the assessee. They are of opinion that, if this is agreed to, it may not be necessary to exempt the first slice of income from tax.

In regard to providing specific allowances to family and dependents, the Act should specify the particular categories of dependents for whom allowances should be granted and, if necessary, the total number of dependents also should be fixed.

No separate treatment to Hindu Undivided Family is necessary, as the Committee are of opinion that this particular category should be abolished.

Question 65

(i) In addition to the items of expenses now allowed, there should be specific provisions for allowance of the following items of expenses:—

(a) Motor Car Expenses—

In the matter of carrying on of professional or business activities, the maintenance of a car is now a days indispensable. Though some times cars are also utilised for personal purposes, such occasions are very rare, and the Committee are of opinion that there should be no hair splitting as between the expenses incurred for carrying on the professional or business activities and expenses for personal use.

(b) Entertainment Expenses—

Such expenses are often necessary for promoting maximum interests of the firms and should be allowed.

(c) Gratuity, Bonus, Commission, etc.—

Payment of gratuity, bonus and commission is often necessary in the interest of the firm and, besides being sometimes statutorily enforced, are also paid as reward to the efficient and honest workers.

(d) Partners' Expenses—

When Partners go out on inspection to Branches, their Boarding and Lodging expenses should not be considered as personal expenses.

(e) Subscriptions—

Subscriptions paid by professional men to Chambers of Commerce and other institutions for membership should be charged against Income. Such expenses are, at present allowed to business firms.

(f) Legal Expenses—

Legal expenses incurred in connection with appeals before the Appellate Assistant Commissioners and the Income-Tax Appellate Tribunal and Reference before High Courts and the Supreme Court, as well as Legal expenses incurred in connection with any business affairs of an assessee (not being for acquisition of capital assets) including prosecution of defence of persons in any proceedings relating to any matter connected with business, should be allowed.

(g) Cost of renewal of leases.

(h) Patent and Copy-right expenses.

(ii) Expenses which are now admissible are all business expenses and should be continued to be allowed.

Rate Structure.

Question 66

(a) The Committee are not in favour of combining Income-tax and Super tax into a consolidated levy.

(b) (i) Assessee—

Assessee will not derive any practical benefit from this combination except that, in the matter of exemptions, they may get rebate at a high rate while paying the tax also at a higher rate. On the other hand, there would also be a possibility of lower income being assessed at a high rate.

(ii) Administration—

The advantage, so far as administration is concerned, would be the facility in computing the tax liabilities.

(c) The degree of progression in the present rate structure is not quite satisfactory. While incomes in the lower groups would deserve a lower rate, the high rates of tax, both income-tax and super-tax, in the higher slabs of income definitely retard the formation of capital by destroying the incentive to work and to make profit.

As the Committee have stated in their preliminary memorandum, private enterprise cannot thrive under a system where all incomes exceeding Rs. 1.5 lakhs are taxed at the rate of 0-12-6 in the rupee with a surcharge of 1/20th of the tax, and it is essential that the rates on higher incomes should be considerably reduced and the ceiling, at which the maximum rate has to be charged, should be raised to a much higher figure than at present. The Committee sincerely hope that the Taxation Enquiry Commission will consider this aspect of the question very carefully.

(d) No comments.

(e) No.

The surcharge, as now levied, is automatically graded as the rates of tax are graded. No further gradation is, therefore, called for.

Question 67

(i) Individuals—

The exemption limit for individuals has necessarily to be changed from year to year according to the prevailing economic conditions and the need for revenue on the part of the Government.

(ii) Hindu Undivided Families—

In considering the question of the exemption limit for Hindu Undivided Families, the Committee would draw attention to the fact that the Undivided Family, as a separate category, is being taxed only in the case of Hindus and that, according to the present system, the incidence of the tax falls, in many cases, on the members of a Hindu Undivided Family more heavily than on other assessee. Though it is true that the taxable minimum is double in the case of a Hindu Undivided Family, the concession is actually of no value when the family consists, as it usually does, of more than two members.

The Committee are, therefore, of opinion that the Hindu Undivided Family, as an entity, should be abolished.

ed and the persons, who are at present taxed as members of such a family, should be assessed as partners of a firm.

DIFFERENTIATION

Question 68

(a) Yes.

The economic justification for the distinction is that an assessee has to exert himself for earning an income while in the case of certain particular forms of income he has not to make much effort himself. The distinction should be continued in order to provide an incentive for profitable work.

(b) Yes.

(c) The quantum of relief now afforded should be extended rather than reduced and the maximum amount of relief should be increased at least to Rs. 10,000 instead of Rs. 4,000 as at present.

MISCELLANEOUS

Question 69

The Committee are of opinion that the basis of valuation of stocks for assessment purposes, viz., "the cost or market value whichever is lower" should be followed.

Question 70

As already stated, the Committee are in favour of the abolition of Hindu Undivided Family as a category.

Question 71

Exemption from income-tax should be allowed in respect of such part of Managing Agency commission as may be voluntarily surrendered by Managing Agents.

While no safeguard is necessary in case of "bona-fide" surrender, the Committee would suggest that provision may be made so that no such commission as may be voluntarily surrendered, may be recoverable in any circumstances in the future.

Question 72

The Committee consider that the Double Income-tax Avoidance Agreements between India and Pakistan may be used as the model for similar Agreements with other countries.

It needs hardly be stressed that a person should not be made to pay tax on the same income in two countries. The country in which the income originates must have a preferential claim in the matter of levying tax on that income. In the matter of taxation of foreign income in India, therefore, such income should be considered for the purpose of rate only. The important point, in this connection, is to find out the country where the income originates, on account of some sort of business connection between two countries or as the result of a continuity of processes of activities between the two countries. The schedule to the Double Income-tax Avoidance Agreement between India and Pakistan appears to be a satisfactory one and this schedule may be followed with such adjustments as may be necessary.

A further important point which the Committee would like to stress is that the difference in the quantum of foreign income computed in the two countries should be left out of consideration. It will be sufficient if evidence is produced before Indian Tax Authorities that the foreign income has suffered taxation in the country of origin.

Question 73

(a) The present law relating to determination of "bona fide annual value" of property and deductions allowed from it, is on the whole satisfactory, except that in the case of property let out on long lease, the annual value is now being determined on the "notional" rent receivable from year to year rather than on the actual rental value. This should be rectified.

(b) As regards the deductions, the Committee are of opinion that the following items should be included:—

- (i) Owner's share of Municipal tax, in addition to the occupier's share.
- (ii) Expenses for maintenance of lifts, electric pumps, tubewells, etc., and the depreciation allowance on their costs and the cost of passage electric lights.
- (iii) Increase in the repairing charges from 1/6th of the bona fide value to 1/4th on account of the high cost of repairs.
- (iv) Such portion of unrealised rent, about the collection of which there is no possibility, subject to the proviso that any portion of such rent subsequently realised should be included in the bona fide rent value in the year of collection.

(v) Cost of litigation, excluding proceedings relating to title.

Question 74

The Committee would answer both the parts of the question in the affirmative.

Question 75

The Committee would suggest that provision should be made for according special treatment in hard cases where assessee are not able to make advance payments due to lack of fluid resources.

Question 76

The Committee do not object very much to the principle underlying Section 34. But they have two observations to make in this connection.

In the first place, they regret very much that the Amendment Act of 1953 has given retrospective effect to the provisions of sub-sections (1), (2) and (3) of the Section, as previously amended in 1948, thereby validating notices issued under the Section and the assessments made in pursuance thereof for the assessment years prior to the 1st April 1948.

In the second place, attention may be drawn to the fact that, in regard to the rectification of mistakes to be done under Section 35, having the effect of enhancing an assessment or reducing refund, there is a provision of giving notice to the assessee of any action to be taken and of a reasonable opportunity being given to him of being heard.

The Committee would suggest that, before any action is taken under Section 34, a similar procedure should also be followed and the Section should be amended accordingly.

Question 77

No comments.

Question 78

The Committee do not support the proposal that the Appellate Tribunal should be allowed to enhance assessment in the same manner as the Appellate Assistant Commissioner. There is no justification for vesting the highest judicial body with executive functions. This will complicate matters, as the Appellate Assistant Commissioner already exercises this power after having reviewed the whole matter. Further, wide powers of re-opening assessment provided for in Section 34 amply safeguard any loss of revenue due to under-assessment.

TAXATION OF COMPANIES AND SHAREHOLDERS

Question 79

Yes.

The Committee would suggest that incomes not exceeding a particular figure, say Rs. 10,000 should be altogether exempted from the levy of the Corporation Tax and that an element of progression should be introduced up to a total income of Rs. 50,000.

Question 80

(i) Small Industries—

At present a rebate of 0-3-0 in the rupee on the total income is allowed to a public company with a total income not exceeding Rs. 25,000, only if it deducts super-tax from dividends payable to a shareholder who is believed to be not a resident in the taxable territories. The Committee would suggest that, subject to such exemptions as may be made in accordance with the recommendation made in answer to question 79 and apart from any measures that may be taken for the deduction of super-tax from dividends in accordance with the provisions of sub-sections 3(D) or 3(E) of Section 18 of the Income-tax Act, the Corporation tax on all Companies, whether private or public, engaged in manufacturing activities, with a total income not exceeding Rs. 50,000 should be fixed at a rate lower than that fixed for those having an income in excess of this figure.

(ii) Cottage Industries—

The concession recommended above for small industries should also cover the case of all companies engaged in cottage industries.

(iii) Private Limited Companies or Proprietary Companies—

Subject to the answers given in reply to Question 79, the Committee do not consider that any special concession should be granted to Private Limited Companies or Proprietary Companies except to the extent that they are engaged in manufacturing activities and have total incomes not exceeding Rs. 50,000.

(iv) Holding Companies—

Subject to reply made to Question 79, no special treatment need be given to holding companies.

Question 81

The demand for the exemption of inter-corporated dividends from Corporation Tax is justified on the

ground that such dividends pay Corporation tax once in the hands of the Company distributing the same, next in the hands of the recipient shareholder Company and, thirdly, in the shape of super-tax in the hands of the individual shareholders of the latter Company.

Question 82

A. (a) Banks—

Yes.

The present situation regarding allowance for bad debts in a bank's business often tends to produce arbitrary decisions and appears to violate the well recognised canon of taxation concerning "certainty" of incidence of a tax. The making of allowance and advances represents a distinctive feature and accounts for a substantial portion of a bank's business, and may be compared to the fixed capital assets of a manufacturing concern. In the circumstances, it is only fair that, in conformity with the practice followed in respect of depreciation of fixed assets, bad debts should be allowed in determining a bank's net profits, subject to adjustments later on in the event of future realisation.

The Committee would prefer this allowance being granted according to a fixed schedule. For, if the allowances were to be determined by the Income-tax officer in each case, on an examination of the necessary accounts, it would involve an intriguing process attended with embarrassing results. Section 10(2)(XI) of the Income-tax Act should be amended accordingly.

B. Insurance Companies—

Yes.

(a) The present system of surplus basis of assessment of Insurance Companies is inequitable and unjustifiable and calls for a change. At present only 80 per cent. of the surplus paid to, or reserved for, or spent on behalf of, policy holders is exempted from taxation. The Committee are, however, of opinion that the policy holders' surplus should be entirely tax-free as in the U. K. In justification of this suggestion, they would point out that in calculating the premiums, a conservative actuary assumes a mortality more adverse than what is expected to be experienced by the policy holders as also a rate of interest lower than what is expected to be realised on the mean life insurance fund. This is done deliberately with a view to provide margins on both these items and thus strengthen the financial position of the Company. Any benefit to the policy holders from such extra mortality and interest loadings should not, therefore, be subject to tax. It is primarily because of these considerations that policy holders' surplus is wholly exempted from taxation in the U. K. and it seems desirable that this just principle in the matter of assessment of all life insurance companies should be recognised in India also.

(b) In respect of assessment of life insurance companies, there should be no discrimination between Mutual Companies and Proprietary concerns. In the case of the former, 100 per cent. surplus goes to the policy holders and, in the case of the latter 92½ per cent. The remaining 7½ per cent., meant for shareholders, being taxed in the usual way, the quantum left for policy holders in the case of both types of Companies should be treated in the same way.

Question 83

A. The existing provisions regarding the differentiation of distributed and undistributed profits of Companies for tax purposes is not entirely satisfactory. It is true that undistributed profits are at present taxed at a lower rate, but the Committee feel that, subject to the qualification mentioned below, undistributed profits should be entirely exempted from the liability to pay tax. Capital formation has in recent years been very much retarded on account of the high rates of income-tax on higher incomes as well as of the Corporation tax. Industrial Companies are, as a matter of fact, finding it extremely difficult to find new capital either for expansion or for rehabilitation of their machinery and, if the entire portion of the undistributed profits were exempted from taxation on condition that the amount so undistributed should be ploughed back to the industry and used for expansion or for rehabilitation of machinery, there will be an incentive on the part of the Companies to set aside a comparatively small amount for distribution to shareholders and utilise the balance for expansion. The Committee hope that, in the interest of the industrial development of the country, the Commission will kindly consider the question of exempting the undistributed portion of the profit entirely from the scope of taxation.

B. For obvious reasons, the Committee are of opinion that the concession should be extended to all industrial concerns and should not be restricted to particular industries.

C. (a) To safeguard against the misuse of the concession regarding undistributed profits, particularly by Private Limited Companies to its shareholders, the

Committee would suggest that adequate provisions should be made limiting advances or temporary loans to shareholders, Directors or other persons only to those cases where it can be definitely established that such advances are in the interest of the Company itself. A further provision should be made requiring a three-fourths' majority of the shareholders to any proposal for such loan or advance.

(b) To ensure that profits are actually applied for production purposes, the auditors of the Companies may be required to furnish necessary certificates which should be incorporated in the Balance Sheets of the Companies for the year following the accounting period.

D. The provisions of Section 23-A of the Income-tax Act are not very satisfactory for reasons stated below :—

(i) The provisions of the Section are applicable to "assessable income" of the Company of the previous year, as reduced by the amount of the income-tax and super-tax, payable by the Company in respect thereof. There is, however, no provision for reducing the "assessable income" by the amount of any tax levied by the Government of a State or by the local authorities.

The Committee are of opinion that the "assessable income" should be determined only after all taxes payable by the Company either to the Central Government or to the Government of a State or to any local body, whether or not such tax is wholly or partly an admissible deduction under Section 9 or Section 10 of the Act, are deducted from the said "assessable income".

(ii) Even after deductions are made in accordance with the suggestion made above, the assessee Company may be in difficulty because of the inclusion therein of a notional income not represented by corresponding cash receipts.

In such cases, the Company is placed in disadvantageous position in paying the tax on income which has not been actually received by it in cash.

(iii) A further difficulty arises because of the practice of Income-tax Officers in assessing profit after adding back payments like charity, capital expenditure, etc. and after disallowing certain amounts that may have been written off as bad debts. The experience which the assessee have of the manner in which assessments are made by the Income-tax officers justifies their apprehensions about the great disparity between the actual income of a Company and the "assessable income" as computed by the officers.

The Committee would, in this connection, draw attention to the observations made by the Income-tax Investigation Commission in paragraph 92 of their Report admitting that the difference of opinion or in the method of calculation between the assessing officer and the Companies' officers may be perfectly "honest", and suggesting a number of relaxations, which should receive careful consideration from the Taxation Enquiry Commission.

The Commissioner had suggested that as, by reason of an honest difference of opinion or in the method of calculation between the assessing officer and a company, the amount distributed may prove to be less than 55 per cent., insisted on by the second proviso to the Section, as a condition precedent for giving a *locus penitentie* to the company for escaping a penal order under this section, the proviso should be enlarged so as to include cases where the distribution actually made has fallen short of 60 per cent. of the assessable income by reason of the assessing officer determining the assessable income to be greater than it was according to the calculations made by the company. The Commission also recognised that, even after this relaxation, some cases might present special features. They pointed out that, though Section 23-A authorises the Income-tax Officer to make an order under sub-section (1) only "with the previous approval of the Inspecting Assistant Commissioner", it is possible to contend that all that the Inspecting Assistant Commissioner can consider, when asked to approve of a proposed order by the Income-tax Officer, is whether the conditions prescribed in the sub-section have been satisfied, and not exercise a discretion *de hors* the Section. They, therefore, suggested that, in addition to the provision made in sub-section (2) requiring the Inspecting Assistant Commissioner not to give approval to the Income-tax Officer's proposed order until he has given the company an opportunity of being heard, there should be a further provision to the effect that the Inspecting Assistant Commissioner may, for reasons recorded by him in writing, withhold his approval even when he finds an agreement with the Income-tax Officer that the conditions prescribed by the opening words of sub-section (1) exist.

(iv) As regards the concession made in the second proviso to clause (1) of the Section regarding a further declaration of dividend to cover the deficiency over 55 per cent. of the dividend, the Committee would suggest that the concession should be allowed where a dividend of at least 50 per cent. has been declared.

(v) The Committee would further suggest that the first proviso to Clause (1) of the Section should be deleted in order that a Company may build up a reserve with a view to secure a sound financial footing.

(vi) The Committee are also of opinion that, where the Tax is recoverable from a Company under Section 23(A) (3), the amount of liability may be reduced by the amount of the tax for which no credit is given in the assessment of the shareholders. In other words, where total effect has not been given of the application of Section 23(A) in the assessment of all the shareholders but it has been considered in the case of few shareholders only, by whom the tax is payable, then the amount representing the tax borne by the Company which has not been considered in the assessment of such shareholders should be deducted from the amount of the tax payable by the Company.

Question 84

No.

The Committee consider it reasonable to afford some relief to the shareholders from payment of Super-tax in respect of income received as dividend which has been already subjected to Corporation Tax in the hands of a payer Company. As shareholders are quasi-proprietors of a company and as net dividend is paid to them only after the tax is paid by the Company, it is not fair to levy the same nature of tax once in the hands of the Company and again in the hands of the recipient shareholders. It is, therefore, suggested that the treatment accorded to the levy of Super-tax in the hands of a shareholder should be the same as to Income-tax paid by them. In other words, the Corporation Tax suffered by the amount of dividend should be taken into account in levying Super-tax from shareholders from such dividend, the credit being given at the average rate of Super-tax chargeable or at the rate at which the dividend has suffered Corporation tax, whichever is lower.

Question 85

Yes.

The principle has been accepted universally that industrial, commercial and similar other enterprises undertaken by the Government and local bodies should be run on sound commercial lines and even, in those cases where there is no competition between private and public enterprises, the latter should be required to contribute from their earnings to general revenues an amount that would be payable by way of income-tax as if they were private concerns.

EVASION AND AVOIDANCE OF TAX

Question 86

A. The Committee agree that the services of Chartered Accountants should be utilised to a larger extent than at present for assisting in the determination of the taxable income of assessees. The form of the certificate laid down by the Indian Companies Act may be suitable from the point of view of the shareholders but may not quite serve the purpose of determining the taxable income. The Committee would, therefore, suggest that a form of certificate about the correctness of the computation of income shown in the return under the provisions of the Income-Tax Act may be laid down for the purpose.

B. A Chartered Accountant issuing a certificate referred to above will necessarily have to assume responsibility for the correctness of the Statement made therein.

C. The Committee agree that the certificate of a Chartered Accountant on the lines stated above should invariably accompany the return for business income over a certain limit and that the form of the certificate that may be prescribed for the purpose should indicate the scope of the check exercised by the Chartered Accountant.

D. The suggestions made above are subject to the fundamental condition that all such certificates should be accepted by the Income-tax Officers and that the assessee will be spared unnecessary harassment.

E. The Committee agree that fees payable by the Assessee to the Chartered Accountants for the certificates referred to above should be restricted to a schedule prescribed by the Government, unless otherwise agreed to between the parties themselves.

Question 87

The Committee have no suggestion to make.

Question 88

The Committee do not consider that the publication of the names of the persons who are penalised for con-

cealment of income will serve any useful purpose. They would, however, suggest that, subject to the right of the persons penalised having the right of appeal against the penalty to the High Court, they may be disqualified to hold positions of trust or membership of legislative or local bodies for convictions under Section 52 of the Income-tax Act.

Question 89

The Committee do not consider that the present practice of excluding from taxable profits perquisites given to employees of business undertakings results in a considerable loss of revenue. These perquisites are in the form of (a) house-rent allowance, (b) refreshments and tiffins, (c) entertainment allowance, (d) travelling allowance, and (e) conveying allowance, etc.

The Committee are of opinion that, except in the case of (a) where 10 per cent. of the salary may be included in the total income, no notice should be taken of other allowances. In any case, the principle which should be followed in this respect is that the perquisites should be allowed to the extent to which such expenses are reasonable, provided the amount disallowed, if any, is assessed in the hands of the recipient and is allowed as expenditure in the hands of employer. If necessary, a maximum limit of the amount to be so allowed may be fixed.

Question 90

Payment of taxes in the case of a Company under liquidation should have a prior charge.

Question 91

A. Already very large powers are conferred on Income-tax authorities and the Committee strongly oppose the conferment of larger powers.

B. The Committee are strongly opposed to any power being given to the Income-tax authorities to search premises and seize documents and books of accounts. Any power that may be given to the Income-tax Officers or their superior Officers to enter the building or the place of an assessee smacks of more than police powers, and is bound to undermine the credit and prestige of the assessee and harm their business interests. As for books, even now assessee are bound to produce them whenever called upon to do so by the Income-tax Officers, and it is not understood what further power is suggested to be given to the Officers. The Committee are in any case strongly opposed to a suggestion which was made in 1951 to give power to the Income-tax authorities to impound and retain in their custody books of account of any assessee.

Question 92

The Committee are against any penalty rates being imposed to minimise the avoidance of a higher rate resorted to by an assessee, keeping in conformity with the provisions of the Income-Tax Act. No step should be taken against any legal avoidance of taxes.

RECOVERY

Question 93

The recovery of outstanding tax of any partner of a registered firm should be made from the firm itself. In case, however, it is not possible to do so, such recovery should be made from the partners limited to the extent of their drawings.

Question 94

The present arrangements relating to recovery of Income-tax are, in the opinion of the Committee, adequate. They would, however, suggest that the Income-tax Department should have a Departmental machinery for enforcing the recovery of arrears of tax. It will avoid a lot of troubles and inconveniences if the machinery is run by the Department, and the recovery is not enforced through the Certificate Department, as at present.

Question 95

In the case of a Private Limited Company, there are shareholders who do not take active part in the management and any liability for the payment of the tax should, therefore, be imposed only on the Directors.

This suggestion is, however, subject to the observation made below.

There are bound to be hardships in collecting tax from a Private Limited Company in a year when due to losses incurred there may not be cash to pay the tax on profits of the previous year.

Question 96

Recovery proceedings should be instituted only after the judgment of the Tribunal.

GENERAL**Question 97**

(i) The Income-tax Department should have a separate Section to provide free advice to small assesseees on the points mentioned in the question.

(ii) Appointment of a Public Relations Officer may be helpful for providing information on various matters relating to assessment proceedings.

(iii) Income-tax Officers should appreciate that the time of the assesseees is valuable and they should try to expedite their cases as early as possible.

(iv) The Income-tax Officer should inform the assesseees beforehand of all the points that he would require for the purpose of assessment to his satisfaction. This procedure will bring all facts and relative documentary evidence in the surface.

Question 98

(i) All notice should be issued by Registered Post with Acknowledgement Due.

(ii) Different forms may be prescribed for different classes of assesseees, particularly the salaried personnel and owners of house property, the assesseees being required to declare that they have no other income.

(iii) Present arrangements should be continued except that the Income-tax Officers should not be authorised to impose penalty.

(iv) As regards recovery of tax, please refer to the replies in answer to Question 94.

(v) The position of Appellate Assistant Commissioners is rather anomalous at present. Even though they are appointed by the Central Government, they are under the administrative control and jurisdiction of the Commissioners and the Central Board of Revenue. The Commercial Community have all along urged that the Appellate Assistant Commissioners should, in view of the special functions they perform, be placed under the Ministry of Law. But this proposal has not so far been agreed to by the Government. The proviso to Section 5(8), which provides that the Central Board of Revenue shall not issue any orders, instructions or directions to the Appellate Assistant Commissioners so as to interfere with their discretion in the exercise of their appellate powers, does not, in actual practice, ensure the independence of the latter. The fact remains that, being under the administrative control of the Commissioners, and subject to the orders of the latter in respect of their leave, transfer, postings and promotions, they are not always in a position to take an independent line in the exercise of their appellate functions.

Reference may, in this connection, be made to the Recommendation (No. 149) of the Investigation Commission that the Appellate Assistant Commissioners should be removed from the control of the Commissioners and the Central Board of Revenue, and should be placed under the Appellate Tribunal and further that their leave, transfer and postings should be in the hands of the Tribunal.

The Commission also examined the suggestion that the Appellate Assistant Commissioners should be recruited from among the senior subordinate judges and, while they drew attention to the fact that the nature of the work requires an intimate knowledge of income-tax work which a purely judicial officer is not ordinarily expected to acquire even after a brief period of special training, they did not throw out the suggestion entirely and had, in fact, suggested that an experiment should be tried in a few instances, if there was no other difficulty in the way of doing so.

The Commission further suggested (Recommendation No. 150) that the normal avenue of promotion for Appellate Assistant Commissioners should be the Appellate Tribunal and further that, if it were not possible to afford reasonable prospects of promotion to all the Appellate Assistant Commissioners, a few posts in the grade of Appellate Assistant Commissioners carrying a salary approximating to that of Commissioners of Income-tax should be created. The idea which the Commission had evidently in view was to make the Appellate Assistant Commissioners completely free from any administrative control and functional interference of the Department. Unfortunately, this recommendation has not been accepted by the Government.

On their part, the Committee fully endorse the views of the Commission and would recommend that the Appellate Assistant Commissioners should be appointed by

the Ministry of Law and should be under the administrative control and jurisdiction of the latter.

It is further necessary that their designation should be such as not to imply their subordination to the Commissioners. The Committee would suggest, for consideration by the Government, the designation of "Appellate Commissioners" being conferred on them.

Question 99

(a) Yes.

The delay is due partly to the dilatoriness on the part of the officers.

(b) The Committee would suggest that a system of rebate granted in case of prompt payment of the tax would lead to speedy collection of a substantial portion of the tax.

SPECIAL BUSINESS TAX**Question 100**

The Committee do not consider that, having regard to the existing circumstances of Indian economy, the imposition of excess profit tax or special business taxes would be justified.

DEATH DUTY**Question 101**

The Estate Duty Bill has now been passed into a law, and though the provisions of the Act are in some respects better than those originally proposed by the Government, the Committee believe that the present time was not opportune for imposing a tax on estates passing on the death of a person. They would, however, prefer not to make any observation at present on the matter and would like to watch the effects thereof on the economy of the country.

Question 102

Yes.

PART III.—COMMODITY TAXES (CENTRAL AND STATE).**CUSTOMS****IMPORT DUTIES****Question 103**

(i) and (ii) In the first schedule to the Indian Customs Tariff, namely Import Tariffs, commodities have been grouped into 22 broad sections and goods coming under each section have again been classified under various items, the total number of broad items being only 87. On the other hand, in the Import Trade Control Schedule, goods have been classified under about 600 items in six parts for the purpose of licensing of imports. While the grouping under Import Control Schedule cannot by any means be said to be logical and rational and is undoubtedly open to revision, the Committee believe that the said Schedule in detail is more scientific, having been governed by the two-fold consideration of availability or otherwise within the country of the commodities and their end-use. On the other hand, the Indian Customs Tariff Schedule was originally prepared at a time when industrial development in the country had not progressed on such a large scale as at present, and periodical additions or alterations which have since been made mostly on *ad hoc* basis have not been of general help. Naturally the Tariff has not been as scientific or elaborate as should be and this has led to confusion in the matter of classification and assessment of duties.

The Committee feel that the Import Tariff needs general overhauling to suit modern-day conditions of trade and the progressive industrialisation of the country, due account being taken at the same time of the end-use of the goods concerned either as raw materials or as finished goods.

The latest International document about Customs Tariffs is the Tariff Nomenclature prepared for Customs Purposes by the European Customs Union Study Group (*vide* Standard International Trade Classification—United Nations Statistical Office Statistical Papers series M. No. 10—second edition—New York, June 1951). While the 22 sections in the Indian Tariff are undoubtedly based on accepted international standard, there is a considerable divergence in matter of details under each section. It is true that all the details in the latest International document may not be suited to or required for Indian conditions, but a close study of this document, having due regard to our peculiar circumstances, may be of assistance in bringing the Indian Tariff to a more stable and scientific basis.

For their part, the Committee would like to make a few suggestions about the re-grouping and re-classification of certain commodities as follows:—

Item.	Present ICT No.	Proposed ICT No.	Remarks.
Coloured and Copying Pencils.	45(4)	30(7).—Lead Pencils'	Copying and coloured pencils are as much pencils as lead pencils and there is no reason why these items should be included in a classification other than that of lead pencils. It is, therefore, suggested that coloured and copying pencils should be grouped together with lead pencils under a broad heading 'Pencils' falling under the existing I.C.T. Items No. 30(7). It need hardly be stressed that, in revising the tariff classification of the articles, the prevailing differential rate of customs duties, which are protective, should be retained.
Pencil Lead (Pencil slip)	45(a).—Stationery N.O.S.	30(7).—Lead Pencils	Pencil lead or pencil slip is a major manufactured part of "lead pencils". The item should, therefore, be classed with or without a separate heading under the general item "lead pencils" and should be charged the same rate of duty as the latter goods.
Gold or Gold plated nibs and clips.	61(7)	45(a).—Stationery N.O.S.	The revision in the existing customs classification of gold or gold plated nibs & clips is warranted by the fact that they constitute essential accessories of fountain pens and the lower rate of duty applicable to stationery N.O.S., should be extended in their case.
Pins Stapling Machine	71.—Hardware, Iron-mangery & tools, all sorts, N.O.S.	45(a)	These are the items which are exclusively dealt in by stationers and should, therefore, be covered under the sub-heading 'Stationery all sorts N.O.S.' and the rate of duty applicable to the latter category of goods should be extended in these cases.
Ferro-Prussiate and other sensitised paper.	77(5).—Photographic, instruments, apparatus & appliances.	45(a)	
Paper Perforating Machines.	77.—Instruments, apparatus and appliances other than electrical, all sorts, N.O.S.	45(a)	
Patchouly leaves, Rose Flowers, dried Ambergrics, Absolutes, Concretes, etc.	31(5).—Perfumery not otherwise specified.	Should be classified under a separate item.	These materials are not perfumery as such, but industrial raw materials for the perfumery industry.
Methyl Propyl and Iso-Propyl Alcohol.	22(4).—Spirits other than Denatured Spirits.	28.—Chemicals	These alcohols are non-edible spirits required generally for industrial purpose and should, therefore, be classified as chemicals.
Paper for Sensitising Stereo, Litho, etc.	44	Separate classification is suggested.	These are essential raw materials for certain local industries and as such should be classified separately from writing and printing paper.
Casein	87.—All other articles not otherwise specified.	Should be included as a special item.	Assessment of Casein under item No. 87 might have been justified at a time when imports were on a very small scale. But now that Casein is being imported on a large scale for use by the well-developed local Plywood industry, it is desirable that Casein, the raw material for the Plywood industry, should be separately classified.
Aeromatic Chemicals	28.—Chemicals, Drugs & Medicines N.C.S.	Should be separately classified.	Aromatic Chemicals which are raw materials for some indigenous industries are imported into the country in large quantities, and should, therefore, be separately classified.
Synthetic Essential Oil	31(3)	Should be classified with item No. 31(5).—Perfumery not otherwise specified.	With a few exceptions, the products classified under "synthetic essential oils" are perfumery compounds and should, therefore, be brought under item No. 31(5) 'Perfumery not otherwise specified'.

The Committee would further draw attention to the fact that the item 87 in section XXII of the Tariff embraces a wide range of articles from raw materials for industries, gases, chemicals, etc., to finished products. Such a position is hardly defensible and a greater clarity and classification of goods sectionwise is desirable.

(iii) The revision and re-classification of the I.T.C. Schedule had recently formed the subject of an enquiry by Sri P. M. Mukherji, formerly Director General of Commercial Intelligence and Statistics, who was appointed by the Government of India as an Officer on Special Duty for the purpose from July 1952 to March 1953. In the course of his examination of the problem, Sri Mukherji had prepared and circulated drafts of a revised Import Trade Control Schedule in the light of the suggestions received from various Chambers of Commerce and Trade Associations. This draft was examined by the commercial interest, including the Chamber,

who duly submitted their comments on the proposals contained therein, and the Committee of the Chamber had also had an opportunity of holding discussions with Sri Mukherji at Calcutta. In course of discussions, Sri Mukherji had stated that, in the final scheme which he would submit to the Government, it was his intention to add, apart from a revised draft of the I.T.C. Schedule, a separate statement showing the co-relation of the items in the revised I.T.C. Schedule with the items in the Indian Customs ariff as well as a tentative draft manual giving the illustrations of articles or groups of articles which fall within, or are excluded from the scope of an item in the revised Schedule and also mentioning the items about which difficulties of classification might have been experienced in the course of the working of the Import Trade Control. Sri Mukherji's final Report has not as yet been published by Government but will probably be made available to the Commission, who will undoubtedly take into consideration the recommendations made by him. In any case, the

Committee would suggest that action should be taken to bring about, among others, a proper co-relation between the Indian Customs Tariff Schedule and the Import Trade Control Schedule and that arrangements should exist for proper revision of the co-relation statement from time to time so that the trade continues to receive adequate guidance.

The Committee would also draw attention to the need for removing the anomalies arising out of the imposition of certain conditions in respect of imported chemicals, drugs and medicines. While the Import Licensing Authorities have laid down no packing conditions for these articles, the Customs Authorities at the Calcutta Port have imposed certain restrictions in this regard leading to wrong classification and assessment of the commodities concerned, and difficulties in clearing them. Greater liaison between Import Trade Control and Customs is required in this matter.

Mention may in particular be made of the following instances :—

- (a) *Benzyl Benzoate, Sodium Benzoate, Balsam Tolu, Calcium Gluconate, Citric Acid, Sodium Salicylate, Salicylic Acid, etc.*

These items may be treated both as chemicals (I.T.C. Sl. Nos. 22, 29, 31, etc., of Part V) or as medicines (I.T.C. Sl. No. 109 of Part IV). The usual practice of the Customs is, however, to classify these as 'Chemicals' when imported in bulk and as 'medicines' when imported in small packings, and assess duty accordingly, [cf. I.C.T. items 23 to 28 (29)], though their limit of 'Small' and 'bulk' packings is seldom publicly announced. It is likely that some trade practice is being followed in these matters but it is necessary that Government should make clear the *raison d'être* behind their action and issue a public notification defining the position about packing in respect of items concerned. In the absence of clear-cut definitions and distinctions, the Customs Authorities should allow the clearance of goods concerned under licences for 'Chemicals' as well as for 'Medicines'.

(b) *Olive Oil*

This item is classified by the Customs Authorities as 'Vegetable non-essential Oils', I.T.C. Sl. No. 61, Part IV, and I.C.T. item No. 15(6), in bulk packings, and as 'medicine' I.T.C. Sl. No. 109 Part IV and I.C.T. item No. 28, when imported in small packings of not more than 1 gallon. As overseas suppliers sometimes offer Olive Oil in packing of 1 gallon or less either because Olive Oil in packing of more than 1 gallon is not in their stock, or because Olive Oil imported in small packing may be had for immediate delivery, it is suggested that Olive Oil should be classified by the Customs under one heading, viz., 'Vegetable Non-essential Oil'.

(c) *Adeps Lanae B.P.*

Adeps Lanae B. P. is classified as medicine under I.T.C. Sl. No. 109, Part IV, while the Customs classify the article when in packing of more than 1 lb., under "all sorts of animal fat, not otherwise specified", I.C.T. item No. 15, and subject it to a duty of 31½ per cent. *ad valorem*, as against a duty of 27·3 per cent. on medicines, I.C.T. item No. 28. There is no justification for classifying *Adeps Lanae* packed in bulk separately and assessing the same to the higher rate of duty. If, however, any differentiation is at all to be made, *Adeps Lanae B. P.* in whatever packing should be classified as drugs and medicines under I.C.T. No. 28, and *Adeps Lanae* of commercial quality in whatever packing should be classified as 'all sorts of animal fats not otherwise specified' under I.C.T. item No. 15.

The aforesaid suggestions, among others were submitted to Sri P. M. Mukherji who was examining the matter of revision of the I.T.C. Schedule and it is hoped the Commission will also give sympathetic consideration to them.

(iv) There are a number of items in the I.T.C. Schedule and the I.C.T. Schedule which are not clearly defined. Mention may, in particular, be made of Essential Oils, both Natural and Synthetic, and Aromatic chemicals. As a result, these items are frequently wrongly classified by the Customs leading to difficulties in the matter of the clearance of the goods from the Port and correct assessment to duty on the same.

The Committee would therefore suggest that these items should be clearly defined as under:—

- (i) *Natural Essential Oil* : I.T.C. Sl. Nos. 127-129, Pt. IV & I.C.T. Item Nos. 31, 31 (1) and 31 (2).

Natural Essential Oils are steam volatile substance obtained from odorous parts of natural plants, flowers, herbs, roots, balsams, gums, fruits etc., without addition of any chemical or synthetic oils.

- (ii) *Synthetic Essential Oils* : I.T.C. Sl. No. 130, Part IV and I.C.T. Item No. 31(3).

Synthetic Essential Oils are mixture of various chemicals, mainly odorous, with or without

the addition of Natural Essential Oils, blended together judiciously to give a suitable perfume for use in the preparation of toilet products. These may be liquid or viscous.

- (iii) *Aromatic Chemicals* : Classified under I.T.C. Sl. No. 12, Pt. V & I.C.T. Item No. 28.

Aromatic Chemicals are pure chemicals, liquid or solid, having a definite formula and composition mostly with an aroma and mainly used as components of synthetic essential oils, perfumes and in the preparation of toilet products. Also used in medicines, viz., Benzyl, Benzonate, Menthol, Methyl Salicylate, etc.

(iv) *Resinoids.*

This is now classified as 'Perfumery not otherwise specified' under I.T.C. Serial No. 132 of Part IV & I.C.T. Item No. 31(5). As, however, "Resinoids" is not strictly an item of perfumery but is a perfumery raw material, it should be classified under a separate heading.

(v) *Laboratory Chemicals.*

At present this item is classified under 'Chemicals not otherwise specified' (I.T.C. Sl. No. 12 Part V). There is, however, no clear-cut definition of the said term, resulting in difficulties to the importers. An attempt has been made under the I.T.C. regulations to throw some light inasmuch as it has been laid down that imports of what categories of goods will not be valid under licences issued for laboratory and reagent chemicals. This is not, however, adequate, and it is suggested that both for Customs and Import Trade Control purposes, the term 'Laboratory Chemicals' should be clearly defined and it should also cover items like Pulv Rhei, Albumen from Eggs, Santonin, etc., which may be required in laboratories for research and experimental purposes, but are nonetheless classified by the Customs as medicines.

- (vi) As the definition of 'Natural Essential Oils' as given above, does not cover three other classes of important perfumery raw materials, viz.,

- (a) Balsams and aromatic gums,
(b) Resinoids and Resinogums, and
(c) Concretes and Absolutes,

the definitions for these products should be as under:—

- (a) *Balsams and Aromatic Gums*.—These products are aromatic exudations obtained from certain trees.
(b) *Resinoids and Resinogums*.—Products obtained from various parts of plants excluding flowers by means of solvents—Benzene Toluence, Petroleum, Ether, Alcohol.

Question 104

(i) While generally rates of import duties should be fixed for different groups or sub-groups of commodities mainly with the object of earning revenue, the following considerations should also be taken into account in fixing the rates:—

- (a) In regard to those industries which are protected, the rates should admittedly be those which are recommended by the Tariff Commission.
(b) The rates of duties on raw materials, stores, plants and machinery which are not available within the country should be fixed as low as possible in order to enable the consuming industries to compete with types of imported goods manufactured by those industries.
(c) The indigenous industries, which have to compete with foreign rivals in export markets in respect of their finished products, should be refunded the entire amount of duty paid by them on imported raw materials, subject to satisfactory safeguards in the application of the formula.
(d) The rates of duties on essential articles of consumption, particularly those used by poorer sections of the community, should be fixed at as low a level as possible, consistent with the revenue requirements of the Government.

- (e) In regard to the rates of duties on any commodity, whether finished or raw materials, the Government should necessarily examine the incidence of these duties and whether the rates are high resulting in diminishing returns.

(ii) **A. Raw Materials**

The attention of the Committee has been drawn to the cases of the following raw materials, the high rates of duties on which bear heavily on the industries in which they are processed:—

- (a) Casein, (b) Soda Ash, (c) Borax, (d) Alloy Steel, (e) Carbon (black), (f) Fatty Acid and Heavy Fatty Acid, (g) Gas-filled Cylinders, (h) Methyl and Ice Propyl Alcohols, (i) Raw Materials for perfumery industry, (j) Beechwood for Card Staves, (k) Coconut Oil, (l) Natural Essential Oils, (m) Vitamins, (n) Raw materials for the Refrigerator Industry and (o) Gold or Gold-plated Nibs and Clips.

There is strong case for the reduction in the rates of duties on all these items.

References to the last three items mentioned above are being made in reply to Question 104(iv), and a short explanatory note on the other items is appended as Annexure I.

In addition, the question of adjusting the duties on the items mentioned in reply to Q. 103 as a result of their re-classification should also receive careful consideration.

B. Finished Goods

There can be no doubt that the existing rates of customs duties on the import of some of the finished goods bear heavily on the consumers. The rates have been increased from time to time by the Government to cover their revenue needs and a full examination could not naturally be made of the probable effects thereof on the consumers. On the other hand, the increase in some of these duties at least has had the effect of giving an indirect protection to the indigenous industries manufacturing the goods concerned and the question as to whether and, if so, to what extent these duties should be reduced has to be considered very carefully. The case of paper and paper products has, in this connection, been brought to the attention of the Committee. It has been stated that paper being an article of common use and required, *inter alia* for educational purposes, the import duty thereon should be as low as possible. At the same time in considering any such reduction in import duty its effect on the Paper Manufacturing Industry in this country will have to be taken into account.

There may be many other commodities in respect of which similar observations may be made.

- (iii) The Committee received complaints about smuggling of goods from foreign countries, particularly from Pakistan, mainly with the object of evading payment of high rates of import duties. But, in their opinion, the question is one of administrative arrangements rather than of reduction of duty in respect of any specific commodity. Moreover, any reduced duty will have to be of general application and under India's international obligations cannot be applied to goods of Pakistani origin only.

- (iv) The following cases of higher import duties on the constituent parts than on finished products have been reported to the Chamber:—

(a) **Resinoids—**

While the duty on resinoids, which is classed as "Perfumery", I.C.T. item No. 31(5), is assessed at 66½ per cent. *ad valorem*, that on some of the finished products, in which Resinoids are used as ingredients, are assessed at 37½ per cent. under I.C.T. item No. 28(14).

(b) **Vitamins—**

Vitamin preparations are assessed to a duty of 20 per cent. *ad valorem* under I.C.T. item No. 28(29), but the duty on Vitamine is assessed at a higher rate under I.C.T. item Nos. 28 & 28(21).

(c) **Raw Materials for Refrigerator Industry—**

The Refrigerator Industry has to pay duties ranging from 30 to 36 per cent. *ad valorem* on its imported raw materials such as, refrigerant gas, copper tubes, paints for finisheg, etc., even though the import duty on a completed refrigerator is only 24 per cent. *ad valorem*. As a result, the competitive position of the indigenous refrigerator industry *vis-a-vis* the foreign industry is greatly weakened.

(d) **Gold or Gold-plated Nibs and Clips**

The indigenous Fountain Pen Industry has been experiencing great difficulties on account of the heavy duties on imported essential accessories, *viz.*,

Gold or Gold-plated Nibs and Clips. At present, these items are being assessed to a duty of 66½ per cent. *ad valorem* even though Fountain pens complete are subjected to a duty of only 30 per cent. *ad valorem*.

With a view to give relief to the indigenous industries mentioned above, it is necessary that a parity should be maintained between the import duties on the essential raw materials and those on the finished goods in which they are used.

- (v) The Committee believe that there may be cases where owing to high rates of duties the yield has reached the point of diminishing returns but, in the absence of necessary statistics, it is not possible for any non-official organisation like the Chamber to make any categorical statement on this point. The Commission may, however, be able to secure necessary information in this regard from the Government of India themselves. Even the latter will not possibly be able to arrive at a definite finding in the absence of any reliable record of the course of trade over a series of normal years. The abnormal years of the war have been followed by a period of great foreign exchange difficulties necessitating imposition of great restrictions on imports, and it is difficult to isolate the incidence of the duties on the volume of the trade.

It has, however, been brought to the notice of the Committee that in some cases import licences granted by Import Trade Control have not been utilized or only partially utilized because of the apprehension of the importers about the inability of the market to absorb the imported goods concerned at current market prices. It is possible that, in several of these cases, details of which may be had from the Import Trade Control authorities, the comparatively high prices of the imported goods were accounted for by the prevailing high rates of customs duties.

Question 105

As already stated in the preliminary Memorandum of the Chamber, in a period of rising prices, *ad valorem* duties lead to correspondingly high prices of the imported goods, the increase over the c.i.f. prices being similarly smaller in a regime of falling prices. Apart from the purely budgetary considerations, *ad valorem* duties have definitely a tendency towards accentuating the inflationary effects in period of rising prices and, subject to their suitability in a scheme for Tariff Protection, may also retard capital formation by reducing the margin of saving and the amount available for investment. A specific duty, on the other hand, does not influence the cost of imported goods to the same extent and may be welcomed by the consumers in a period of rising prices.

Considering all the aspects of the matter, it is desirable that specific duty should preferably be replaced by *ad valorem* duties for two reasons:—

Firstly, in the Indian Customs Tariff only some items are subjected to specific duty and in the majority of even such cases, provision has been made for assessment of *ad valorem* duty in the alternative, if it is higher than the specific duty.

Secondly, specific duties, if they are to be fair, should involve differentiation of different grades of the commodities which is not always possible.

It is true that, in the case of specific duties, the scope for friction between the importers and the assessing staff on the question of the adequacy of the declared price is much smaller; but if, as has subsequently been suggested in answer to question No. 106, the invoice values of the goods imported are accepted by the Customs, there should not be any difficulty in the application of the *ad valorem* duties.

Question 106

(i), (ii) and (iii). From complaints which have been received by the Chamber, it appears that tariff values are not generally satisfactory basis for assessment of import duties. The tariff values are determined by the Government on the basis of the ex-duty average wholesale monthly market prices at the main importing centres in India during the 12 months ending June, each weighed by the relative importance of the trade in each particular article at each of the principal importing centres, and modified when necessary in the light of proposals made by the various Collectors of Customs and Central Excise authorities in India and also having regard to the probable future trend in prices. The tariff values at the provisional stage are of course discussed with the representatives of important commercial bodies before being finalised, but the values have usually been fixed by the Government at a higher level than what is considered fair and just by the trade. The differences of opinion between the Commercial Bodies and the Government on the question of fixation of tariff values arise out of the fact that the former do not always agree on the basis of the information available

with them, with the basic data and other subjective considerations on the basis of which the Government fix the tariff values.

The Committee do not deny that the incidence of tariff values is like that of specific duties and that if a greater measure of co-ordination and liaison could be established between Government and the trade in the matter of fixation of these values, the existing system might be maintained in respect of a few specified commodities, determined beforehand in consultation with the trade.

As, however, these conditions may not always be easily satisfied, and to avoid these complications, the Committee would suggest that, as in the majority of the cases of the imported goods, the value of the goods, declared in the Invoices, supported by documents, should be accepted by the Customs authorities, for the purpose of applying the *ad valorem* duty.

Question 107

(i) and (ii). The observations made in reply to Question No. 106 apply equally to this question. The assessment should normally be on the price at which goods of like kind and quality can be delivered, that is invoice price to which cost of freight may be added if not already done and, only if there is reason to suspect that the invoice is not genuine, should the duty be assessed on the wholesale cash price less trade discounts and import duties.

Question 108

The Committee are in favour of granting exemptions from or reductions in import duties in regard to all the items mentioned in the question, subject to the need for development of indigenous industries and to the adoption of due safeguards for preventing abuse of concessions.

Question 109

The Committee are in favour of bi-lateral fiscal arrangements with different countries, whether within the Commonwealth or not, provided—

in the first place, preferences given by India to the exports from particular countries actually result in a corresponding increased off-take of Indian goods in those countries, and

secondly, by such mutual trade pacts India does not antagonise other countries which might be in a position to offer larger and more abiding markets for Indian goods than within the country with which bi-lateral trade pacts are being entered into.

Question 110

Members of the Chamber have expressed different views in regard to the issues raised in this question.

There is a certain section which prefers the imposition of high customs duties to the fixation of import quotas as a means of restricting imports. The main argument which they put forward in support of their views is that the high tariff wall thus erected would adequately protect indigenous industries from unequal and sometimes unfair competition from abroad. They also seem to think that a system of import quota, without high rates of duties, permitting the import of howsoever smaller quantity of goods from foreign countries at comparatively low prices, might disturb the market structure within the country in such a way as to compel the indigenous industries to sell their products sometimes even below cost. A further point is the general objection to control as such. Though during the last few years some of the undesirable features of Import Trade Control have been gradually removed, no system can in fact be evolved which can be free from objectionable features. Besides, a system of Control cannot be a permanent feature of any economy.

On the other hand, there are those who believe that the high rates of duties are not always effective in preventing the import of goods from foreign countries, and the lurking prejudice still unfortunately existing amongst consumers in India against Indian goods sometimes makes it possible for imported goods to be sold in the market even at higher prices. The fixation of an import quota would, however, restrict the total quantity of imported goods thus available for consumption by consumers having preference for the same. As a matter of fact, the Government of India have also accepted the policy of quantitative restrictions of imports for giving protection to the indigenous industries concerned, apart from any consideration to the need for conservation of foreign exchange of the country.

The Committee consider that these views can be harmonised, and the application of one or other will depend largely on the circumstances of each case, having regard to the nature of goods, their vulnerability to competition and their popularity, etc.

Question 111

The Committee feel that full facilities should be afforded to indigenous industries using imported materials and exporting finished products abroad to obtain refund or draw back of duty paid on those materials. While they do not deny the need for taking adequate steps to safeguard the revenue interests of the Government, they are at the same time of opinion that the industries concerned should not be required to fulfil any harassing procedure, so as to nullify the benefit of concessions granted.

Question 112

For settlement of disputes arising out of appraisal, Arbitration Boards should be formed at each Port with, among others, the representatives of the Chambers of Commerce and Trade Associations concerned.

Further, the procedure relating to appeals against penalties imposed under the Sea and Land Customs Acts, should be analogous to that under the Indian Income-tax.

According to Section 40 of the Sea Customs Act, no refund of charge erroneously levied or paid is made unless the claim is made within 3 months from the date of payment. This time limit is too short to enable the importers to contact their overseas suppliers, which is so often necessary, and to make their papers ready for the purpose of filing the claim. In view of this and also in view of the fact that there is no time bar for the Government in making any claim on parties, the Committee would suggest that at least 6 months' time, as in the case of claims against the Railways for refunds of dues, should be allowed to the assessee for filing their Customs claims.

EXPORT DUTIES

Question 113

The main considerations which should govern the imposition of export duties are as follows:—

- whether the particular trade or industry can bear the burden in meeting competition in foreign countries from other alternative sources,
- whether it is desirable or necessary to discourage the export of particular articles to foreign countries having regard to the need for conserving the supplies within the country,
- whether the commodity, subjected to duty, is a monopoly product of the country or whether this country is the major supplier of the articles,
- whether the exportable item is a raw material for the industries of other countries which are carrying on keen competition with the local industries in the foreign markets.

Where the conditions (c) and (d) are both satisfied, there may be a strong case for imposition of export duty both for earning revenue and to give protection to the indigenous industries—concerned. A short note on the incidence of the export duties on various articles in the light of the above considerations is appended as Annexure II.

Question 114

When the Indian Tariff Act, 1934, was first enacted, export duties were enforced only on four commodities. Since then, considerable additions have been made to the list and modifications made in respect of the rates of duties. The list now includes as many as 16 items.

Some of these duties were imposed by Amendments of the Indian Tariff Act, 1934, while in respect of a few others resort has been taken to the powers conferred upon the Government to levy or increase export duties by Section 4A inserted into the Indian Tariff Act by an amendment in December, 1950. While this amend Act provided that any Notification issued thereunder would cease to have effect on the 1st March 1952, a subsequent amendment made in July 1952 has removed this time-limit and any Notification, made under Section 4A which may be approved by Parliament, may now be rescinded by the Central Government at any time by Notification in the Official Gazette. Reference may, in this connection, be also made to Section 23 of the Sea Customs Act, 1878, which empowers the Central Government to exempt, by Notification in the Official Gazette, any goods, imported into or exported from India or into or from any specific part therein, from the whole or any part of the Customs duties leviable on such goods.

It is, therefore, clear that, subject to the subsequent approval by Parliament of any action taken by the Government in imposing a new export duty or increasing the rate of duty, the Government have undisputed right to impose, increase or abolish export duties on any particular commodity. Undoubtedly, such a provision

imparts an element of elasticity to the export duties, conditions regarding the application of which are subject to frequent changes in the light of altered international market. The Committee are conscious of the objections made in certain quarters to the grant of any such powers to the Government on the ground that representatives of the people in Parliament may not have an opportunity of examining the desirability of the action proposed to be taken by the Government. While not questioning the validity of this objection, the Committee would point out that international conditions change so rapidly that the time taken in obtaining the prior approval of Parliament may sometimes prevent immediate action being taken by the Government to suit the altered situation in the export markets. Provision should, however, be made for obtaining the approval of Parliament as soon as possible after the duties are varied by executive action.

On the other hand, the Committee are not aware whether there is any administrative machinery which watches and scrutinises carefully the effects of these duties on the various industries and trade and on the extent to which the sale of Indian goods is affected thereby; and the competitive position of Indian industries in foreign markets is reduced as a result of the export duties. As they have explained in Annexure II, the present system is not working quite satisfactorily. The inordinate delay made by the Government in reducing the export duties on certain commodities and the refusal by them to take any action in respect of some others would suggest the need for devising a more suitable machinery for the purpose.

Question 115

At present cesses are imposed on the export of certain commodities with the object of utilising the proceeds thereof for promoting the export trade of the particular commodities concerned as well as for purpose of internal research and development of the goods. Mention may, in particular, be made of the cess imposed on export of Tea. By the very nature of things, the rates of these cesses are much lower than the export duties and do not generally have much effect in increasing the prices of the goods in the export market. The Committee are not in favour of the proceeds of the export duties, as distinguished from cesses, being funded for financing schemes for promoting long range development of the export trade, the necessary expenditure should be met out of general revenues.

Question 116

No.

Central Excises

Questions 117 & 118

A. As was stated in the Preliminary Memorandum submitted by the Committee, excise duties are generally not welcomed in view of their incidence on the prices of the commodities on which they are imposed. At the same time, the Committee feel that it may not be possible for the Government to forego the substantial revenue which they now earn from the Central Excise. In view of this, the Committee consider that the list of commodities on which duties are now imposed should be very carefully scrutinised and some of the commodities, at present subjected to duties, should be exempted from the list. The considerations which should weigh with the Government in this respect are stated below:—

In the first place, while the Committee believe that the industries which have been developed as a result of protection granted by the Government may, under certain conditions, be asked to bear the burden of excise duties, they are at the same time of opinion that those which are not so protected should generally be exempted from the payment of such duties. Even in respect of the former category of industries, care should be taken so as not to increase the burden on the consumers who, even otherwise, have to pay higher prices as a result of protection. On the other hand, the excise duties should not be so imposed as to counteract the benefits of protection to the industries concerned.

In the second place, the industries which manufacture essential consumer goods should generally be exempted from the payment of duties.

In the third place, there are industries which may, in prosperous times, absorb the incidence of the excise duties without either passing on the same to the consumers or incurring losses. At times of depression, however, these industries may not be able to pass on the tax to the consumers, either can they pay the same out of their profits and, consequently, have to suffer loss of markets or to sell their goods sometimes at losses. This consideration is particularly important in the case of industries having export markets.

It is, therefore, necessary that there should be some machinery according to which certain particular com-

modities may be exempted either wholly or partially from the payment of excise duties, even if on a temporary basis, whenever the situation so warrants:

B. Examining the present list of commodities, the Committee would in particular refer to the duties on Motor Spirit, Cotton Cloth, Tea and Vanaspati.

(i) Motor Spirit

As regards motor spirit, the Committee are of opinion that taxes on road transport should be as much liberalised as possible. Some of the existing taxes have been covered by the Taxation Enquiry Commission in Part V of their Questionnaire, and the detailed views of the Committee on the particular issues raised in these questions will be expressed in the appropriate place. But so far as excise duties on motor spirit are concerned, the Committee are definitely of opinion that motor spirit should be taken off the list, or at least the rate should be reduced to a reasonable level.

(ii) Cotton Goods

As regards cotton cloth, the Committee would draw attention to the fact that, while production has, in recent months, increased considerably and has almost reached the target fixed for 1955-56 under the Five-Year Plan, the industry is facing a very stiff consumers' resistance in the disposal of its products. Large stocks are reported to be accumulating either with the mills or with the dealers in spite of the fact that, considered from the point of view of per capita requirements, the industry cannot be said to have reached a stage of over-production. The reason for this paradox appears to lie in the too high prices of cloth compared to the purchasing power of the people. As in the case of many other industries, the Cotton Textile Industry suffers from a very high and rigid cost structure. There has actually been a very large increase in the prices of raw materials, stores, etc., on the one hand and wages on the other. An additional factor which has contributed to rise in prices is the excise duty which was imposed in 1949 and has since been gradually so stiffened as to account for as much 5 per cent. to 15 per cent. of the retail prices of the goods according to their different varieties.

The rates of duties which are imposed on the various kinds of cotton goods are mentioned below:—

Superfine cloth, i.e., cloth in which the count of warp yarn is 48 s or finer . . .	Re. 0-3-3 per yard.
Fine cloth, i.e., cloth in which the count of warp yarn is 35 s or finer but does not exceed 47 s . . .	Re. 0-1-3 per yard.
Medium and coarse cloth, that is to say, in which the count of warp yarn does not exceed 34 s . . .	Re. 0-0-3 per yard.

Besides, an additional excise duty at the rate of 3 pies per yard is leviable on all cloth under Section 3 of the Khadi & other Hand Loom Industries Development (Additional Excise Duty on Cloth) Act, 1953.

It is clearly not possible for the industry to make any reduction in the prices of raw material, wages, etc., over which it has no control, neither is there any scope for further minimising its profits, which are already too low. As a matter of fact, prices of goods, though comparatively high, have not risen proportionately to the increase in the costs. Even so, the present prices are much below those prevailing a few months ago, thus reducing the already narrow margin of profits, to the mills.

The only way left for bringing down to some extent the prices of cloth within the purchasing power of the people is thus to withdraw the excise duty.

There are two further points about the excise duties on cotton goods which may be mentioned here. In the first place, till recently, the duties on fine and superfine cloth were *ad valorem*, the rates being 5 per cent. and 20 per cent., respectively. The basis has, however, been changed with effect from the current financial year to specific duties as per Schedule referred to above. In justifying this change, the Finance Minister pleaded administrative convenience and did not expect any increase in the revenue. The Committee have no information as to the details of "the administrative difficulties and the continual friction between the mills and the assessing staff on the question of the adequacy of the declared prices", referred to by the Finance Minister, but they would point out that while, as a result of the change in the basis, the Government are actually earning larger revenues, the consumers are not getting the full benefit of the fall in the prices of goods.

Secondly, the Committee has strong objections to the imposition of an additional excise duty only with the objective of utilising the proceeds thereof for the development of handloom industries. While they would naturally welcome all reasonable steps being taken for developing the handloom industry, they cannot find any

justification for imposing a handicap on the cotton mill industry, already faced with a number of difficult problems, for the purpose. Though it may not be strictly relevant to the present discussions, the Committee would also refer to the restrictions on the production of mill-made dhuties imposed by the Government for enabling the handloom industry to market its products. This restriction is in addition to the special excise duty of 3 pies per yard on all mill-made cloth and has been acting as a severe brake on the progress of the cotton-mill industry.

(iii) *Tea*

In their preliminary memorandum, the Committee had referred to the crisis through which the Tea Industry had passed in 1952 on account of the great fall in the prices of tea. These difficulties were accentuated partly by the heavy burden of excise duties which the Industry had to pay on all tea grown and which it was unable to pass on the consumer. The Industry has since passed over the most acute stage of its difficulties, but only after it had suffered heavy losses, and it is unfortunate that the Government did not at the time give adequate consideration to the need for giving any relief to the Industry. One of the most important steps which the Government were requested to take at the time was either the total abolition of the excise duty or at least an adjustment of the duties on a sliding scale according to the variations in the quality and price.

The Committee are however, glad to note that the Government have since given some relief to the Industry by reducing the rate of the excise duty on all tea other than package tea to as. 1 per lb., and imposed the duty of as. 4 per lb. on all package tea, i.e., tea packed in any kind of container containing not more than 60 lb. net of tea.

The Committee have been informed that, in the existing circumstances, the Tea Industry has not much to complain against the new rates of duty. But they would, at the same time, draw attention to the fact that the Government should have a machinery, like the one suggested above in reply to Question No. 114, for watching the incidence of the duty on any Industry which may, during a particular period, be unable to bear the burden of the duty.

(iv) *Vanaspatti*

The existing excise duty of Rs. 7 per cwt. or a. 1 per lb. on Vanaspatti is, in the prevailing conditions, bearing very heavily on the Industry. There has been an extra-ordinary spurt in the price of the raw groundnut oil, which has steadily gone up during the last few months from Rs. 52 in January last to about Rs. 85 in July. The resultant increase in the price of Vanaspatti appears to be much too high for the limited purchasing power of the average consumer, and is leading to a reduce offtake of the finished products and forcing a curtailment of the production of the Industry. On the other hand as Vanaspatti has now become an essential item of food in India because of its use as a universal cooking medium in place of ghee, there is a strong case for reducing its price to the consumer. The Industry is, however, unable to bring down prices, because of the very high prices for its base raw material and its inability to reduce the other charges, and the abolition of the excise duty would appear to be the only method of achieving the object.

Question 119

No comments.

Question 120

The Committee have no information on the point.

Question 121

No comments.

Question 122

The Committee agree that part of the proceeds of the excise duties should be earmarked for expenditure on research and development schemes designed to improve quality and marketability of the commodities.

They would, however, draw attention to the observations made by them above in reply to Questions Nos. 117 and 118 in regard to the imposition of an excise duty of three pies in the rupee on mill-made cloth for the development of the handloom industry. As they have already stated, they are strongly opposed to the imposition of a duty on any large-scale industries for utilising the proceeds thereof for the development of the competing cottage industries. This objection is not confined only to the cotton mill *vis-a-vis* handloom industries, but to all other industries as well.

Questions 123

Please refer to the answers made in reply to Questions Nos. 117 and 118.

Salt Duty.

Question 124

The Committee presume that the suggestion for the re-imposition of the excise duty on salt has been made in the belief that, while its incidence on the individual consumer may not be very high, the duty will yield considerable revenues to the Government. While the Committee generally agree with this suggestion, they are, at the same time, of opinion that, in a matter which had played such a big role in the National Struggle for Freedom, due consideration should be given to a few other equally important points.

In the first place, it is not perhaps widely known that, simultaneously with the abolition of the excise duty on salt on the 1st April, 1947, the Government also imposed a duty at the rate of as. 2 per standard maund on all salt removed from a licensed salt works or factory, and as. 3-3 pies per standard maund in the case of removal from any salt factory or source administered by the Central Government. The Committee are not aware of the reasons why this levy was imposed at the time of the withdrawal of the excise duty, thus nullifying its beneficial effects, neither have they any information as to the volume of revenue which the Government secure from this special levy. In any case, they are definitely of opinion that, if at all an excise duty is re-imposed on salt, this special levy should be withdrawn.

In the second place, the Committee are of opinion that salt used for industrial purposes should be completely exempted from the payment of any duty or cess, in order to relieve the consuming industries of any unnecessary burden. They believe that there will be no objection to such a suggestion. But they would, at the same time, point out that, if industrial salt is excluded, the net yield of the revenue may not be such as would justify the Government to incur popular displeasure by re-imposing the excise duty on salt.

The Committee would, in this connection, also suggest that, even if no excise duty is re-imposed, the Government should, in modification of their present policy, exempt industrial salts from the liability to pay the special levy at present imposed.

In the third place, an excise duty on salt, will have to be paid on the entire quantity of salt *manufactured* as distinguished from the present levy in the case of *removal* from the salt factory. This would naturally interfere with the present practice of the salt manufacturers of not despatching outside their factory any salt which does not conform to the standard specification laid down by the Government regarding the quality of their products, and the manufacturers will be tempted to market even sub-standard quality having already paid their duty thereon.

The Committee hope that, in formulating their views on the question of the re-imposition of the salt duty, the Commission will kindly take into account the observations made above.

Tax on the Sales or Purchase of Goods and on Advertisements.

Question 125

Answer to both the questions is in the negative.

Question 126

(i) (a) For reasons mentioned in the question itself, the Committee are opposed to the imposition of a tax on the sale of newspapers.

(b) The Committee are also opposed to the imposition of tax on advertisements whether appearing in newspapers or not. The reasons are stated below.

(ii) In the opinion of the Committee, the burden of tax is already heavy in India, and trade and industry are hardly in a position to bear further imports. In the circumstances, a very strong case will have to be made out before either the Centre or the States or the Local Authorities decide to levy a new tax.

In regard particularly to the question of taxing advertisements, due account has to be taken, in the first place, of the very high basic charges which are at present made both by newspapers or other agencies for advertisements. An additional levy, by way of sales tax or licence fee, will force many industrial and commercial undertakings to reduce their advertisements and publicity schemes. Indian concerns, particularly small and medium-sized industries, will be more adversely affected as they will have to face severe competition from foreign undertakings who, with their huge financial resources, are in a position to insert costly advertisements including newspaper publicity to maintain and develop the market for their products and oust the Indian manufacturers from the field.

Secondly, in imposing any sales tax on advertisements, the Central Government must take into account any license fee that may already have been imposed thereon by Local Authorities. The Committee have no information about such fees having been levied by

Local Authorities in other States, but they would draw attention to the fact that the Calcutta Corporation have recently imposed heavy license fees for advertisements in the teeth of opposition of trade and industry.

Question 127

The question implies taxation at source, about the advisability or otherwise of which, the views of the Committee are stated in a latter paragraph.

A. The Committee would answer the first part of the question in the negative. For, in respect of the goods manufactured or produced within the State or those imported into the State from abroad, the States have at present no constitutional competence to levy Excise or Customs Duties or surcharge thereon. They may, however, impose tax on such goods only at the point of sale at rates which may, and actually do, vary from State to State. Sales tax leviable by the States, is not, therefore, an extension or increase of Excise or Customs, as suggested in the Question.

As regards Octroi or terminal tax, the competence of the States to impose them is also not free from ambiguities as while taxes on the entry of goods into a local area for consumption, use or sale therein, and taxes on goods carried by road or inland waterways are included in List II of the Seventh Schedule of the Constitution Act, terminal taxes on goods carried by Railway, Sea or Air are a Union Subject. In practice, however, Octrois are imposed only by Local Bodies on goods entering into their respective territorial jurisdictions and, while an Octroi would necessarily be a tax even on goods entering into a particular local area even from other parts within the State itself, a sales tax imposed by a State will not be discriminatory in character being charged at the same rate as will be applicable to the goods manufactured within the State as a whole.

B. It will, therefore, appear that sales tax as such has a specific function to perform in the country's system of taxation. Besides, in a Federal Scheme of Taxation, the proceeds unlike those of Excise and Customs, are to be allocated to the particular States levying the same.

C. The Committee would at the same time draw attention to the fact that if, as suggested by them later, sales tax is imposed *not by the States* but by the Centre, sales tax may, under certain circumstances, partake of the character of Excise and Customs. There are two possible alternative methods in which the tax may be collected by the Centre. In the first place, unlike Excise Duties which are paid at the time the goods are manufactured and the Customs which are collected at the time of importation, sales tax may be leviable only when the goods are actually sold by the manufacturers or the importers as the case may be. Such a procedure has the advantage of not compelling manufacturers and importers to pay the tax beforehand on the entire volume of goods manufactured or imported, even before they are sold. Or, in other words, the manufacturer or the importer, as the case may be, need not under this system lock up a part of his capital for an uncertain period of time, and thereby lose interest thereon and also pay tax on goods which may not ultimately be sold by him. The Committee have been informed that though, generally speaking, such a system of payment of tax only at the time of sale will be welcomed by the manufacturers and the importers for obvious reasons, there may be certain administrative difficulties which would be obviated in case sales tax is imposed at the time the goods are actually manufactured or imported. They are not in a position to examine the administrative complications of the two systems but they would point out that if sales tax is imposed at the time the goods are manufactured or imported, there would be very little difference between the sales tax on the one hand and Excise and Customs on the other. In such an event sales tax at a uniform rate may be levied by the Centre in the form of surcharges on the existing excise and customs duties and a fresh tax in the case of those goods which are now exempted from the payment of excise duties and/or Customs.

In the case of a sales tax imposed by the Centre there will not naturally be any question of imposing a tax on the goods transported from one State to another, and the question of similarity with Octroi or terminal tax will not arise.

As regards the wider question of the suitability of imposing sales tax at the source, the following points which have a special relevance to the system of taxation now prevailing in West Bengal, may be brought to the attention of the Commission.

It has been pointed out that, if the tax is imposed at source, the large number of registered dealers, who are required at present to maintain various forms and books and to incur considerable expenditure for complying with the tax regulations, will be saved this trouble and that the new system will be advantageous also to the manufacturers and importers in so far as they would be saved the trouble of maintaining separate

accounts with the large number of registered dealers and the far larger number of unregistered dealers, and will be able to satisfy the taxing officers about the actual value of total sales made by them (subject to the usual exemptions) from their books. The Government, on their part, will also stand to gain from the new system as the scope for evasion will be considerably minimised and they will be able to collect much larger revenue than at present, at a much less cost.

On the other hand, there are certain other points which have to be considered in this connection.

In the first place, as it may not be possible to levy the tax on all manufacturers scattered all over the country the question as to which categories of manufacturers will be required to pay the tax will have to be determined. It has been suggested that only those factories, which are registered under the Factories Act, should be brought within the scope of the Scheme, others being excluded to minimise the cost of administration and administrative complications. In such an event, quite a large number of manufacturers who are not at present registered under the Factories Act or who are carrying on their activities on cottage industry lines will be exempted from the payment of the tax. The question as to whether this would lead to any undesirable competition between large and small industries has to be examined in this connection.

In the second place, while there may not be any complication in regard to the sales within the State of the goods thus manufactured or those imported from outside India, some difficulties are, however, expected to arise in the case of sales of these goods outside the State. On the principle that exports to places outside the State would be exempted from the payment of tax, the manufacturers or the importers will not be liable to pay any tax on sales made by them direct to parties outside the State. But, in those cases where sales to outside the States are not made direct by the manufacturers or importers, and which pass through a number of dealers, the particular dealer who exports the goods will, though exempted from paying the tax at the point of export, be in an unfavourable position *vis-a-vis* the manufacturer and importer, having already paid the sales tax on the goods when purchasing from the manufacturer or the importer or from other dealer as the case may be. The question as to whether a refund of the duty may be made to the exporting dealer in such cases is also bristled with some difficulty inasmuch as it will not be possible in many cases, particularly where the goods pass through a number of stages, to ascertain the exact amount of the tax paid on the particular goods which are to be exported. Under the existing law, the dealer, if registered under the Act and exporting the goods outside the State, is not required to pay this tax.

In the third place, so far as goods imported from other places within India are concerned, an effective enforcement of the tax would require the posting of check-posts at every Railway Station, Air Port and riverine points which may not be quite feasible from the administrative point of view. There will also remain the possibility of large quantities of goods crossing the State boundary by the road and, in some places, also by river routes. A further point to be considered, in this connection, is analogous to the one mentioned in the preceding paragraph and arising out of "exports" from the State to a third State of goods 'imported' from a second State.

As already stated, however, the difficulties about taxing good passing from one State to another will not arise if the tax is imposed by the Centre.

Question 128

(a) Yes.

(b) The Committee do not consider that there are any article to which the particular system adopted in respect of Petrol should be extended.

Question 129

(i) A. Apart from the alternatives mentioned in the Question, there is another variety of sales tax, *viz.*, single-point tax levied at the source. Though, under this system, all manufacturers and importers will necessarily have to register their names with the Sales Tax authority, there would be no exemption from tax on sales by one registered dealer to another registered dealer and no question of exclusion from compulsory registration of a dealer below a certain limit of turnover will arise except, as mentioned in answer to question 127, the factories not registered under the Factories Act and cottage industries will be exempted from the payment of the tax. The system will provide for a large number of exempted goods as well as, (in the case of sales tax being a State Subject), of exempted transactions like exports to outside the State and also perhaps to Government Departments.

B. The Committee consider that, under the particular variety of single point system which they are

recommending sales tax will continue to be as significant a source of State revenue as at present and, if certain other steps are also taken such as would minimise the chance of and inducement to evasion, sales tax may even yield a much larger revenue than at present.

(ii) As stated above, the Committee are in favour of a single point tax levied at the source.

(a) Consumer

Single point tax will impose a lesser burden on the consumers than the multiple point tax. The single point tax in West Bengal, for instance, is 3 pice in the rupee. If this is replaced by the multiple point tax, or say, 1 pice in the rupee, the burden will be heavier unless of course, the stages through which the goods pass were limited to a maximum number of three.

As a matter of fact, however, there are large number of goods which pass through more than three or four stages and, unless the rate of tax per rupee is fixed at a lower level than 1 pice in the rupee at each point, the burden will definitely be higher on the consumers than under the existing single-point system.

Besides, the Committee do not rule out the possibility of a reduction in the existing rate of tax in West Bengal under the single point system, and they believe that, if at any time it is considered advisable to fix the total rate at the final point of retail sale at 2 pice in the rupee, there would be considerable complications in adjusting the rates at different stages of sale under a multi-point system.

A further advantage of the single-point system to the consumer arises from the large number of exempted goods which do not bear any tax at all at present,—an advantage which may not be available in the case of a multi-point system of taxation.

(b) Dealer

The multi-point system, though levied at a relatively low rate, is likely to place the dealers in a comparatively disadvantageous position *vis-a-vis* the importer and manufacturer, as the latter will have the advantage of a lower rate of tax in the case of export to other States. Further, under the multi-point system even small dealers will not be excluded though it is hardly possible for such dealers to keep detailed accounts of sales, etc. On the other hand, the single-point system, as is now being administered in West Bengal, places the dealers also under certain handicaps as the list of registered dealers to whom sales are to be made free of tax is not, at any particular point of time, complete and any dealer may, on the strength of a certificate (which may have since been cancelled), obtain goods from any registered dealer free of sales tax, thereby making the latter ultimately responsible for the payment of the tax. Besides, many non-*bona fide* parties manage to get their names registered and help non-registered dealers in getting their goods without payment of sales tax, through their registration certificates, thereby getting some commission for same and also placing the genuine registered dealers in a disadvantageous position, as ultimately genuine registered dealers have to pay tax to the Government for sales made to the consumers or to non-registered dealers while non-registered dealers obtaining the goods from non-*bona fide* registered dealers will not have to pay any such tax. The system of registered dealers which is an inseparable part of a single-point system also makes it necessary for the dealers to maintain an elaborate accounting system indicating sales to registered and non-registered dealers in separate ledgers.

(c) Industry, trade, etc.

The difficulties mentioned above under (b) are also generally experienced by industry, trade, etc.

(d) Government

Under the single-point system, as obtaining in West Bengal, the Government are losing much revenue on account of evasion of tax on a large scale. On the other hand, though, the scope for evasion is likely to be minimised under the multi-point system, the cost of administration will go up as the number of dealers to be covered will be very much more than under the single-point system.

(3) (i) The existing system of sales tax undoubtedly leads to a greater burden being placed on the consumer than is accounted for by the proceeds which accrue to the Exchequer.

In the first place, the Committee believe that the present system necessarily implies a vast administrative machinery entailing proportionately much larger expenses than is accounted for by the amount of the tax collected.

In the second place, the system leaves considerable scope for evasion and to the extent that the dealers, who evade the payment of the tax, charge the amount of the tax to the price of the goods sold by them, the consumers pay tax which is not credited to the revenue of the Government. On the other hand, there are some

dealers who do not add to their price the amount of the tax evaded, and, while not increasing the burden on the consumers, nevertheless under-quote their competitors who pay the tax to the Government and collect the same from the consumers. In the majority of cases, however, the dealers who evade the payment of tax to the Government add only a part of the amount of the tax to the price and, while under-quoting their competitors, also misappropriate a portion of the tax collected by them from the consumers.

(ii) No.

(iii) The Committee have no information.

(iv) The chief complaint against the system of sales tax as obtaining in West Bengal is that it has left room for large scale evasion which has not only placed the *bona fide* dealers in competitive disadvantage *vis-a-vis* the non-*bona fide* dealers but has also involved large financial losses to the Government.

The Committee are, however, of opinion that the scope for evasion will be considerably minimised if sales tax is centralised.

Question 130

(i) No.

(ii) If, as suggested below, a sufficiently large number of articles are exempted altogether, it will not be necessary to impose special rates of levy, lower than the ordinary rate for certain articles. The question will arise only in respect of those articles, mentioned in (iii) below, which are not so exempted altogether.

(iii) In the opinion of the Committee all goods which are:—

- (a) essential for the life of the community,
- (b) raw material for industry, and
- (c) so low priced in retail sales as would make sales tax fractional and incapable of being passed on to the buyer, and also imposing at the same time, in the aggregate, an undue burden on the dealers or manufacturers

should be exempted altogether from the scope of the tax.

As regards the essential goods, the Committee would point out that the exemption should cover all articles that enter into the life of the community, covering such items as food, clothing and housing. Reference may, in this connection, be made to the list of goods included in the Schedule to the Essential Goods (Declaration and Regulation Tax on Sale or Purchase) Act, 1952. This Act was passed with a different objective, namely, of ensuring uniformity of rates of sales tax throughout India on the goods declared to be essential by the Act, but most of the Articles listed in the Schedule to the Act are such as would qualify, on a dispassionate study, for total exemption. The list is not, however, exhaustive, and would require considerable additions for the purpose of total exemption.

The Committee note that the following articles have been included in the list:—

1. Cereals and pulses in all forms, including bread and flour, including atta, maida, suji and bran (except when any such article is sold in sealed containers).
2. Fresh and dried fruits, sugar-cane, coconuts, vegetables, edible tubers, vegetable and flower seeds, bulbs and plants, excluding orchids (except (i) any medicine prepared from any one or more of such articles; and (ii) when any such article is sold in sealed containers).
3. Fresh milk, whole or separate, and milk products, including butter, ghee, chhana, khoa, but excluding sweetmeats.
4. Meat, fish and eggs (except when any such article is sold in sealed containers).
5. Edible oils, and oilseeds from which edible oils are extracted.
6. Gur.
7. Salt.
8. All cloth, woven on hand-looms, and all cotton cloth made in mills or woven on power-looms in which the count of warp yarn employed (excluding the border) is below 35s (whether single or folded).
9. Raw cotton, including ginned and unginned cotton or kapas, cotton thread, cotton yarn, cotton seeds, jute seeds, raw jute, sun-hemp, and mesta.
10. Hides and skins.
11. Fertilisers and manures, agricultural machinery and implements, including parts of such machinery and implements.
12. Cattle foods.
13. Coal including coke and other derivatives, petroleum and petroleum products, including kerosene and motor spirit.

14. Iron and Steel.

15. Books, exercise books, slates and slate pencils and periodical journals.

As has already been stated, the list is not exhaustive, and the Committee would suggest that it should be improved by including in it, among others, the following equally essential items many of which are, it may be noted, exempted from sales tax in West Bengal at present :—

- (1) Vanaspathi (which is much cheaper than Ghee, included in the aforesaid exemption list), and is now a popular cooking medium ;
- (2) Water (but not aerated water and mineral water when sold in bottle or in sealed container) ;
- (3) Sago (i.e., any article sold in the market by the name of sago) ;
- (4) Cooked Foods other than cakes, pastries and Sweetmeats (except when sold in sealed containers) ;
- (5) Livestock, including poultry ;
- (6) Tobacco for Hookah ;
- (7) Quinine ;
- (8) Drugs and medicines except patent medicines ;
- (9) Fire Wood, one of the commonest fuel in the rural areas particularly for the preparation of food ;
- (10) Timber, Cement and Bricks, which are equally important, in some cases perhaps more than Iron and steel included in the exempted list, in providing cheap housing to the people ;
- (11) Electrical energy, which is as much a power generating agency as coal, etc., included in the exemption list ; and
- (12) Matches.

Question 131

A. The Committee have all along been in favour of uniformity between the different States in regard to the imposition of sales tax. In advocating this uniformity, they have always laid greater stress on the desirability of removing restrictions on the free flow of goods from one State to another—a matter to which reference has been made in answer to Question No. 133. In so far as the particular points mentioned in Question No. 131 are concerned, the Committee would point out at the outset that the divergence in the system of taxation in different States, viz., multi-point or single-point, does not necessarily lead to lack of uniformity provided there is no difference in the rates ultimately charged at the retail stage or in the lists of exempted goods and transactions.

There is, however, no doubt that if different States charge varying rates of tax, the wholesale market will be shifted to a State charging a lower rate. Much the same result will ensue from the different lists of exempted goods in different States.

As for exempted transactions, the Committee have been informed that the sales made by dealers in West Bengal to the various Government Departments have recently been subjected to sales tax. This is not in itself open to serious objection, but the withdrawal of the exemptions previously enjoyed by such sales can be justified only if sales to these authorities are also subjected to taxes by other States. For otherwise, suppliers in West Bengal and other States not enjoying such exemptions, will be placed in an unfavourable position *vis-à-vis* their competitors elsewhere. The Committee, however, recognise that there may not be much objection to tax these sales if they are also liable to tax in all the States.

Complaints have, in this connection, been made about difficulties experienced by the suppliers in West Bengal in realising tax on sales of stores to the Directorate General of Supplies and Disposals. Though from 1950, the Central Government Departments agreed to pay tax on all deliveries within West Bengal, in terms of the State Sales Tax law they refused in 1952, following an interpretation of Article 286 of the Constitution by the Attorney General, to pay taxes on deliveries to their local transit depots for ultimate consumption outside the State. The Government of West Bengal, on the other hand, are demanding sales taxes on all deliveries within the State even though the ultimate consignee is outside ; and as a result of this difference of opinion between the Central and the State Governments, the suppliers are being put to unnecessary harassments and losses.

It is necessary that suitable steps should be taken to bring about a uniformity in regard to all these points. The best method according to which this objective may be attained is being considered in the following section.

B. As the Committee have already stated, lack of uniformity in rates and exemptions are not the only

points in regard to which the system of sales tax, as prevailing in the country at present, is now open to criticism. The administration of sales tax has also given rise to a number of other difficulties, the most important of which are :—

- (i) the considerable scope for evasion of the tax which exists at present resulting in a large number of honest tax-payers being unfairly handicapped, and
- (ii) the harassments caused by the Government of one State in imposing their sales tax legislation on the dealers having their principal place of business in other States but exporting their goods to the former State.

All these difficulties may be removed only if, apart from removing the factors which at present encourage evasion and, subject to the tax being levied at source, the Constitution is amended so as to include the item of sales tax as a whole in the Union List. The Committee of the Chamber have, in common with other commercial organizations, all along been pressing for making sales tax a Central Subject. While unfortunately their demand in this respect was not accepted by the framers of the Constitution, the experience of the last few years has amply confirmed the apprehension, expressed by the commercial community earlier, about the chaos that would be caused by the power given to different States to impose sales tax within their territories at rates and systems determined by them.

In answer to question 127, the Committee have expressed their preference for a system of sales tax levied at the source. They have also indicated in appropriate place some of the difficulties which might be experienced in giving effect to this suggestion if sales tax remain as a State Subject. Some of these difficulties relate to the :—

- (a) payment of refund to dealers who, having already paid tax either to the manufacture or to the importer, would have to bear the burden when exporting the goods to outside the State, and
- (b) the collection of sales tax at the point of entry to a particular State.

In the case of a Central tax, levied at source, it would be possible to provide that all goods whether produced within the country (subject to the qualification mentioned in answer to Question No. 127) or imported from outside will pay tax at source, and while no exemption will be made in case of export from one State to another, no tax will also be collected at the point of entry to any State. If such a provision were made, the difficulties mentioned above will be completely eliminated.

The further fact that the system of registered dealers as now in operation will be abolished, and also that the tax will be collected from :—

- (a) all manufacturers who are registered under the Factories Act and are as such even now under same administrative control, and
- (b) all importers, complete records about whom are maintained by the Customs authorities.

will make the administration much simpler, cheaper, efficient and, the Committee would add, also honest. The harassments will be reduced to the minimum and the scope for evasion extremely limited.

C. The Committee realise that the question of apportionment of the proceeds of a tax, levied by Central Legislation, to the various States is not an easy one. As some of the States at present secure a much larger revenue from Sales Tax than others, they may quite conceivably feel apprehensive of loss of revenue as a result of loss of freedom to manipulate the rates of taxation and lists of exemptions or to change the basis of taxation from multi-point to single-point or *vice versa*.

The Committee would, on the other hand, point out that, even under a Federal Scheme of Finance, as is now in operation in India, the comparative volume of State Revenues as such has lost much of its significance as a result of the adoption of the Five Year Plan. The various Development Schemes in the Public Sector have been allocated to the Centre or the States according to the existing allotment of their respective resources. The Plan having been formulated in consultation with the States and finalised with their concurrence, the States can no longer be regarded as completely autonomous as was perhaps contemplated by the framers of the Constitution, and the question as to what particular source of revenue is to be allotted to the States should now be considered more as one of convenience than of distribution of functions under an orthodox Federal Structure.

Subject to these observations, the Committee consider that the best way of apportioning the proceeds of the tax to the States would be to refer the matter to the Finance Commission for enquiry and recommendation. In examining the matter, the later may be

asked to take into account the origin of the tax and the consumption of the goods, subjected to the tax, in the different States in order that no unfair weightage is given either to the States where larger amounts of tax are collected or to those where the goods concerned are consumed.

D. For reasons, already stated, the Committee are in favour of complete centralisation of Sales Tax, the proceeds being distributed among the different States on a fair basis.

They have, in this connection, also examined the other alternatives mentioned in Question No. 131, and their views thereon are stated below :—

(i) A formal or informal convention, if arrived at, will undoubtedly bring about some uniformity in regard to the rates of taxation and the exemptions. This procedure is, however, open to at least two objections, viz.,

(a) The convention may not be applicable to the particular system of taxation, viz., multi-point or single-point. Besides, the scope for evasions within the State and harassments will remain.

(b) Lacking Constitutional sanction, the Convention may not always be strictly followed by some States which may, for some reason or other, consider it necessary to vary the rates and the lists of exemptions.

Besides, if the States agree to establish a Convention which they have every intention to honour, they may also agree to an amendment of the Constitution.

(ii) Central Legislation, promoted at the instance of two or more States, will serve the same object as Central Legislation for all the States, as envisaged in sub-para. (iv) but only with a limited scope. Complications will remain in the States which would not join the scheme and in respect of transactions between these States *inter se* and between those States and those which would enter into agreement.

(iii) The extent to which Constitutional amendment, so as to include certain basic matters connected with sales tax in the Concurrent List will be able to solve the problem will depend upon the nature of the "basic" matters to be so covered. Besides the constitutional limitations of concurrent jurisdiction over matters in respect of the existing State Laws will also have to be examined.

(iv) Having regard to the observations made above, the Committee are of opinion that an amendment of the Constitution so as to include Sales Tax in the Union List is the best solution. The reasons have been elaborated in B above.

Question 132

A. The need for retaining Article 286 in the Constitution arises out of the existing Constitutional pattern of Sales Tax and would be obviated if it is made a Central subject.

B. Not much uniformity has been achieved in regard to exemptions (in favour of "goods essential for the life of the community") under Clause (3) of the Article because the Essential Goods (Declaration and Regulation of Tax on Sale or Purchase) Act, which was passed two years and a half after the inauguration of the Constitution and received the assent of the President on the 9th August 1952, confines the scope of the Act only to those State Laws which may be made **after the commencement of the Act**. All the existing taxes even on the goods declared by the Act to be essential may continue with immunity. The long time lag between the inauguration of the Constitution and the enactment of the Act has further given an opportunity to a few States to make further changes in their respective laws, while the interval between the publication of the draft Bill and its final passage had also enabled some of those States to anticipate all that has now been done by the Centre.

It is understood that, following the Finance Ministers' Conference held in October last year, the Government of India had requested the State Governments to amend their pre-existing laws so as to bring them in conformity with the spirit of the Essential Goods (Declaration and Regulation of Tax on Sales or Purchases) Act but, as far as the Committee have been able to ascertain, nothing much has been done by the State Governments in this respect. The Government of India also have, in a letter to the Federation of India Chambers of Commerce and Industry, expressed their inability to do anything more in the matter as the Act does not apply to the pre-existing State Laws and the decisions to amend such laws as proposed rests primarily with the State Governments concerned.

C. The Committee are of opinion that the list of the goods included in the Schedule to the relevant Act is on the whole satisfactory. But as they have already stated, most of these goods would qualify for exemption whether under a Central Act or the State Laws.

At the same time in the existing circumstances of different systems of Sales Tax in the various States, with full right for the States to vary the lists of exemptions and rates of taxation, a Central Act ensuring uniformity of rates in respect of a number of commodities will, if properly framed, restore some order in the chaos.

The principles which should be followed in determining the list are that all goods which are essential for the life of the community and which are used as raw materials for the manufacture of essential goods should be brought within the scope of the relevant Act. Particular attention should be given to food, clothing, housing, education and medical treatment of the poorer sections of the people, and those items which, by their nature, quality and price, enter into their life should be brought within the scope of uniform taxation. From this point of view, the exclusion of Vanaspathi, Firewood, Cement, timber, bricks, drugs and medicines, from the list appears to be rather unfortunate.

D. As mentioned above, the scope of the provision contained Clause (3) of Article 286 should be extended also to "essential articles" which had been subject to sales tax before the Essential Goods Act come into force.

Question 133

(a) The inclusion of Article 286 in the Constitution was at the time hailed as a great concession by the commercial community who had naturally been disappointed at the rejection of their basic demand for centralisation of Sales Tax. But, as in the case of essential goods, the relevant provisions relating to Inter-State Commerce have also failed to achieve the objective which the framers of the Constitution had in mind. The judgments of the Supreme Court have clearly shown whatever might have been the intention of the Constituent Assembly, the Article has not removed impediments to inter-State trade and commerce for it gives power to a State to collect sales tax from dealers in other States on their sales to the dealers in the former State, even though it is convenient for all concerned if the tax is collected only from the dealers residing within the State. As a result, dealers in one State have not only to be registered under the Sales Tax Laws of a number of other States but also to be conversant with the rates of taxation, lists of exemptions and other rules and regulations in all these States which, again, are subject to changes from time to time. They will also have to maintain separate books of accounts in respect of sales to different States. Further, they may be required to produce books and present themselves before the Taxing officials of the outside States, sometimes conceivably at the same time. Apart from the harassments thus caused to these dealers, the power thus predicated to the States definitely obstructs inter-State trade and commerce.

The Committee do not feel competent to make specific suggestions regarding the remedies which may remove the defects in the Constitution, but they feel that the Commission will carefully examine the judgments of the Supreme Court and make their own suggestions in the light of the issues raised therein.

(b) The Committee believe that unless it is possible to centralise sales tax, it would be much better to provide for a Purchase Tax in order that the tax jurisdiction of each State might be confined to parties residing within the State.

The Committee are not in favour of a mixed system in which purchases should be taxed in certain cases and sales in certain others. This would not, in their opinion, be practicable and will also introduce a number of complications.

Question 134

The Committee have already answered this question in the affirmative. The only effective solution would be centralisation of sales tax.

State Excises

Question 135

(a) (i) The Committee had dealt in detail in their preliminary memorandum with the system of levy of State Excise Duties in different States. For the purpose of ready reference the observations made by them in the aforesaid memorandum are reproduced below. The Committee have no further comments to make on the question, except reiterating that it is absolutely essential to ensure uniformity in the matter between different States.

Among the State Excise Duties, the most important, as far as trade and industry are concerned, are those imposed on the medicinal and toilet preparations containing alcohol. The different rates of tax imposed by the various State Governments and the divergent procedure followed by them in exercising control have long been causing serious difficulties and have been adversely affecting the industry. The stringent controls on some

of those preparations exercised by some of the State Governments to enforce their Prohibition policies, have also considerably complicated the matter.

The Government of India constituted a Committee in 1950 to report on the measures necessary to ensure that such preparations are sold everywhere as far as possible at the same price and for eliminating the difficulties in the flow of products from one State to another owing to diversities in rules regarding transportation and rates on duty.

The report submitted by this Committee sometime back has only been recently published in a summary form. The Committee are reported to have recommended the fixation of uniform rates of duty on medicinal and toilet preparations containing alcohol. The Taxation Enquiry Commission will, no doubt, be supplied with copies of this Report.

The attention of the Committee has, in this connection, been drawn to a Press Report that the various State Governments, to whom the recommendations of the Committee were circulated by the Central Government in July 1952, have already implemented the following interim recommendations of the Committee :—

- (1) A uniform rate of excise duty of Rs. 5/- per proof gallon should be levied by all the State Governments on purely medicinal preparations which are not capable on use as alcoholic beverages;
- (2) A uniform rate of excise duty of Rs. 17/8/- per proof gallon should be charged by all the State Governments on
 - (a) medicinal preparations capable of being used as alcoholic beverages, and
 - (b) toilet preparations.

The Committee have, on the other hand, been informed that this Press Report is not entirely correct. It has, for instance, been stated that the rates of duties for quasi-medicinal preparations (i.e., medicines which can be used for purposes other than medicinal) are still different in different States, as will be evident from Table III appended to this memorandum.

Attention has, in this connection, been also drawn to the fact that every State has a list of quasi-medicinal preparations of its own. This facilitates smuggling from the cheaper source, resulting in the loss of revenue to the State Governments, apart from causing hindrance to the free flow of goods from one part of the country to the other. It has, in this connection, been complained that, in the name of Prohibition, various obstacles on flimsy grounds are being put by officials in the "Prohibition States", thereby retarding the sales of spirituous medicines and other preparations.

It appears from the summary Report of the Enquiry Committee, as published in the Press that, in order to achieve further uniformity in rates, the Enquiry Committee have urged that common lists of restricted and unrestricted preparations should be prepared so that the same preparation is subject to uniform rates of duty in different States, subject, however, to the maximum duty of Rs. 17/8/- per proof gallon, leviable on such preparations.

The question as to how far these recommendations and the actions proposed to be taken thereon by the Government will meet the situation will have to be carefully considered.

Mention may, in this connection, be made of the entry No. 84 in the Union List of subjects in the Constitution of India and Article 268, according to which excise duties on medicinal and toilet preparations containing alcohol, opium, Indian hemp and other narcotic drugs and narcotics to be levied by the Central Government, but collected by the States within which such duties are leviable and appropriated by the latter.

No action appears to have been taken to implement this mandatory provision of the Constitution.

(ii) The Committee are of opinion that, at a time when the Government require additional funds for financing their development schemes, it is not proper that an important source of revenue like excise duty on alcoholic liquors should be relinquished by the various States. It has been reported that the policy of Prohibition which has been in operation in certain States has led to much illicit traffic in liquors. It is not evidently possible for the Committee to state as to how far this report is true. But they would point out that to the extent illicit traffic in liquors has been encouraged, the primary objects of the respective Governments have been nullified simultaneously with the relinquishment of considerable revenue on this account.

The Committee are not aware as to how far, in view of Article 47 of the Constitution of India, it would be possible for any State to reverse the Prohibition policy already initiated by them. But they would like to impress on the Taxation Enquiry Commission the need for cautioning the other States, which have not so far

adopted such a policy, against the financial difficulties that may arise as a result of Prohibition.

(b) As already stated above, excise duties on medicinal and toilet preparations containing alcohol have not so far been levied by the Centre, and the question of co-ordination between the levy of such Central excises and of State excise on alcoholic liquors does not arise.

The Committee would, however, draw attention to the fact, already stated by them, that the stringent controls on some of these medicinal and toilet preparations containing alcohol exercised by some of the State Governments to enforce their Prohibition policies have imposed considerable difficulties on the concerned industries. As an instance, they would draw attention to recent order issued by the Government of Bombay permitting the mass felling of Mowra trees in the State.

The principal oils used by the Soap Industry are coconut oil, groundnut oil, palm oil and mowra oil. In view, however, of the comparative scarcity of coconut oil and groundnut oil, which are also used for human consumption, the Government of India have themselves recognised the need for plantation of mowra trees on a mass scale in order that edible oils may be released for human consumption as far as possible. The Committee also understand that, in pursuance of this policy, some of the State Governments had included mowra trees amongst species recommended for planting on the occasion of the Vana Mohotsava Celebration. Unfortunately, however, the Government of Bombay have recently issued orders for mass felling of mowra trees in the State in order to prevent the flowers from being used for illicit distillation, and they are reported to have adopted a plan of cutting down trees during the course of the year. This action of the Government of Bombay have naturally accentuated the shortage of vegetable oils already caused by a short crop of groundnut oil referred to above, and the prices of all vegetable oils are naturally likely to be affected by a large concentrated demand from a number of industries on a limited supply of same.

General

Question 136

Section 23 of the Sea Customs Act empowers the Central Government to exempt from time to time, by Notification in the Gazette, any goods imported into or exported from India, or into or from any specific port therein from the whole or any part of the customs duties leviable on such goods. According to Section 12 of the Central Excise and Salt Act, 1944, any of the provisions of the Sea Customs Act relating *inter alia* to the levy of or an exemption from customs duties may be applied by the Central Government for the purpose of the imposition of Central excise duties. Further, Section 4A of the Indian Tariff Act, 1934, empowers the Central Government to levy export duty on any article or increase the existing duties, if they are satisfied that such an action should be taken.

As regards import duty, attention may be drawn to the amendment, which was made in March 1951, of the Indian Tariff Act 1934 inserting a new Section 3A empowering the Central Government to levy protective duties on any goods imported into India in respect of which a recommendation has been made by the Tariff Board. As far as the Committee have been able to ascertain, this new Section was not renewed after its expiry in March last.

The Committee are of opinion that the powers now exercised by the Government of India for levying, increasing, reducing or withdrawing the export and excise duties on any particular commodities should remain, in order that suitable action may be taken immediately the internal conditions about production or international situation in regard to the exported articles change. As they have, however, already suggested, this power should be exercised by the Government with due care and attention and after taking into consideration all relevant facts. It is necessary for this purpose to set up a suitable machinery to watch over the condition of particular trade and industry in so far as they are affected by conditions either internal or external.

In so far as import duties are concerned, while the Government have powers conferred by the Sea Customs Act to exempt any article either wholly or partly from the payment of the duty, the power to levy or increase import duties should be exercised only on the recommendation of the Tariff Commission. Such extraordinary powers are necessary in order that an industry may not have to suffer serious losses due to the delay in taking action, the desirability of which has been already examined and endorsed by an expert body like the Tariff Commission.

Question 137

Subject to the observations made in reply to Question 124, the Committee would answer this question in negative.

Question 138

The Committee agree, in principle, to the taxation of "luxury" articles at specially high rates. But they have no suggestion to offer in regard to the particular articles which may be so taxed.

ANNEXURE I.

IMPORT DUTIES ON RAW MATERIALS

Question 104(ii)

(a) Import duty on Lactic Casein

The Plywood Industry has been suffering considerable difficulties on account of high import duty on casein, one of its essential raw materials next in importance only to timber. The import duty on casein is charged at the rate of 30 per cent. *ad valorem* (plus 5 per cent. surcharge) which, at the existing level of C. I. F. prices of the imported stuff, works out at Rs. 450—Rs. 500 per ton and is proving too heavy for the Industry to bear.

Import duty on casein is being assessed under I.C.T. Item No. 87 "all other articles not otherwise specified". Assessment under this item might have been justified at the time when import of casein was on a very small scale. But not that casein is being imported on a large scale for use by the well-developed local plywood industry, it is desirable that casein should be separately classified and assessed at a low rate of duty, not exceeding 15 per cent. *ad valorem*.

(b) Import duty on Soda Ash

The Glass Industry, of which Soda Ash is one of the most important raw material is experiencing serious maladjustment between the cost of production and selling price resulting in huge losses to the individual factories. While the cost has increased by about 300 per cent. on an average as compared to 1938, the selling price has risen by not more than 100 per cent. This rise in the cost is stated to have been caused by a great rise in the prices of raw materials, particularly of Soda Ash. The price of the latter has risen from Rs. 130 per ton in 1938 to about Rs. 375 (imported) and Rs. 446/4/- (indigenous), the current market price. On the other hand, the industry is facing increasing buyers' resistance both within the country and overseas, and stocks are accumulating. In fact, the cost of production of glassware in other foreign countries being much lower, the Indian product are being priced out in overseas markets. If, therefore, the Industry is to retain its market, steps should be taken to bring down prices of Soda Ash. To this end, the Committee would suggest that the Customs Duty of imported Soda Ash should be refunded or at least substantially reduced, as was done in the early thirties. This would not adversely affect the interest of the indigenous Soda Ash Industry, provided simultaneously the following measures are also adopted :—

- (i) There should be quantitative regulation of imports of Soda Ash to cover only the shortfall in indigenous supply.
- (ii) The import of light Soda Ash which only is manufactured in this country should be totally banned and the import of only heavy Soda Ash should be allowed subject to condition (i) above.
- (iii) Consumers of Soda Ash who have not to undergo any technical difficulty in utilising indigenous light Soda Ash should not be allowed to have any quota of imported heavy Soda Ash.
- (iv) Those consumers, who generally require heavy Soda Ash, should be asked to consume a token quantum of indigenous light Soda Ash also, consistently with technical suitability, operational efficiency and economy of production.

(c) Import duty on Borax

The indigenous Enamel Industry is greatly handicapped in developing export market on account of heavy duty on imported chemicals used in the manufacture of enamelwares and the consequent rise in its cost of production compared to that of its competitors in other countries. The import duty on Borax an important chemical used in the industry, is for instance 25 per cent. and constitutes about 40 per cent. of the total cost of the enamels and 20 per cent. of the total cost of the raw materials, including steel, used in the manufacture of domestic enamelwares. On the other hand, the Enamelware Industry in Japan has not to pay any duty at all on imported black sheets for the Enamel Industry. Besides, its labour cost is also less. Naturally the Industry in Japan with its lower cost of production is capturing the overseas market at the expenses of the Indian Industry have further been accentuated on account of limited imports (15 per cent. of past imports) on Borax being allowed direct from the U.S.A. which has practically the world monopoly of the commodity. As a result of the ban, crude Borax purchased from the U.S.A. or other sources is being imported into

Britain and exported therefrom, after being refined, to other countries including India, which has naturally caused a very high increase in the cost of Borax. This high initial cost is again further increased as a result of the high rate of import duty referred to above. The Enamel Industry in Japan has not, however, to suffer a similar handicap as it can import Borax direct from U.S.A. at cheaper rates.

The Committee feel that there is a strong case for allowing a drawback of customs duty on imported chemicals, particularly Borax, used by the Enamelware Industry. In this connection, they would also like to invite attention to the recommendations which had been made in 1945-46 by Sri Nagarwalla, the then Collector of Customs, Calcutta, who had at the time investigated the matter under directions of the Ministry of Finance, to allow drawback of customs duty on imported chemicals used in the Enamelware Industry.

(d) Import duty on Alloy Steel

At present there is a protective duty on Alloy Tool Steel of 31½ per cent. *ad valorem* in case of British manufacture and 44½/10 per cent *ad valorem* in case of imports from other countries, even though the article is not yet manufactured in India and the manufacturers of small tools have to depend entirely on imports from abroad. The action of the Government of India (as per their notification No. 170-Customs, dated the 17th December 1949), in reducing the duty on certain categories of alloy steel, *viz.*, bright drawn and polished drill rods presumably with a view to give relief to the small tools industry has not actually been of any benefit to the small tools industry, as bright drawn and polished drill rods are never used by the industry.

The types of steel which are used in the manufacture of small tools are either black rolled bars or centre-less ground bars. If, on the other hand, bright drawn and finished bars are to be used for manufacture of small tools, they will have to be heat-treated involving losses on account of the consequent conversion of such bars, which are high priced ones, into black rolled bars or centre-less bars which are low priced ones, not to speak of unnecessary labour and expenses for such heat-treatment. Besides, bright drawn bars as a rule are not manufactured over ½" diameter while for manufacture of small tools bars of as much as 6" to 8" diameter are required.

It is, therefore, necessary that the import duty on alloy steel irrespective of the types, should be reduced to a sufficiently low level so as to give relief to the indigenous small tools industry.

(e) Import duty on Carbon Black

Carbon Black, which is an essential raw material for all kinds of rubber products is subjected to an import duty of 31½ per cent. By a notification issued in February '51, however, the Government of India have permitted the manufacturers of rubber tyre to import the article duty-free. While this is undoubtedly a step in the right direction, there is no reason why the benefit should not be extended to the manufacture of other kinds of rubber products as well.

(f) Import duty on Fatty Acid and Hardened Fatty Acid

While there is no duty on tallow, a raw material for the Soap Industry fatty acid and hardened fatty acid which are used as tallow by the Industry (mainly in areas where there is a prejudice against the use of animal fats) have been subjected to a duty of 31½ per cent. *ad valorem* under I.C.T. Item No. 87, thus unnecessarily raising the cost of soaps. As a result, the over-all interests of the industry as also of the consumers who have prejudice against the use of soaps containing tallow with animal fats have been adversely affected. The Committee would, therefore, suggest that the import of Fatty Acid and Hardened Fatty Acid should, like tallow, be duty-free.

(g) Import duty on Gas-filled Cylinders.

While there is no import duty on gas (a raw material for the Lamp Industry) as such, the Cylinders in which this gas is filled is, if new, subjected to an import duty of 31½ per cent. under I.C.T. Item No. 63(28). It has been represented by the Lamp Industry that the imposition of this high import duty on gas-filled new cylinders raises the cost of gas and ultimately, of the finished products. To avoid payment of this high import duty, M/s. Oxygen and Acetylene and Co., Ltd., who import gas on behalf of the Lamp Industry, are getting supplies of gases under the Cylinder Circulation System. Upon import, the Cylinders containing gases are stored in the factories of the Company and distributed to the consumers as and when required, and when the Cylinders are empty they are returned to the Company, who despatch them in batches to the suppliers overseas for refilling and return. As the Cylinders, which are imported within one year of export from India, are allowed duty-free entry, importation of

gas under this system is undoubtedly more economical than importation of gas in new Cylinders. Such importation is nevertheless costly as it involves unnecessary expenditure on account of freight, insurance, etc. on the outward despatch of the empty Cylinders from India, and also delays supply, apart from unnecessarily blocking a large number of Cylinders in the country. It has, therefore, been suggested that new Cylinders filled with gas should be allowed to be imported duty-free or, at least, on payment of an import duty of 5½ per cent. *ad valorem* under I.C.T. Item No. 72(3), to which new Cylinders, if imported empty, are subjected. This would give some welcome relief to the harassed Lamp Industry.

(h) Import duty on Methyl and Iso Propyl Alcohols

As has been stated in reply to Question No. 103, Methyl and Iso Propyl alcohols are non-edible spirits required generally for industrial purposes, but they are classified as Spirits (other than denatured spirits) under item No. 22(4) of the Indian Customs Tariff and the duty is levied at exorbitant rates as for potable spirits. This is not justified. The item should be classified as "Chemical" under Item No. 28 and the duty levied as such. This was also recommended by the Excise Expert Committee, which was appointed by the Government in 1950 to consider matters relating to excise duty on spirituous preparations.

(i) Import duty on raw materials for the Perfumery Industry

As has been stated in reply to Question No. 103, some of the raw materials for the Perfumery industry, such as Resinoids Patchouly leaves, Rose Flowers, Dried, Ambergris, Absolutes, Concrete, etc., are at present classified under "Perfumery" I.C.T. Item No. 31(5) and assessed to a duty at the rate of 62½ per cent., even though they are industrial raw materials and not perfumery as such. The imposition of this high rate of duty on this raw material is not justified, as this is leading to rise in the cost of indigenous production of perfumery goods to a considerable extent.

(j) Import duty on Beech Wood for Card Staves

While Beech Wood is allowed to be imported duty-free for its use in the manufacture of bobbins and shuttles, it is assessed at the rate of 31½ per cent *ad valorem* if used in the manufacture of Card Staves, which are as much an essential wooden store for the textile industry as the other two items. It has been represented that, as a result of the duty, cost of the indigenous industry manufacturing wooden staves has gone high compared to that of the foreign suppliers, and the indigenous products, as a result, are being priced out of the market. The Committee would, therefore suggest that the import duty on Beech Wood for manufacture of Card Staves should be waived.

(k) Import duty on Coconut Oil

The import duty on Coconut Oil, the basic raw material of the Soap Industry, was reduced in November 1951 from 43½ per cent *ad valorem* to 31½ per cent *ad valorem* (standard) and from 31½ per cent to 21 per cent, preferential. It has, however, been represented by the Soap Industry that the duty on Coconut Oil is still very high as the cost of the article represents about 60 per cent of the finished products and should be brought down to a reasonable level. Mention may, in this connection, be made of the fact that the import duties on some other raw materials required by the Soap Industry have been considerably reduced; for instance, in May 1953, the standard rate of duty on Palm oil was reduced from 43½ per cent *ad valorem* to 10 per cent, while the preferential rate of duty at 31½ per cent. *ad valorem* on imports from British Colonies was altogether abolished. The Committee would, therefore, suggest as a part of the policy now being followed in respect of import duties on raw materials for the Soap Industry, the duty on Coconut Oil should also be reduced.

(l) Import duty on Natural Essential Oils

The import duty on Natural Essential Oils and Citronella Oil which are at present levied at 31½ per cent. *ad valorem* and 37½ per cent. *ad valorem* respectively should be substantially reduced as these oils are the very basis of important Essential Oil, Aromatic Chemical and Perfumery compound industries.

ANNEXURE II.

EXPORT DUTIES ON CERTAIN COMMODITIES

Question 113

(a) Export duty on Mustard Oil

The export duty on Mustard Oil, which is 0-3-0 per lb. and is equivalent to about 30 per cent of the value of the oil, should be removed. So long Mustard Oil was

mainly exported to Eastern Pakistan, but now-a-days a good number of oil mills have sprung up in Pakistan and the Government of that country is not also encouraging import of Mustard Oil from India. In fact, in the current import licensing policy issued by the Government of Pakistan no provision has been made for import of oil from India. While the Oil Mills Industry does not hope for revival of market in East Pakistan, it is, on the other hand, receiving enquiries from other countries, and even U.K., for supply of Mustard Oil. But the Industry is not in a position to take advantage of the growing demand of Mustard Oil in other countries as Indian prices, because of the export duty, have always been found to be very high by the buyers in comparison to the prices of Swedish and Chinese Oils. Thus, in U.K., Indian Mustard Oil is being quoted at £154-0-0 per ton as against £131-0-0 and £117-0-0 for Swedish and Chinese oils respectively. The Export Duty on Mustard Oil should, therefore, be totally abolished.

(b) Export duty on Castor Oil

The export duty on Castor Oil, which is levied at Rs. 300 per ton, representing about 20 per cent of the value of the goods, should be suitably reduced. At present, Indian Castor Oil is being quoted at 19 cents per lb. c.i.f. U.S.A., as against German and Brazilian oil at 17½ cents and 18 cents respectively. Attention may also be drawn to the fact that the quality of Brazilian oil is much better than that of the Indian oil. While, on account of the existing duty loss of Indian business has not been appreciably felt, it is essential that the duty should be suitably reduced, so that the Indian prices of Castor Oil are maintained as much competitive as possible.

(c) Export duty on Hospital Rubber Sheetings

A duty of 10 per cent. *ad valorem* was imposed in December last on certain rubber sheetings which were so long treated as free goods on the ground that the item, in the opinion of the Customs authorities, came within the category of "cloth", Item No. 6 of the Customs Export Tariff Schedule. Some of the exporters having represented to the Calcutta Customs authorities that, technically speaking, rubber sheetings could, by no means, be termed as "cloth", the latter have allowed the export of rubber insertion sheetings free of duty as an interim measure, but have not yet made any final decision with regard to classification of hospital rubber sheetings and imposition of duty on the same, even though the matter has been pending for quite a long time. The Customs authorities are stated to have asked the parties concerned to make shipment of consignments of hospital rubber sheetings on payment of duty under protest. This has created an uncertain and confusing situation. Shipments are being held up; foreign buyers are cancelling their orders and the exporters are being subjected to heavy financial losses. For the following reasons, the Committee are strongly of opinion that hospital rubber sheetings should be classified as rubber manufactures and not as cloth and, therefore, be exempted from the duty.

According to the definition of "cloth", as given in Item 6 of the Export Tariff Schedule, "cloth" means "cloth of any description manufactured either wholly from cotton or partly from cotton and partly from any other substance and containing not less than 10 per cent of cotton by weight". It follows from the definition that any material to be called "cloth" should primarily be used for the purpose for which cloth is used and should contain at least 10 per cent of cotton by weight as distinguished from other textile fabrics such as silk fabrics, woolen fabrics, etc. Considered in this light, rubber sheetings, be they hospital rubber sheetings or rubber insertion sheetings, can, by no means, be termed as cloth. These sheetings are definitely processed and mainly manufactured from rubber. The textile insertion, which is used for binding raw rubber with other pigments in order to increase the flexibility and strength of the sheetings is negligible in quantity and loses its identity in the finished products. Further, the purpose for which the finished products *viz.*, rubber sheetings are used are totally different from that for which cloth is used. There are also many other articles such as rubber cloth, nitro-cellulose coated binding cloth, rubber hoses, tyre etc. which, though inserted with textiles to some extent during the processing, are not classified as cloth. In fact, the Government of India in the Ministry of Commerce and Industry have classified them as rubber manufactures in their import/export licensing policy. As stated earlier, the Calcutta Customs authorities also were *prima facie* satisfied with the contention that rubber insertion sheetings are in fact rubber manufactures and not cloth and also allowed the export of the same free of duty. In view of this, and in view of the fact that there is hardly any difference between rubber insertion sheetings and hospital rubber sheetings, there is no reason why the latter item should not also be

treated as rubber manufacture and allowed export free of duty.

In the second place, the classification of rubber hospital sheetings as cloth and the consequent imposition of the export duty on the same will make the Indian goods costlier in foreign market and the local exporters will find it impossible to compete with the overseas suppliers such as Japan, the U.K., Germany etc. In fact, already the foreign buyers are meeting their requirements from other supplies on account of India's inability to supply them with goods at competitive prices and at proper time and export of the goods from the Calcutta Port, since the imposition of the duty, is stated to have come to a standstill. Attention may, in this connection, be drawn to the fact that the export market in rubber sheetings in South East Asiatic countries was developed by the Indian exporters after a good deal of sustained efforts and

once these markets are lost to foreign suppliers, it will be very difficult to regain them.

(d) Export duty on Waterproof Cotton Canvas

The export duty on Waterproof Cotton Canvas, which is at present 10 per cent. *ad valorem*, should be totally withdrawn with a view to maintain the export trade. It has been represented that this duty, coupled with a fairly high import duty on the goods in the importing countries, has made the prices of the Indian goods almost prohibitive, and, as a result, goods from other countries, particularly from Japan, is gradually pushing out the Indian-made materials from the markets of Burma, Malaya, Hongkong, Siam, East Africa, and the Middle East. The following comparative c.i.f. prices for Indian and Japan made waterproof cotton canvas goods are illuminating:—

Quality.	Average Indian Prices.		Average Japanese Prices.	
	Rs.	per yard.	Rs.	Per yard.
18 oz. quality	Rs. 4-8	per yard.	Rs. 4-2	Per yard.
16 oz. „	„ 4-4	„ „	„ 3-14	„ „
14 oz. „	„ 3-15	„ „	„ 3-10	„ „
12 oz. „	„ 3-8	„ „	„ 3-2	„ „
10 oz. „	„ 2-15	„ „	„ 2-10	„ „

Attention may be drawn to the fact that whatever quantity is at present being exported consists either of Tarpaulins on which no export duty is charged or of waterproof canvas against outstanding commitments that cannot be repudiated. It is, therefore, suggested that the export duty should be totally abolished so that the indigenous waterproofing industry, which is an infant one, may maintain and develop its overseas markets. Attention may also be drawn to the fact that the classification of "waterproofed Cotton Canvas" as cloth by the Ministry of Finance for the purpose of duty is rather anomalous, as the Ministry of Commerce and Industry had issued a Notification on the 30th August 1952, excluding synthetic waterproof canvas from the category of cloth.

(e) Export duty on Stockinettes or Hosiery Knitted Fabrics in rolls

In 1951 an import duty on 25 per cent. *ad valorem* was charged by the Customs authority on exports of Hosiery knitted fabrics in rolls as the item came, in their opinion, under the category of cloth as defined in the Customs Tariff Schedule. As a result of the duty, however, the cost of Indian hosiery fabrics became higher than that of other competitors, and export of the items to overseas market, namely, to New Zealand and Australia where there is a big demand for the same (estimated at Rs. 2 crores worth of goods annually) virtually came to a standstill. The subsequent reduction in the export duty on cloth (and consequently also on hosiery knitted fabrics in rolls) in January 1953 to 10 per cent has not helped in the revival of the exports of the latter item, as India's prices are still found to be uncompetitive. The Committee have been informed that while the Indian manufacturers are now quoting 5s. 7½d. per lb. of stockinette c.i.f. or Rs. 3-12-0 with a margin of only 5 per cent profit on ex-factory price, the U.K. is offering the goods at 5s. 3½d. per lb. less 2½ per cent. discount to the importer. There is, therefore, not much scope for the export of Indian hosiery goods to these countries unless there is substantial advantage in price. As, however, the indigenous industry has no scope for economy in its cost of production so as to enable it to compete with U.K. industry, and as further there is no duty on export from the U.K., it is necessary that the export duty on the stockinettes should be withdrawn.

Attention may also be drawn in this connection to the fact that the production capacity of the indigenous industry is very much more than the demand, and it is working only 30 per cent of the capacity on 8-hour shift. To the extent export is facilitated by the withdrawal of the duty, the indigenous industry will also be able to utilise much of its idle capacity.

(f) Need for Imposition of Export Duty on Raw Myrobalan from India

Though the Myrobalan Industries in other countries have to import raw Myrobalan from India, which is its only source of supply, the advantage which the Indian Myrobalan Industry has in the raw material cost compared to the foreign counterparts has been more than counter-balanced by certain other factors.

Firstly, there being no export duty on raw Myrobalan from India, the foreign industries have to pay higher price for the raw material only to the extent accounted for by the freight rate. On the other hand, the Indian Industry is also suffering from a disadvantage,

on account of the preferential shipping freight being imposed on export of raw Myrobalan by the Shipping Companies. For instance, the freight on Myrobalan extract from India to the U.K. is 160 sh. per ton of 20 cwt. while that of crushed Myrobalan is only 101s. 6d. per ton of 20 cwt., there being thus a difference of almost 60 sh. per ton.

Secondly, the foreign manufacturers of Myrobalan Extracts have the advantage of disposing of their home-made Extract in liquid form to their tanneries in tank wagons, whereas the indigenous manufacturers have to convert the liquid Extract into either Solid or Powder form and pack the same in triple bags to ensure safe transit, all of which involve heavy cost.

Thirdly, many foreign countries have imposed heavy import duties on Myrobalan Extract ranging from 8 to 25 per cent. from India keeping, at the same time, import of raw Myrobalan free of duty.

Naturally, the cost of Indian Myrobalan extract has become higher than that of foreign-made Myrobalan extract, and the indigenous industry is unable to compete with the foreign manufacturers. The following figures of cost will illustrate this point:

Landed Cost of Indian Solid Myrobalan Extract in U.K.

3-Ton of Raw Material	£31
Manufacturing Cost of 1 ton of Solid Extract (including the cost of packing material and that of transport to the Port)	£11
Steamer freight from India to U.K.	£ 8
Plus Import duty ranging from 8 to 25 per cent	£ 4 to £12½
	£54 to £62½

Cost of Myrobalan Extract manufactured by U.K. Manufacturers

3-Ton of Raw Material	£31
Steamer freight on 3 Tons	£15
Manufacturing cost of 2-ton of Liquid Extract (from 3 tons of raw material) which are equivalent to 1 ton of Solid Myrobalan Extract	£ 5
	£51

As a result, the Indian Industry is finding it practically impossible to compete in the foreign market and is being gradually ousted. This has involved not only unemployment to a large number of labourers, and unnecessary blocking of capital in the Industry but also loss of large amount of foreign exchange to the country. The Committee are, therefore, of opinion that the Commission should consider the advisability of recommending the imposition of an export duty of a suitable amount on Raw Myrobalan from India to give relief to the Industry. This would also incidentally earn some revenues for Exchequer.

It may be argued that the imposition of the export duty will lead to the use of substitute for raw Myrobalan in foreign countries, affecting the export trade of the country thereby for reasons stated below.

The argument does not, however, appear to stand reason.

In the first place, there is no suitable substitute for raw Myrobalan, which is used as mixtures with other tanning materials. The following extracts from the letter which has been received by the Chamber from the F.R.I., Dehra Dun, is illuminating in this respect:

"Myrobalan has no substitute either within the country or outside. It is not suitable for use as a tan by itself, but in mixtures with other tanning materials, it is valuable for its fermentative, acid forming power, which causes satisfactory plumping of the leather. It imparts mellowness to the leather and is one of the chief bloom-yielding materials."

"Chestnut, divi-divi or any synthetic product has not yet come in the forefront as a rival of Myrobalan."

The Central Leather Research Institute has also informed the Chamber that "there is no efficient substitute for raw Myrobalan anywhere in the world". The Institute has further observed that "chestnut extracts cannot replace Myrobalans", and while "Divi-divi can to a certain extent do so, it is a poor substitute for myrobalans".

In the second place, the imposition of the duty on raw Myrobalan will not increase its cost and ultimately of the finished product, by such a percentage, as would lead to a search for a substitute by the foreign manufacturers and consumers.

In the third place, some of the countries, to which Myrobalan Extracts are exported from India, have imposed a duty ranging from 8 to 25 per cent, without at the same time levying any duty on the import of raw Myrobalan with the object of protecting their own industry. No objection can, therefore, be raised by foreign buyers on the imposition of an export duty on raw Myrobalan, and they will also be willing to pay the duty lest their factories should stop working for want of raw Myrobalans.

PART V.—OTHER TAXES (Central and State)

TAXES ON MOTOR AND OTHER VEHICLES

Question 168

The taxes that road transport at present pay may be generally divided into four categories—

Central Taxes.

- (a) Import duties on motor vehicles and components.
- (b) Import duties and excise on petrol and tyres.

State Taxes.

- (a) Tax on motor vehicles, such as the following :—
 - (i) Vehicle tax or registration fee.
 - (ii) Entrance tax on vehicles entering the State.
 - (iii) Tax or cess on goods or passengers carried by road.
 - (iv) Permit and other fees for Buses and Trucks levied at rates that may pertain to the nature of tax.
- (b) Sales tax on motor vehicles components and petrol.

So far as Central taxes are concerned, no question of lack of uniformity arises, but complaints have been made about the high rates of import duties and also excise duties. The Committee, therefore, welcome the recent decision of the Government to lower the existing high rates of duty on motor car components such as are not manufactured within the country. They hope that this, together with the maintenance of the duties at a somewhat higher level on components within the manufacturing programme of the indigenous automobile industry will help in the development of the industry in India at a rapid pace and will enable the users of road transport to secure good cars at a comparatively cheap price from within the country within a reasonable short space of time.

The Committee have already stated in reply to questions 117 and 118 that there is a case for reduction in the excise duty on petrol in order to lower its price.

The more serious complaint of the road operators is, however, directed against :—

- (i) the comparatively high rate of taxes that motor vehicles, either private or commercial, have to pay not only for movement within the territorial jurisdiction of the State in which they are registered but also for movement across the State boundaries, and
- (ii) the lack of uniformity in the assessment, collection and administration of motor vehicle taxation by different States.

But these factors have been affecting inter-States trade and commerce very adversely.

In West Bengal, for instance, the lorry owners have, since 1949, been required to obtain temporary permits from the State Government for crossing the West Bengal border through the G. T. Road, the fees for such permits, with a validity period of one week only, varying from Rs. 3 to Rs. 6 for one trip only according to distance. The Government of West Bengal have, however, recently introduced a system of temporary permits even for movement of lorries up to and within the border through the G. T. Road, the fee for such permits, with a weekly validity, being Rs. 11. The result of this dual imposition of fees is that a lorry having an up and down trip in a week from Calcutta will have to pay Rs. 11 for movement up to the border and another Rs. 3 to Rs. 6 for movement beyond the border. In other words, it will be subject to an annual fee of Rs. 528 up to or within the border and Rs. 672 to Rs. 816 beyond the border, in addition to the road tax of Rs. 450 to Rs. 1,000 according to the weight of the lorries which the lorry-owners have to pay apart from other taxes.

Similarly exorbitant rates are charged by some other States for using particular roads; the rate is Rs. 58-8-0 per day for using Madhya Bharat roads, that for the Bombay-Agra Road traversing Madhya Bharat territories being as much as Rs. 88-8 per day.

Apart from this high tax for use of roads, the road operators and also the industrial concerns located in one particular State, but having markets in other States, experience some difficulties in plying their propaganda and sales vans or goods lorries in the areas owing, among others, to the following restrictions :—

- (i) A van not being allowed to be registered under the Motor Vehicles Act in more than one place.
- (ii) There being no single authority in the States to endorse road permits for the whole State.

To meet all these difficulties, the Committee consider that the ideal system would be to introduce complete uniformity in regard to motor vehicles taxation, and they would certainly prefer a consolidated tax instead of several taxes by different authorities. They are, however, aware of certain difficulties which may be experienced in giving effect to such a proposal, and they would suggest, for consideration of the Commission, that licences for motor vehicles for the goods and for propaganda should be split up in two categories—on Statewise, and on the all-India basis—and the licence fees may be fixed up accordingly, the fee for the all-India licence being uniform throughout India. In such an event, the different States may impose different rates for licence for movement within their own territorial jurisdiction, but would be required to conform to uniform rate in regard to movements between two or more States. The question whether a Central organisation may not be formed for issuing licences on an all-India basis may also be considered in this connection.

As regards the difficulties of the road operators on account of lack of uniformity in regard to sales tax on motor vehicles, a reference may be made to the views expressed, in reply to questions in Part III.

Question 169

As far as the Committee are aware, except for the Central Road Fund, the proceeds from motor vehicles taxation are not at present earmarked for road maintenance and development. While, generally speaking, proceeds of all taxes should be credited to the general revenues, motor vehicles taxation presents a different problem in so far as motor vehicles pay tax not merely as one of the various sectors of the economy but also by way of compensation to the damages caused to the road system as a result of heavy traffic. Besides, the development of roads and their maintenance is one of the most urgent problems which stand in danger of being neglected on the plea of inadequate financial resources of the Government. As a matter of fact, complaints have been freely made by the users of road transport as well as by the operators against the very bad condition of roads. The responsibility for maintaining the roads in a good condition depends upon the Central Government, States Governments, and Local authorities according to the classes to which they belong. But whoever may be responsible, the fact remains that the roads are not being well-maintained, apart from the paucity of the roads as a whole. To the extent the authorities complain of lack of funds for their comparative inactivity in the matter, the Taxation Enquiry Commission should consider how far it is advisable to utilise the proceeds of the various taxes on roads, motor vehicles and parts thereof, and petrol and other oils for purposes, other than the construction and maintenance in goods condition of all-weather roads and bridges. As this matter is also of considerable relevance to the development of the economic resources of the country, the Committee have no doubt that the Enquiry Commission would consider the matter not merely

from the point of view of the road operators, who are undoubtedly most directly affected, but from that of the general well-being of the country.

Question 170

The Committee generally approve of the recommendations of the Motor Vehicles Taxation Enquiry Commission, 1950, and have no specific comments to make on their main recommendations.

Question 171

NO.

Entertainments Tax

Question 172

A. For reasons already mentioned in the Preliminary Memorandum, the Committee consider the incidence of the tax on the Cinema Industry too heavy. They are not in a position to state as to whether the rates have really reached a point of diminishing returns, but they are of opinion that the matter deserves careful examination.

B. The rates of duty at present differ widely from State to State, and there is no doubt that there should be uniformity therein.

The best method of achieving uniformity would undoubtedly be to make the entertainment tax a Central Subject and allotment of the net proceeds to the States according to the principles that may be laid down in this respect by the Finance Commission. The Committee are, however, conscious of the very strong opposition which such a suggestion might evoke from the State Governments, and they would suggest that, in the event centralisation being not possible, the different States should enter into some manner of convention regarding the rates of duty that may be charged by them.

C. As the Committee have already stated in their Preliminary Memorandum, they are strongly against the present system of taxation in so far as it provides for a graduation in the rates. They would, in this connection, invite reference to the fact that the Film Enquiry Committee also had recommended that the entertainment tax should be levied on a uniform scale at the rate of 20 per cent of the gross takings. In such an event, the exhibitors will be free to adjust the prices of the various classes of tickets to their cost and the ability of their clientele to pay admission prices according to their financial condition. The Film Enquiry Committee also expressed the opinion that such a system will not affect the total revenues from entertainment tax and there should not, therefore, be any ground for objections on the part of the State Governments.

Incidentally, the adoption of the suggestion made above will also make it much easier to centralise the entertainment tax.

Question 173

The Committee consider that exemptions may be granted to the following:

- (i) Educational films.
- (ii) Those shows the net proceeds of which are applied to *bona fide* charities such as are recognised by the Income-tax Act. The State Governments may also be given powers in special cases to extend the scope of exemptions to such other charities as may be considered by them to be deserving of such exemptions.
- (iii) The question of exemptions to the lowest class of tickets will not arise in the event of the tax being applied at a flat rate on the entire gross takings.

Question 174

A. The Committee have been informed that the general source of evasion is by unscrupulous parties who use duplicate tickets. They are reported to put entertainment stamps on one set of tickets and keep regular record of same for the purpose of entertainment tax. The other set of tickets is sold surreptitiously without any entertainment stamps being put on them. The only way to check this is to require all exhibitors to use only consecutive numbers on the tickets they sell mentioning the name of the film, the time and date of the show, the price of admission and the entertainment tax payable on the same, the last item not being required in the case of a flat rate of tax on the gross takings. Tickets should be in triplicates, one portion being retained at the ticket office, one portion being collected by the gate-keeper and the last portion re-

maining with the purchaser. Even now the Industry has a system of check over the sale of tickets, and if the Government also carry out surprise checks and co-operate with the authorised representatives of the Industry, this evil practice may be reduced to the minimum, if not removed entirely.

B. Complimentary tickets have to pay entertainment tax and as such their limitation only will not help. Moreover complimentary tickets have to be issued by the Producers or the Distributors of the films to their patrons as a part of salesmanship. At the same time a limit should be prescribed and a ratio of the number of tickets to the total value of sales may be fixed.

Question 175

In West Bengal, Entertainment Taxes are at present levied on any exhibition, performance, amusement, game or sport to which persons are admitted for payment, and the Committee would not recommend any further extension of the scope of application of the Tax.

Tax on Consumption or Sale of Electricity

Question 176

A. The Committee consider the consumption or sale of Electricity as a suitable source of tax which may be adopted by other States. The rate of tax will of course, be subject to local conditions, and cannot be uniform for all States.

B. Sales for industrial uses should be exempted from payment of the tax.

Question 177

(a) Domestic use of electricity other than for lights and fans should not be taxed, for the following reasons. Whereas the use of lights and fans are for a consumer's personal comfort, the use of refrigerators, cookers and radios reflect a general improvement in the nation's economic and social conditions. Refrigerators preserve food and avoid wastage of food. Cookers save precious fuel like coal and oil necessary for other purposes. For years transport of such fuel has been a bottleneck in the railway system. Radio is or should be a very important medium of education. Therefore, these should be exempt from tax.

(b) For domestic consumption in West Bengal, the exemption existing at present is reasonable and no change should be made in it. The only case which would need sympathetic consideration would be newly electrified areas in any State. For the first two years, no duty should be levied.

Question 178

Please refer to answer to Question 176.

Question 179

No modification in the suggestion made above will be necessary if in some cases Government becomes the actual supplier of electricity. Since the duty is a special tax and since the Government would bill a consumer for electricity consumption in the same manner as a licensee does, no modification is necessary. The amount of the tax is shown as a separate item in the bill and the licensee pays this money into Government Treasury under a particular head. The Government would similarly credit the amount of duty to that head and not take it into account when preparing their own account for supply of electrical energy.

Question 180

As already stated above, there cannot be any uniformity as between different States, as far as rates of tax are concerned. The principles of taxation and exemption should, however, be uniform.

PART VI.—LOCAL TAXATION

Question 210

The Committee strongly oppose the levy of octroi and terminal tax as forms of local taxation. They are also strongly opposed to the suggestion that local bodies should be allowed to levy surcharges on sales tax.

Question 221

A theatre tax or Show tax is very much unsuitable as a form of taxation. The action of certain local bodies and States in levying a Theatre Tax has, in effect, really amounted to double taxation of one and the same source. The Film Enquiry Committee which had examined this matter had strongly recommended its abolition, and the Committee hope that the Taxation Enquiry Commission will also endorse the view of the Film Enquiry Committee.

BHARAT CHAMBER OF COMMERCE, CALCUTTA

REPLIES TO THE QUESTIONNAIRE ISSUED BY THE TAXATION ENQUIRY COMMISSION.

PART I.—THE TAX SYSTEM

Question 1.—Objectives and Relative Place of Different Objectives.

The primary purpose of a Tax Policy is necessarily to raise 'adequate' revenues, 'adequate' for meeting an accepted level of Governmental expenditure. But the different taxes are bound to have effect on the economy, besides bringing in the revenue, and therefore adjustments have to be made between the revenue objective of the tax policy and other objectives. The enlightened business community recognise the new perspective of taxation, but it appears that the real controversy as to extra-revenue purposes of taxation lies in the degree to which one or more of such purposes are sought to be carried out at any particular stage of development. The Chamber is not in favour of looking upon the tax policy as the main lever of economic control.

At the present stage of India's economic development, the emphasis must necessarily be on production of additional wealth and on expansion of employment opportunities. The Chamber therefore feels that at the present stage, among the extra-revenue objectives mentioned by the Commission, the objective of encouraging "incentives to work, to save, and to invest" should be given the highest priority. From among other objectives mentioned by the Commission, the 'maintenance of the external balance of the economy', may be accorded the next place in order of priority. The place that the foreign capital occupies in the economic life of the country, and the roles assigned to fresh foreign capital and foreign trade in the programme of development lend special significance to this objective. The import duties on raw materials and machines, the export duties, and tax measures in respect of foreign incomes of Indians and Indian incomes of foreigners in India have significant effect on the balance of payments position in the country.

While the chamber are at one with the Government in the welfare ideals of the State, it considers that at the present stage of development, the levels of expenditure for realisation of such ideals should be kept in bound in order that the tax system may not cast a prohibitive burden upon the production of wealth which is intended to be achieved on the basis of a 'mixed economy', and in which private enterprise has been assigned heavy responsibilities.

In the opinion of the Chamber, at the present stage much emphasis need not be laid on the utilisation of taxation as instruments for reducing inequality of income or wealth or for using them as measures in dealing with inflationary and deflationary situation. Such non-fiscal purposes may acquire greater importance only at a later stages of development. The Chamber is not aware of any measure of equality or inequality to have been accepted or rejected by the community, or for the matter of that by the Planning Commission or the Government. During the last decade or so such undetermined objectives were rather too much brought in in measures like Excess Profits Tax, Business Profits Tax, Capital Gains Tax, High Income and Corporation Tax, etc. But these along with other measures in the field of labour welfare have adversely affected the economy. A shift of income has taken place from the traditional saver's class to those who were never prone to save. The latter group could not be trained to save either, while diverting income to them. The result has been dearth of saving for capital formation.

The Chamber would like to emphasise that productivity of unit capital in the private sector is much higher than in the public sector and because the private sector is expected to carry the bulk of the responsibility for industrial expansion and for achieving the desired shift in employment from agriculture to industry, the taxing system must be adapted at the present stage to aid business activities especially industrial activities.

The volume of the margin of current income that may be left to individual earner and with different categories of businesses out of their business incomes, largely determine the incentives for work, flow of venture capital, and investments. In the opinion of the Chamber, therefore, at the present primary stage of development when the capital resources are meagre compared to the requirements, larger scope need be provided for individual and corporate savings on voluntary basis and the people, in whatever field of activity, should be left with a greater command over their current incomes for determining their respective levels of expenditure.

As to the modifications needed in the Indian tax system, the Chamber would refer to the replies given in the subsequent questions raised by the Commission. They would however stress even here that to inject greater vigour in the economy the load of direct taxation is required to be slashed substantially. At the present primary stage of development our mixed economy cannot function with the existing load of direct taxes.

Question 2.—Criteria for determining Equity of a Taxing System.

The Chamber does not consider it possible to lay down some absolute criteria for all times for determining the equity of a tax system. The basic criterion to determine the equity of a tax system would naturally be 'social expediency', the contents of which would vary at different stages and phases of the economic conditions of the country and the social ideals set before it. So long as the tax fabric is considered socially expedient it has to be accepted as "equitable". The social expediency criterion is, however, a complex of several other criteria and different criteria would be important for determining the equity of the different taxes in order that the entire tax fabric may be considered expedient from the social and economic standpoints. In the opinion of the Chamber, a tax system may be considered as socially expedient at any particular point of time if it brings "adequate" revenues without causing unbalance between the investment and consumption incentives.

The criteria connected with achievement of non-fiscal purposes can be applied only after certain stages of development. The criteria of 'equal proportional sacrifice' or 'benefits received', etc., cannot have immediate applicability.

At the present stage and phase, the effect of a tax on the economic propensity to risk, venture and invest should be the first criterion to judge the social expediency and therefore, equity of the tax system as a whole *vis-à-vis* the economy. The Chamber would emphasise that equity should mean at the present stage a larger opportunity for investment by a wider number of individuals and corporations. The criterion of wider distribution of income and wealth should be taken to mean wider distribution of the opportunities for investment, for the purpose of creating additional wealth by a larger number of men in the country.

By way of clarification, the Chamber may observe that the new Industries are not allowed sufficient reliefs and incentives even during the initial years, which Pakistan, Egypt, etc., have allowed. In Pakistan the individual investors are also allowed deductions for investments in specified industries. Then again the Income Tax and Super Tax computations are considered inequitable; the Corporation tax puts the smaller companies into difficulties as they have to depend more on share capital than on loan capital to which recourse can be taken by the "Bigger" concerns. The burden on share capital than on loan capital to which recourse very class of the society who have the will to save, and thus their capacity to save is seriously affected. During recent years the Government took away a considerable portion of the Exporters' margins of income by imposing Export Duties. But with the emergence of the recession, and increased international competitions subsidies have not come to the Exporters. These are all considered to be inequitable from the standpoint of business incentives.

The Chamber would also like to mention that one criterion to determine the equity may be to make the tax measures as neutral as possible in their effect on the free flow of trade and industry within the country. Such neutrality criterion is mentioned only for emphasising that the taxes should not be allowed to have restrictive effect on the flow of investments, movement of trade, and the decisions of the individual and business community. By way of illustration, it may be said that Sales Tax in the Bombay State has a discriminatory effect on the export trade, in so far as the Mills have not to pay the tax if they themselves export, whereas dealers have to pay the tax; Sales tax is levied on cotton in Bihar, but the raw material is exempt in other States with the result that the investments in Colton Mills are subjected to discrimination in comparison with the Mills in other States.

Yet another criterion for judging the equity of a particular tax may be the manner in which it affects the 'earning power' of the tax payer. It is to be conceded that the marginal efficiency of capital is higher at upper income brackets and a tax should not unduly affect the power of earning income and consequentially

the power of supporting the established Government. In applying the 'ability to pay' criterion upon the upper bracket individual earners and corporations, it should be carefully considered that the ability to earn is not affected by the impositions. The social expediency principle seems to justify the adoption of such criterion at the present stage of the country's development.

By widening the orbit of indirect taxes, by reducing the proportion of direct taxes in the revenue, and by relying a little more on non-tax revenues on the lines indicated in the course of replies to other Questions, may improve the system so far as equity is concerned.

Question 3.—"Ability to Pay" Principle in Indian Tax System.

There is no easy calculus for measuring the ability of the individuals and the Corporate Bodies in bearing the Governmental imposts. The principle of equity requires that the burden of public charges should be distributed among the different classes and individuals in such a manner that each one can be made to contribute according to his respective tax bearing capacities. Such tax bearing capacities are to be measured in relation to income, expenses required for an accepted standard of living of the earner and his dependents, the scope for providing a reasonable amount of social security for the future, and incentives for saving and investment. In respect of direct taxes, therefore, the question of appropriate graduation of incomes, and refinements for expenses, savings and investment, are required to be made. The burdens, both of direct and indirect taxes, have also to be taken into consideration in measuring the ability at each level of income and the rate of progression in matters of taxation has to be adjusted with reference to the need for leaving a fair portion of the income with the earner for further investment.

It is felt that the ability-to-pay principle has not been properly used in the Indian tax system. Firstly, the direct taxes are made now to contribute 40 per cent. of the revenues and these are to be borne by a microscopic minority of the population. Such reliance on direct taxes on such a narrow base has resulted in compromising the ability to pay principle with increased revenue needs. In respect of Income-tax other than Corporation tax, the rate of progression has been too steep at the upper income brackets and the size of the money income itself is taken as almost the only measure of the ability to pay without adequately providing for the expenses either for the individual or for the company on the lines of countries like the U.S.A., U.K., Australia, Canada, etc. In the Corporation tax again, there is inadequate recognition of the ability to pay principle in so far as the Corporation tax operates on Corporate Bodies even if they earn less than such amounts which are exempted for Individuals and Hindu Undivided Families. In property taxation, the *bond fide* rental value of the property is taxed without adequate consideration of the changes in the expenditure to be incurred in the maintaining the property or in collecting that income. Even the Municipal Taxes are not fully allowed.

The major burden of the indirect taxes also fall on the very same groups of persons who bear the incidence of the high rates of income-tax.

In the opinion of the Chamber, it is possible to secure a better application of the ability to pay principle, by spreading the population coverage of indirect taxes so as to yield more revenue and re-adjusting the income-tax structure. It has been estimated that at present some 12 per cent. of the people contribute some 86 per cent. of the tax revenues, and it cannot be said that 88 per cent. of the population has ability to contribute only 14 per cent. of the Governmental charges. These 88 per cent. has to be touched through indirect taxes to contribute more and to that extent the load on the balance of 12 per cent. of the population needs be lowered to bring the tax draft within their tax bearing capacities. For this latter purpose the progression in income-tax and super-tax rates require substantial modification, and in assessment of the income earners adequate consideration is required to be given to the personal allowances, which are allowed under all modern tax systems. The application of the maximum rate of income-tax at Rs. 15,000 level and that without due personal allowances is a poor recognition of the ability to pay principle. The exact re-adjustments which the Chamber may suggest are indicated in reply to questions in Part II and under Q. No. 66.

Question 4.—Use of the Taxable Capacity of Different Sections of the Community in the Indian Tax System.

There is no absolute definition or measure of taxable capacity of a society or an Individual. It may be described for a mixed economy as the capacity to bear the burden of imposts by the Governments and other Public Authorities without undue interference with productive activity and the functioning of a dynamic economy. Taxable capacity changes with volume of National In-

come, pattern of public expenditure and the people's psychology.

In the opinion of the Chamber, the taxable capacity of the various sections of the Community, has not been properly utilised under the Indian tax system. For example, the Income tax in India is virtually an urban tax and is paid by some 25 per cent. of the country's population, and some 4.25 per cent. of the urban people who constitute some 17 per cent. of the population of the country. It has been estimated that 88 per cent. of the population earn less than Rs. 2,000 a year each and they contribute only some 14 per cent. of the tax revenues, while some 12 per cent. of the people have to bear the burden of 86 per cent. of the tax revenues. It is, however, felt that because of the low per capita income, it may not be feasible or economical to bring the people in the lower income brackets and specially those living in the rural areas, within the orbit of the direct tax. Their tax bearing capacities are to be tapped only through indirect taxes. It should be seen however, that men with comparable incomes in the rural and urban areas are not differently taxed. At the present moment, people living in rural areas and earning their incomes from sources like Agriculture, Forests, Fisheries, Orchards, Poultry, etc., are probably paying much less to the coffers of the Governments than those who are earning from sources like salaries, business, trades and professions, etc., in the urban areas. An average agriculturist or a village craftsman bears much lower burden of tax than his counterpart in an urban area. A land holder pays in the aggregate less to the Government than his comparable counterpart in non-agricultural occupation subjected to Income-tax. The smaller Corporate Bodies are crippled by Corporation Tax and therefore the burden on them should be taken to have exceeded their taxable capacity. The load of per capita Indirect Taxes on the 'richer' section is stated to be Rs. 56-3-0 whereas it is Rs. 2-8-0 per year on the "poor". The impact of the majority of the States Taxes falls on the assesseees in the urban areas. The Report of the National Sample Survey indicates that in a total per capita expenditure of Rs. 220 in rural areas only Rs. 1-25 is paid by way of land rent and taxes as compared to Rs. 15-8 spent on ceremonial functions. Land Revenue and agricultural income-tax constitute less than 10 per cent. of the total revenues of the Central and State Governments. Of the excise duties on mill-made cloth, sugar, coal and of import and excise duties on tobacco, betelnuts, etc., very little fall on rural population; because only 10 per cent. is spent on clothing, 3 per cent. on betelnuts and tobacco and practically nothing on sugar. The burden of import and excise duties on Kerosene and Matches is also very small as only 3 per cent. of the expenditure is on light and fuel combined. On the other hand agricultural prices have continued to be high for many years, and a shift in income has taken place towards lower income groups. So, it appears that there is some layer of taxable capacity in rural areas and lower income groups generally.

Question 5.—Proportion of Tax Revenue to National Income in India.

It is true that in India the proportion of tax revenue to national income is low in comparison with certain other countries, but it should be considered that such proportion of taxes to national income does not indicate the burden on those who pay the tax nor do they indicate the effect of taxation on incentives to work, savings and investment in the country. The low proportion only indicates the low taxable capacity of the country. The per capita income converted in dollars will show that while it was only 57 in India in 1949-50, it was 773 in Great Britain, 1453 in the U.S.A., 856 in New Zealand, 870 in Canada, 67 in Ceylon. Secondly, the population coverage of income-tax in India is 25 per cent., as against 44 per cent. in the U.K., 37 per cent. in the U.S.A., 34 per cent., in Australia, 20 per cent. in Canada and the narrow coverage proves that the low proportion of tax revenue to National Income does not mean lower burden on the tax payer in India. Then again, in Argentine which is also a predominantly agricultural country like India, income-tax rises to a maximum of 27 per cent., whereas in India it rose in 1947-48 to 92 per cent. at an income level of Rs. 10 lakhs and stands at roughly 78 per cent. now. In Japan the maximum percentage of income-tax is 55. The present level of direct tax in India has crossed the taxable bearing capacity of the assesseees. Some increase in revenue is possible from indirect taxes if suitably adjusted and extended. But this will be offset by the imperative decline in direct taxes.

At the present level of per capita income and in consideration of the meagreness of investment capital, the Chamber does not consider it feasible to increase the proportion of tax revenue to the national income in the near future. If the country is to be developed, on the basis of a mixed economy, it would not be advisable to attempt for increasing this proportion. As far as the Chamber is able to understand, the Planning Commission also do not envisage any increase in this proportion during the initial stages of development.

Question 6.—Relative Place of Direct and Indirect Taxes.

Till the per capita national income increases so as to warrant the inclusion of a larger number of income earners within the orbit of direct taxes, indirect taxes are bound to continue as the sheet anchor of the country's taxation system. In view of the low per capita income in the country, widening of the base for the direct taxes among a larger number of population may not be feasible and economical. To impose a large draft on the profits of a few corporate organisations and on less than a quarter per cent. of the population's income, cannot also produce the desirable yield while unduly undermining their income earning capacity. The Committee feel that the ideology of relying more on direct taxes or at least to secure a 50:50 ratio is not feasible in India now. Eagerness to go in for what may be termed as "equalising taxation" at this stage means further contraction in the coverage of direct taxes. In the revenues of the Central and State Governments combined, while the share of taxes on income constituted only 9.6 per cent. in 1937-38, it was raised upto 35.8 per cent. in 1944-45 and was more than 20 per cent. in 1952-53. The share of Corporation tax in the Central Government revenue was only 2.2 per cent. in 1937-38, and it went upto nearly 25 per cent. in 1944-45 and still it stands at a little more than 10 per cent.; while the share of the Customs declined from nearly 50 per cent. of the Central revenues in 1937-38 to a little over 40 per cent. in 1952-53. The Chamber considers that at the present stage of development, the proportion of indirect taxes should be much higher than that of the direct taxes. The proportion of indirect taxes at a level of 75 or 80 per cent. of the revenues may be considered reasonable for many years to come.

In this connection, it may be mentioned that in Canada, the share of indirect tax was 74 per cent. of the total revenues in 1928 as compared to the share of direct personal taxes of 6.4 per cent. and of direct corporation taxes of 4.9 per cent., and in that year the per capita national income of that country, after payment of all taxes was \$464 as compared to the present per capita national income of India of only \$ 57. Indirect taxes in the U.S.A. was also very high during the developmental stages of 1890's. Even now, in most of the foreign countries, the tendency in local taxation is to realise more and more from indirect taxes than on direct taxes, even though such local Bodies have powers to impose direct taxes. In the U.K. under the Socialistic Labour Government also, the proportion of Indirect taxes was increased from 41 per cent. of 1928-29 and 44 per cent. of 1938-39 to 46 per cent. in 1948-49.

Question 7.—Non-tax Revenues.

In the opinion of the Chamber, non-tax revenues should increase in future. A large portion of the investible capital of the Society is being invested in public undertakings and therefore, the incomes from these should be relied on by the Government as a source of revenue. The contributions from Railways, Posts and Telegraphs, State Governments' Road Transport Organisations, and other States' commercial undertakings, levies from irrigation projects, etc., should provide the Government with larger revenues. Under the Five Year Plan, roughly 60 per cent. of the current savings of the society are being diverted to the public sector and therefore it should be considered reasonable to expect that such undertakings should be able to contribute larger amounts to the revenues of the State. (An estimate of the return which should be available from Public Commercial Undertakings may be made on the basis of a return of 6 per cent. of investments in the Public Undertakings of a Commercial nature, after provisions for income-tax applicable on comparable undertakings in the Private Sector and without unduly charging for the goods supplied or the services rendered.)

The Chamber would also like to emphasise that among the non-tax revenues of the State, draft on labour and services of individuals should be also considered as desirable sources of indirect revenue. It appears that it may not be possible to develop the country's economy at the desired pace without such draft on individual labour and service. Too much reliance on monetary expenditure for development calls for larger revenues and the base for raising such revenue is found too slender for the purpose, and therefore, the development gets impeded. This vicious circle can be partially met if greater reliance is placed on service revenues. By such drafts on labour and service a considerable portion of the estimated expenditures on rural developments and welfare measures can be saved, and this saving may be considered as Service Revenues. The Planning Commission also seem to have some such idea and it is reported to have been partially introduced in the Community Projects. (Vide Para. 34 of the Report.)

Questions 8 and 9.—Funding or Ear-marking of Taxes and Levy of Cess.

In the opinion of the Chamber, funding or ear-marking of the receipts of particular taxes for specific pur-

poses is not desirable as a general rule. Such finding or earmarking if carried beyond a very restricted limit (if at all) brings undesirable rigidity in the Public Finance.

In the exceptional circumstances of India, when rapid developments are desired and public funds are slender, Imposition of Cess may be necessary and desirable. But in its incidence a Cess must conform to the "benefits received" criterion of equity. The Chamber is therefore strongly opposed to the policy of the Government to levy cess on one industry to subsidise another industry, as has recently been done in the form of a Cess on mill-made cloth to raise some Rs. 6 crores for subsidising Handloom Industry. This is inequitable in principle and in this particular instance is against the interest of the common consumers of cloth in India. A Cess in a region or on a particular industry can be levied only for the benefit of the local people or that particular industry who bear the burden of the levy.

Question 10.—Extension of State Undertaking *vis-a-vis* Revenue.

It can generally be said that the revenues from the commercial undertakings and State domains have been discouraging so long and the productivity of capital in the State undertakings has been found to be lower than that in the private sector. The revenues from the proceeds of agricultural products, forests, subsidised companies, irrigation, etc., were Rs. 27.32 lakhs in 1924-25, Rs. 19.05 lakhs in 1936-37, Rs. 125.72 lakhs in 1944-45, Rs. 143.8 lakhs in 1946-47, in Undivided Bengal. As compared to these, the revenues from all such undertakings in West Bengal were Rs. 44.3 lakhs in 1950-51, Rs. 37.6 lakhs in 1951-52, and 1952-53, though the West Bengal Government went in for undertaking profitable lines of commercial activity like the Road Transport. While the private Road Transport Services were making considerable profits, the State Transport Organisation of some State Governments exhibited net losses to the extent that operational expense per vehicle has been higher than the gross receipts per vehicle.

In regard to pricing, the Chamber would like to mention that the freight rates in some State Transport Service have been higher than those in the private services. Where there are vital State monopolies like Forests, the prices have been high with the result that the consuming industries have suffered. Where such high prices are charged by the State monopolies, whether these are Railways or Postal services or the Telephones, or the Forests, there is an element of taxation in such prices in so far as these services can be rendered by private undertakings at cheaper costs. The prices of State Undertakings should be comparable to those that may be charged by a Private Enterprise without monopoly advantage. If such a price policy is followed then unless there is inefficiency there should be surplus except in those cases where the State may undertake the enterprise because Private Capital considers it "unremunerative". The Chamber would, therefore, suggest that except those already undertaken by the Governments under the Five Year Plan, there should be no further extension of State undertakings. The Governments should also withdraw from some undertakings like Road Transport. Such withdrawals may bring more income to the Governments by way taxes and would also help employment.

Question 11.—Surplus earned by State Undertakings *vis-a-vis* General Revenues.

State Undertakings should be managed by autonomous Corporations and these should bear their share of the rates and taxes at par with the private undertakings of comparable sizes and types. Thereafter, the net surplus may be apportioned between the respective Governments and Corporations themselves. In cases of State monopolies, a portion of the net surplus after payment of the rates and taxes at standard rates, may be also allocated to a separate fund for financing development projects. The Chamber would like to mention in this connection that the U. K. public industries like the private, have to bear their share of the rates and taxes and the nationalised industries in the U.K. were brought within the scope of the profits tax by the Finance Act of 1947. Payments have also to be made by the nationalised industries to the local Governments in lieu of the rates in terms of the provisions of the local Government Act of 1948.

Question 12.—Basis of differentiation for measuring the incidence.

In the opinion of the Chamber, neither income nor occupation nor residence can singly be taken as a basis for division of the people into classes for the purpose of examining the incidence of taxation. All the three factors have to be taken into consideration.

Regarding income, a differentiation may be made between the comparative ease with which the income is earned. For example, incomes earned under salaries or by carrying on a business, trade or profession, are earned with greater exertion than the incomes from inherited properties. The degree of risk involved in

earning income as also sources of income are factors that deserve consideration. With respect to direct tax, while differentiating on the basis of income adequate consideration need be given to the average size of the family and the number of dependents in the different income Groups as also the residence (rural or urban) of the family where the income is to be spent for living.

It is generally felt that the incidence of tax on middle-class people living in the urban areas and engaged in occupations like service, independent trade or profession, is very high at the present, while this very class has been the traditional savers. In examining the incidence on such classes of people or on any other class, the standard of living and the pattern of consumption should also be taken into consideration along with the number of dependents in such families.

On another basis also a differentiation may be made for examining incidence of taxation. In India family constituted the unit of production in the past and even now, Hindu Undivided Family is an institution characteristic of the Indian Society. The incidence of the tax system on the institution of joint family may be specially examined, and the Chamber's views in this regard are indicated subsequently under Question No. 70.

Question 13.—Opinion as to the Burden of the Present Tax System on various Classes and in Different States.

As was observed in the preliminary Memorandum of the Chamber, the first impact of the various taxes, seems to be more important than the possible ultimate incidence and therefore the word "burden" is to be taken to signify the first impact of the various taxes. An appraisal of the impact of the various taxes is also important because it directly influences the decisions for consumption, savings, incentives to work, incentives for risk taking and undertaking business ventures. The direct impact of the various taxes also influences the volume of the venture capital that may be required for undertaking business activities. For example, Rs. 142 crores of Import duties were realised during 1951-52 and a few hundred of Importers had to bear the burden and the risk of this additional amount, as they had to make the payment at the time of clearing the goods; the process of shifting the burden was a complex of many factors.

(a) The income tax is paid by about a quarter of one per cent. of the working population of the country. The coverage of the Agricultural Income-tax as compared to the total population is also virtually negligible as this tax does not exist at all in the majority of the Part A and Part B States. Then again, the income-tax in India is virtually an urban tax with a steep rate of progression as pointed out elsewhere. As already pointed out above, the burden of most of the Import and Excise Duties are not also borne by the rural people.

In the next place, the Chamber would like to point out that on occupational basis, the people who earn from occupations in Agriculture, Forests, Poultry, Fishery, etc., are taxed very little as compared to those who earn from industry, trade, professions and even from salaries.

In respect of personal Income-tax, the incidence in the middle and upper income brackets is high. The middle and upper group income-tax payers constitute the traditional saver class and those in this bracket also bear the bulk of the burden of the indirect taxes, whether Central, State or Local. It appears that the incidence in these brackets as related to their taxable capacities, is very high.

It may be mentioned in this connection that the population coverage of Income-tax in the U.K. is 44 per cent., in the U.S.A. about 37 per cent., in Australia about 34 per cent. and in Canada roughly 20 per cent. It may also be mentioned that even in the U.S.A. an income of 15,000 has to bear an Income-tax burden of only 4.9 per cent. whereas in India, in 1952, this percentage worked out to 7.6. Similarly for an income of Rs. 50,000, the percentage in U.S.A. was 20.3 in 1952 as compared to 30.9 in India and for an income of Rs. 1 lakh, the respective percentages were 31.6 and 50.1.

The burden of the Corporation tax is also high as compared to the total paid-up capital of the Corporations and therefore those who invest in the shares of the Corporations have to bear a higher burden of tax because of the Corporation tax and the dividend tax, than those who invest in lands or pursuits like Agriculture, Poultry, Fisheries, etc. This applies even to small investors. In a recent study in America, it has been found that 56 per cent. of the investors considered the Corporation tax and a simultaneous dividend tax as restrictive on investment incentives.

Those who carry on small businesses but on Corporate structures, also find it difficult to bear the burden of the Corporation tax as they have to depend upon more on share capital than on loan capital. The relative incidence of Corporation tax on different sizes

of Corporate businesses is also different and operates against the smaller units.

(b) The regional distribution of tax burden in India is also considerable. Being citizens of the same State of India the people in the different States with comparable incomes have to bear very widely different burdens of taxes. The *per capita* tax in Rupees in Part A States and Part B States in India varied from Rs. 11.8 in West Bengal, and Rs. 13.3 in Bombay. In Uttar Pradesh, Rs. 8.3 in Madras, Rs. 11.2 in Hyderabad, Rs. 11.8 in West Bengal, and Rs. 13.3 in Bombay. In respect of individual taxes also, like Sales-tax, State Excise, Land Revenue, Entertainment tax, Motor Vehicles tax, etc., the burden is widely different in the different States. The difference, however, can be examined if the income levels in the different States are correlated to the patterns of consumption in those States. This position may well be scrutinised by the Commission on the basis of the figures collected by the Finance Commission and the National Sample Survey made by the Government of India.

In the Municipal areas in different States there is also considerable disparity in the burdens of tax. For example, the *per capita* tax realised by the Madras Corporation in 1949-50 was 13.3 as compared to Rs. 19 in Bombay and Rs. 14 in Calcutta.

The Chamber would therefore like to suggest that while some degree of State-wise differences may be unavoidable attempts may be made for bringing more parity in the burden of the taxes in the different parts of India, by touching the people in low-taxed States through levy of such indirect taxes which may reach them.

Question 14.—Shifts in Distribution of Income and Relative Incidence of Tax.

Though the Chamber does not possess any authoritative statistics to measure the extent of the shift in the distribution of income during the recent years, there is no gainsaying the fact that considerable shifts in income have taken place due to the high agricultural prices, transfer of the increased workers' wages to the rural areas, and the policy of the Government in different economic matters, specially labour.

The shift in income has first been towards rural areas and then again from the middle income brackets towards the workers in the factories and generally towards lower income groups. The following figures indicate the rise in the deposits of Co-operative Banks and Post Office Savings Banks as compared to decline in the Scheduled Banks. This shift indicate that there has been a shift of income and saving from middle and upper income bracket depositors of Scheduled Banks to the rural and lower income group customers of the Co-operative and Post Office Savings Banks.

Deposits of Co-operative Banks, Post Office Savings Bank, and Scheduled Banks.

(In lakhs of Rupees.)

	*Co-operative Banks.	Post Office Savings Bank.	Total.	Scheduled Banks.
1946	57,80	1,15,05	1,72,85	10,32,46
1952	1,01,65	1,09,81	3,05,46	8,60,12
Increase or Decrease	+47,85	+84,76	+1,32,61	-1,72,34

*Figures are for 1945-46 and 1951-52.

But there has been hardly much change in the relative incidence of taxation between the rural and the urban areas or between the middle income earners and the workers.

The Chamber may mention that while the level of income of the middle class people have gone up by not more than 200 per cent. during recent years, their cost of living has increased by roughly 400 per cent., thus leaving hardly any margin of savings for this class of people, whereas the average annual earning of a worker in West Bengal increased nearly 5 times since 1939.

Question 15.—Burden of the Cost of Tax Compliance.

It is widely complained that the operational cost of tax compliance resulting from onerous requirements as to maintenance of records, returns, and accounts and the methods and processes of assessment and collection have affected the tax payers morale. Avoidance of tax is reported to have resulted from the rigours and complexities of tax compliance. The procedure and machinery for receiving and reviewing appeals have also been considered to be costly. For all these reasons, in respect of several taxes particularly Income-tax and Sales tax, it is stated that the cost of compliance materially adds to the financial and psychological burdens

of the taxes involving wastage of time and energy. In respect of Income-tax (including Corporation tax) assessments are often considered to be capricious and appeals have to be preferred and with success; but then too, the expenses of such winning appeals are not allowed. Income-tax assessments particularly in respect of trades, professions, etc., are usually very long-drawn, involving considerable costs to the assessee. The Procedure, Rules and Regulations are cumbrous with the result that costly experts have to be employed, and the tax payers participation in the assessment processes are difficult. The procedure adopted for assessment of custom duties sometimes adds to the risk of business as uncertainties and delays are involved in classification of the items for the purpose of assessment, and refund of excise duties have also affected exports. In the administration of Income-tax, Sales-tax, and Customs duties, economic and trade considerations are often neglected and too much legalistic and accounting attitudes are taken.

Question 16.—Benefits for public expenditure *vis-a-vis* tax burden.

The pattern of public expenditure and the benefits that accrues from such expenditures do materially affect the burden of taxation and the taxable capacity. For example, if the security, administrative and debt services take the bulk of Government expenditure and the people are left to make their own provisions, for the welfare services and social security provisions, and if the industries are called upon to bear more and more the responsibilities for such services to the industrial labour, then the citizens and the businessmen should be left with a larger share of their current incomes. It appears from the report of the National Income Committee's findings that the aggregate public expenditure in the total national expenditure constitutes roughly 9 per cent. to 10 per cent. of which some 2 per cent. is spent on Defence, nearly 1 per cent. on administrative capital expenditure and the balance of a little over 6 per cent. on current Governmental expenditure including Civil Administration, costs of collection of revenue, debt services, etc.

No doubt, during the recent years, there has been a tendency to increase the share of welfare services in the total Governmental expenditure but still, it seems that at the present stage of development, and the people's psychology, the level of public expenditure cannot be raised to any large extent. In Australia, the burden of the welfare tax that has been imposed during recent years, or the burden of the increased indirect taxes in the U.K. are not considered to be very heavy because of the free services that are provided by the State in respect of education, medical aid, unemployment, old age provisions, food subsidies, at standards acceptable to the tax payers. In the Indian taxation, when it is found that such measures are not possible to be provided at present, except for the relatively poorer section of the society who do not pay much tax, the level of taxation should be kept at a low percentage of the National Income so that the provisions can be made by the tax paying people themselves in these fields of social securities. The present beneficiaries of the welfare services of the State can be made to contribute something to the Government only through indirect taxes. It should be noted that in an under-developed country, heavy expenditures sustained by taxation, undermines the incentives for work and therefore even if some benefits are included in the public expenditure of India today, then too, the burden of the taxes that would be required to sustain such a policy may affect the productive efforts of the country.

Question 17.—Tax Burden on Particular Industry or Occupation.

It appears that the tax burden is generally heavy on all industries. There is a feeling, however, that the burden on industries like Cotton Textiles, Coal, Jute and on Commercial services like Stock Brokers' Firms, Agency Houses, etc., has been weighing too heavy during recent years. Regarding Cotton Textile Industry, it has been estimated that the total burden of tax at various levels of Government on the Cotton Textiles has been roughly Rs. 50 crores in the shape of Import duty on raw cotton, Excise duty, Cess on Mill-made cloth, Sales-tax and Income-taxes. A pair of Dhuty for which the Mill price is Rs. 12 has to bear an Excise Duty and Sales Tax of Rs. 3 and such additions are proving too heavy. In respect of Coal and Sugar, the aggregate burden of income-taxes, Cesses and Excises, have also been considered to be very high in relation to the present trends in the prices and profit in those industries. In respect of Cotton Textiles there is heavy consumers' resistance and it is hardly possible for the industry to shift the burden of Excise duty to the consumers and the industry also can hardly bear it. In respect of certain other industries which have to depend principally on foreign markets like, Jute and Vegetable Oils Industry, the Export Duties prove to be very high and burdensome for the industries. It has been stated that export duty on Linseed and other Vegetable Oils have sometimes worked out to be 40 per cent. of the value of the

product. The burden on the Jute Industry is indicated by the fact that while there is full working in the Jute Mills in foreign countries, there is restriction on working hours and there is sealing of looms in Indian Jute Mills.

Generally speaking, the burden on the business, professions and trades, carried on by the Hindu Undivided Family have also been considered to be high in view of the present methods of taxation of Hindu Undivided Families.

Question 18.—Taxation *vis-a-vis* Borrowing to finance Development.

The Chamber is of the opinion that for developmental programme of the country in the public sector, greater reliance should be put on borrowings whether from within the country or from outside, than on taxation. At the present stage of development, it may not be possible to raise the necessary funds by expanding the orbit of direct taxation so as to cover a very wide section of the people, at the same time the financial position of the existing establishments does not also enable them to bear even the present burden of taxation while implementing the development programme assigned for them in the Five Year Plan. The Chamber considers that for the development programme of the public sector, attempts should be more for mobilisation of voluntary individual savings by borrowing in different forms and less for imposing involuntary savings on the community through the device of taxation. The Planning Commission observed that the public and private sectors "can well supplement each other and need not necessarily expand at the expense of the other but both must draw from the same fund of social savings". From this consideration also, when taxation is taken recourse to for development programme in the public sector, the availability of funds to the private sector gets seriously affected. For a mixed economy utilisation of current revenue secured by taxation, for the purpose of long-term investment operates against the private sector, specially when the fund of social saving is small relative to requirement.

Question 19.—Priorities in maximising the Financial Resources for Development.

For expenditure on productive development schemes more reliance should be placed on loans and not on current revenues. For non-productive developmental expenditures the economy and rationalisation in the public expenditure (both revenue and capital) should be looked upon as the first step for strengthening the developmental resources. In the next place, attempts may be made to secure larger contributions from non-tax sources, particularly Government's Commercial Undertakings. Better administration of the taxing machinery may also increase the revenues by prevention of tax avoidance and tax evasion in respect of several taxes at State levels. The resources may also be increased to a considerable extent by increase in land revenue, agricultural income-tax and introduction of small excise duties on a wider range of industries, re-adjustment of sales-tax at differential rates; introduction of salt duty and readjustment of the prohibition policy may also increase the resources of the Government. The Chamber does not feel that there is any scope of increasing the rates of existing taxes, at least so far as the major Heads are concerned.

Question 20.—Public Versus Private Sector in the Development Programme *vis-a-vis* Taxation.

The Question appears to be too broad and the views of the Chamber may be found indicated in replies to other question. It would, however, like to emphasise that the tax policy should leave sufficient incentives for enterprise and hard work and adequate portion of the social savings should be left for the private sector. For development of the public sector, borrowings, especially from foreign countries and contribution of labour and services by the individuals should be more adequately relied on. In a tax policy which may be suitable for the private sector of the economy, the following principles should be adhered to:—

- (a) The policy should not unfavourably affect the under-noted five-fold incentives:
 - (i) Incentive for enterprisers for establishing new companies or for development of new industries;
 - (ii) The incentives for those choosing to go into business for themselves rather than going in for service, which alone can maintain the vigour of the private sector in a mixed economy;
 - (iii) Incentive for existing business to expand plant and equipment and to introduce new machinery and methods;
 - (iv) Incentives for the people to invest their money savings in business undertakings;
 - (v) Incentives for the qualified personnel to assume the exacting tasks of executive and managerial positions for efficient operation of the private sector.

- (ii) The tax policy should secure the two basic conditions for the functioning of the economy of the private sector, viz., maintenance of a constant flow of venture capital into the system and provisions for keeping the level of effective demand for the goods and services at par with the progress in production.

It is generally felt that the present taxation system is unsuitable for development programme of the country on the basis of a mixed economy, because, (a) the income-tax rates are proving confiscatory at higher levels, (b) the Agricultural sector which accounts for nearly half of the National Income bears less than 19 per cent. (including land revenue) of the tax load, (c) taxation of Corporate incomes and the degree of progression at middle and higher income brackets of personal incomes affect economic propensity to risk, venture and invest, (d) while profits are heavily taxed there is inadequate scope for adjustment of losses, (e) the cumulative effect of taxation on business firms being heavy, investment is curbed, and uncertainty about the future level of taxation, especially the fear of confiscatory taxation; (f) inadequate tax concession to the middle and upper income brackets from whom mainly venture capital flows, (g) inadequate emphasis on indirect taxes for widening the coverage of taxation, (h) very low level of local taxation especially in rural areas. The Government's schemes for Sickness Insurance, Compulsory Provident Fund, etc., put additional burdens on the industries. Relief therefore is needed to have capacity to bear these burdens.

Question 21.—Tax Policy and Capital Formation.

As has already been mentioned in reply to Question No. 18 above, for the capital expenditures in the Public Sector, greater reliance should be placed on mobilisation of voluntary individual savings than on taxation. It has also been mentioned in reply to Question No. 21 how Tax policy may aid capital formation by providing a larger scope for saving and by limiting the restrictive effect of taxation on the major incentives required for capital formation.

To aid individual voluntary savings, the saving capacity of the traditional savers need be strengthened. In this context, the Chamber would like to stress that the capacity of saving for this group of savers has been seriously affected during the recent years. The burden of tax on the middle income groups ranging from say, an annual income of Rs. 15,000 to Rs. 1 lakh has been very high. It stood at 14 per cent. in 1950-51, for the group earning Rs. 15,000 to Rs. 25,000, at 24 per cent. on Group earning Rs. 25,000 to Rs. 50,000 and at 38 per cent. on those earning Rs. 50,000 to Rs. 1 lakh. The draft on those earning between Rs. 1 lakh to Rs. 2 lakhs was 49 per cent. in 1950-51, and on those earning above Rs. 2 lakhs was 86 per cent. The draft on this last Group was as high as 92 per cent. in 1947-48. Such heavy taxation coupled with high cost of living has seriously affected the capacity to save. The net balance of savings of the Corporate Bodies have also been very small in the face of heavy taxes. Secondly, whatever savings there have been, have flowed to Insurance Companies and the Banks and the major portion of such savings have to be invested in Government securities and kept in deposit with the Reserve Banks, in terms of respective Statutory provisions. The remaining small portions of the savings find their way to a limited sector of established trade and industry and therefore capital formation through newer industries and trades in the Private sector has been extremely difficult.

Firstly, the capacity of the investors needs to be increased by tax relief. Secondly, larger measure of incentives may be offered to the potential investors in the form of exemption of investments in approved Industrial Shares from taxation in the years of investments. A limit can be placed on the quantum of such relief in terms of percentages of income so invested. A larger measure of tax reliefs to new industries and approved old industries, in order to enable them to offer quicker and higher returns to the investors, along with some tax relief on the dividends received from such industrial shares in the hands of the shareholders of such Companies, may also help capital formation. By such measures the incentives for the investors class can be increased by re-adjustment of Income-tax and Corporation tax.

The Chamber would also like to mention that Life Assurance is decidedly a good channel through which the act of saving can be made more attractive. For this purpose, the limit upto which Insurance premia paid by the insured assesses are allowed for income-tax rebate should be increased. Special tax treatment of Life Assurance Companies can also make Life Assurance cheaper and more attractive. The lower income Groups and Workers can be touched through Life Assurance. The savings mobilised through Life Assurance Companies would find their way both in Government Securities and other approved Securities.

Capital formation through differential taxation of distributed and undistributed profits of Companies in

the private Sector would also be a desirable policy, as has been recommended by the Planning Commission.

Question 22.—Decline in Capital Formation.

As has been previously observed capital formation in the private sector has been affected during the last four or five years due to various disincentives against saving and investment. The high cost of living and steep rates of taxation affected the saving capacity of the middle and upper income Groups who had traditionally the maximum propensity to save. The high rate of personal income tax seriously affected the incentives for further work and earning income among the individuals, as any additional income did not leave for them sufficient net income after taxation. The talks of nationalisation in the first flush of Independence, Business Profits Tax, Capital Gains Tax, various types of regulations and threats of further regulations, limitations on dividends and similar other measures affected the incentives for saving. The low rate of depreciation allowance and high costs involved in replacements coupled with the application of Section 23A of the Income-tax Act, depressed the formation of physical capital through Corporate savings.

The Chamber is not in possession of any authoritative evidence as to the rate of private capital formation for the country during the recent years, and during the pre-war period. But one non-official estimate which was quoted by the Fiscal Commission indicated that there were definite dis-savings in the year 1947-48, and there was also a negligible rate of saving at 1.4 per cent. of the National Income during 1948-49, and the Fiscal Commission also felt no hesitation to conclude that the rate of private capital formation in the country had declined. The decline would also be clear from the comparison that according to the computation of Dr. Colin Clarke, while the rate of investment constituted about 7 per cent. of the National Income in India throughout the period 1919 to 1938, the Planning Commission have estimated the rate of savings in the community to be only 5 per cent. of the National Income in 1950-51. Some idea about capital formation in the private sector through Joint Stock Companies can also be had from the changes in the paid-up capital of Joint Stock Companies in India. The total paid-up capital of Joint Stock Companies was Rs. 123 crores in 1919-20, it increased to Rs. 261 crores in 1929-30, to Rs. 304 crores in 1939-40 and it stood at Rs. 628 crores in 1948-49. The growth of capital during the second decade was thus of the order of Rs. 138 crores, and it declined to Rs. 43 crores during the third decade, while during the forties the increase was to the tune of Rs. 324 crores. Taking into consideration the fall in the value of the Rupee, to roughly one-third, the real growth of paid-up capital during the fourth decade can be estimated to be of the order of Rs. 108 crores as compared to Rs. 138 crores during the second decade. The third decade was primarily a decade of world wide depression. The injection of new capital into Joint Stock Companies during recent years has been very inadequate compared to the needs.

The Chamber feels that there has been considerable shift during recent years in the capacity and incentives to save both among the individuals and the Corporate Bodies. As has been pointed out, due to factors indicated above, and also mentioned in reply to Question No. 21, the capacity and incentive for the traditional savers in making their contributions to the capital formation declined during recent years. The capacity of the Corporate Bodies also declined. The middle and upper income Groups have been the traditional savers and the records of deposits in the Post Office Savings Banks and Co-operative Banks when compared with those of the Scheduled Banks, would indicate that there has been shift in the volume of saving towards the rural areas and also toward the lower income Groups. Such shifts in incomes have also been reflected in larger demands for consumption goods. The nature of demands of different classes of people, both in terms of quality and quantity, which the business men daily experience, definitely point to a shift in income.

Question 23.—Tax Relief in Middle Income Group and Savings.

The Chamber feels that tax relief in the income groups liable to be taxed at the maximum rate of personal income tax may substantially assist the growth of saving in the community. Larger allowances for insurance premia and allowance for investments in approved industrial shares and in approved bonds, may considerably contribute to capital formation from the current incomes of the middle income group. It has been shewn in a recent study that nearly four-fifths of the shares in Indian Public Companies are held by middle income groups.

Question 24.—Planning Commission's Estimate of Capital Formation.

The Chamber is not clear whether it would be possible to divert fifty per cent. of the additional out-

put to investment each year after 1956-57 as envisaged by the Planning Commission. It, however, feels that if the adjustments indicated in reply to previous Questions are adopted immediately, then the capital formation in the private sector may be considerably increased.

Question 25.—Regulation of Consumption for Releasing Larger Resources for Development.

The Chamber does not feel confident that much regulation of consumption standards is desirable, because it is found that most of the consumption group industries are already facing the problem of extreme buyers' resistance. The absorption capacity in the country is proving inadequate for the programmed development. Secondly, the Chamber is not also clear whether tax measures would be appropriate for such regulation of consumption. The Planning Commission also make significant observation in this regard when they say that "direct taxation of the rich is likely to impinge more on their savings than on their consumption". It is felt that direct taxes on the rich would be non-effective for the purpose of regulating consumption. Appropriate measures for a higher level of indirect taxes may achieve the purpose to some extent. While it is felt that much tightening of the belt may not be possible for the majority of the people, some result may be achieved if systems of deferred payments of bonuses to wage earners, and provisions similar to it are adopted for certain middle income groups on whom the burden of direct tax may be lightened.

Question 26.—Tax Policy vis-a-vis Efficiency of the Productive System.

The major incentives on which the vigour of a productive system, particularly in the private sector, depend, have been indicated by the Chamber in reply to Question No. 20. In brief, these include the incentives for entrepreneurs to undertake ventures, scope and incentives for expansion, incentives for investors, and incentives for managerial personnel. The maintenance of a constant flow of venture capital into the system is one of the essential pre-requisites for maintaining the vigour of a productive system based on mixed economy. The tax policy can influence these incentives and can thereby promote the efficiency of the productive system. The efficiency of a productive system also depends to a large extent on the scope for modernisation of plants and machines, and for undertaking the rationalisation of industries. So, by adjustment of the tax policy the industries can be provided with larger scope for ploughing back of their profits for needed replacements and modernisations and thereby to improve the efficiency.

For optimum utilisation of money, material and machines, in the productive system, loads of taxation on each of these factors can largely affect the efficiency of the productive system. The tax on the money that flows to the productive system should be lower than on that which flows to current consumption, and thereby the productive system may be helped. In respect of import duties, and other State taxes, the raw materials should be taxed at a lower level, and all manner of double taxation at Central and State levels of such raw materials of industries should be lowered. For example, if the same raw cotton is subjected to import duty, and then again to sales tax, then the cost on raw materials gets higher and brings in rigidity in the cost-price structure. The import duty on capital goods and machinery needs also to be kept very low for promoting efficiency by modernisation of plants and machinery at relatively cheaper costs. Tax allowances for rationalisation may also help the productive efficiency of the industries.

As has already been pointed out high rates of personal income-tax at middle income brackets affects the incentives for work among the Business Executives and Professional Experts, who also largely determine the efficiency of the productive system.

The multiplicity of the taxes in India has subjected the flow of trade and income to a number of taxes, the cumulative effect of which cannot be easily measured, though can be felt by those having experience of trade. For example, a pair of Dhuty which may be priced by the Mill at Rs. 12 per pair in Bombay, would have to bear a little more than Rs. 3 by way of Central Excise Duty, Bombay Sales Tax and West Bengal Sales Tax.

The lack of uniformity from State to State of various taxes, particularly Sales-tax, have affected the free flow of trade among the different parts of the country and has in that way affected the productive efficiency of the economy. The widely varying tax load in the different States, as has been pointed out before, has significant effect on the channelling of investments to different parts of the country. Private capital must have a tendency to flow towards those areas where the aggregate tax load, as also the complexities of the taxes, are less.

As to rationalisation of the country's tax structure to arrest this diversionary effect of taxation, the Cham-

ber's opinion would be indicated from the replies in the subsequent Questions. At this place it may be mentioned that although complete uniformity may not be possible in a vast country like India organised on a Federal idea, much greater uniformity can be secured by the constitution of something like a Board of Inter-State Commerce and Revenue which Body may, *inter alia*, be entrusted with the work of keeping close watch on the undesirable effect of divergent taxes on the allocation of resources. The State Governments should come to some understanding about mutual consultation through such a Board, in the interest of the economy as a whole. Some other tax adjustments needed to invigorate the productive system in the private sector are indicated under Question No. 20.

Questions 27 and 28.—Taxation to Secure Order of Priorities in Development Programme.

The Chamber is generally sceptical about the use of taxation as a gear for economic control. It feels that there are obvious limitations of a tax policy to do the job, though every tax must have some economic effect. The Chamber would therefore mention that the desired order of priorities in the Development Programme should be attempted to be secured by more direct means than taxation. Special tax treatment of new industrial undertakings generally, and of those industries for which programmes of development have been drawn up would however be justified on the principle of social expediency. Some additional incentives may be provided by tax concession to investors in such industrial undertakings. Such tax adjustments would be only adjuncts to aid the priorities decided otherwise.

Question 29.—Scope and Efficacy of Tax Policy vis-a-vis Monetary Policy and Direct Controls.

Tax policy is only one aspect of the general Fiscal Policy comprised of Budgetary policy, Expenditure and Investment Policy, Borrowing Policy and Debt management policy. The whole Fiscal Policy again requires to be co-ordinated with the Monetary policy involving credit policy, stock market policy, banking policy, and the like. The monetary policy, and direct controls in the field of investment, regulation of industries, regulation of foreign exchange, regulation of foreign trade, etc., are likely to be more efficacious than a tax policy. A tax can be effective only in coordination with other facets of fiscal, monetary, banking and general economic policy.

Questions 30 and 31.—Taxation and Reduction of Inequalities.

The urge for reduction of inequality is appreciated by the enlightened Business Community. The Planning Commission observes that "there is need for balancing the advantages of greater equality of income and wealth against the disadvantages of a possible fall in private savings and capital formation". The Chamber would like to emphasise that relative to the present stage of development the taxation during the last few years and other measures in respect of wages, labour welfare, etc., have brought about significant reductions in respect of inequality of income. So far as taxation is concerned it has over-reached its limits in reducing inequality. It has affected the taxable capacity of the community. The inequality that existed for ages in the country has no prospect of becoming wider in the present context of things. But the Chamber must emphasise that any attempt to increase the pace of reduction in the inequality may reduce the taxable capacity to an undesirable limit. Capital resources are essential for production of income and re-distribution of an inadequate quantum of National Income means only a shift of income to those sections of the community who possess the highest propensity to consume. The Chamber thinks that reduction in the inequality is bound to gradually come about in the process of development programmed for the country.

The Chamber would also like to mention that the newer principles for regulation of wages, salaries, etc., have made the use of taxation for increasing the equality or reducing the inequality unnecessary. There are many direct ways for it and greater degree of economic equality can come only with greater increase in the National Income for which incentives to capital formation must be maintained, at the present stage among the traditional savers' class.

Question 32.—Public Expenditure for achieving Equality of Income.

No doubt, heavy public expenditure may apparently achieve some amount of equality of income. If larger measures of welfare services are adopted out of such public expenditures, then the bulk of the benefits accruing to the lower income groups may bring about a greater measure of economic equality. But when such heavy public expenditures are sustained by high level of taxation, then in a mixed economy such taxation tends towards inflation because the incentives for hard work, investment and production are likely to get affected. Thus the supply of goods and services are likely to fall short of the money supply with the result

that inflation sets in with its resultant effect on the entire economy. Continuous inflation again may bring about a different pattern of inequality. In an underdeveloped economy like that of India heavy public expenditure in non-productive lines can hardly have any effect on reduction of inequality.

Question 33.—Tax Policy and Foreign Investment in India.

The Chamber does not propose to make any suggestion in this regard.

Question 34.—New Taxes.

(a) and (b): *Estate and Succession Duty.*

Regarding Chamber's views on Succession and Estate Duties, please refer to the Answers to Question Nos. 101 and 102. The Parliament has already proceeded with the legislation. The Chamber still maintains that it has been inopportune in the very first stage of development.

(c) and (d): *Terminal Tax and Taxes on Railway Freights.*

Regarding taxes on Railway fares and freights, and Terminal Taxes, the Chamber is of opinion that in the present rates structure of the Indian Railways there is already a tax element in so far as monopoly freights charged do not seem to be justified. This would also be clear from the fact that every year there is heavy surplus in the Indian Railways and a portion of it also goes to the general revenues of the Government. Secondly already the Railway Freights have exceeded the level which the traffic can bear. There is therefore no justification for additional taxes on Railway fares and freights. Moreover, the Indian Railway freights having already exceeded the limit of what the traffic can bear any addition is likely to affect the yield of freight itself.

(e) With the Act for regulation of Futures Market and with possible legislation for regulation of Stock Exchanges, the functioning of these essential adjuncts of the Private Enterprise System likely to be impeded. These should not therefore be further burdened with a tax load. The flow of credit would also be affected.

(f) The Newspapers being the principal vehicle for public opinion, and the prices of newspapers being already very high, taxation of the sale or purchase of newspapers may not be desirable and feasible at the present moment. A tax on advertisements would add to the business costs and the Chamber is not in favour of advertisement tax.

Question 35.—Views re : Some Possible Tax Measures.

At the present stage of capital formation, the Chamber does not consider it advisable to tax capital. On the contrary, in taxation measures it should be ensured that the capital which is the source of income is not impaired.

Regarding *Salt Duty*, the Chamber is strongly of the opinion that the duty may be reintroduced, and even a moderate rate of duty may bring roughly Rs. 10 to Rs. 12 crores to the coffers of the Government without much addition to the tax burden of any individual, as the coverage would be maximum. The Chamber is fully conscious of the political aspect of this duty but it feels that in the changed circumstances of the country and when the Governments are undertaking many welfare services, the reintroduction of the duty should be considered as justifiable. If the Government feel that the public psychology may still be affected then, the receipts from the duty may be kept earmarked for rural development or for some specifically approved social service.

About *surcharges on land revenue*, the Chamber considers that if agricultural income-tax is appropriately introduced the need for surcharge on land revenue may not be there. Moreover, such additional surcharges on land revenue would make the tax more complex.

Regarding *betterment levies*, the Planning Commission seem to consider that it may be possible in new development areas. But the Chamber feels that such betterment levies may not prove feasible at the initial stages and therefore the scope of such levies during next few years may not be very much.

About *agricultural income-tax*, the Chamber is definitely of the opinion that there is considerable scope for increasing the revenues of the States from this sources. At the present, level of Agricultural income-tax is negligible in India. The Taxation Enquiry Committee of 1924 also recommended for introduction of a progressive rate of Agricultural income-tax in case of large holders. The receipts from land revenue and Agricultural income-tax now constitute less than 10 per cent. of the total public revenues at all levels and the share of Agricultural income-tax in the revenues of the States works out to roughly 1 per cent. only.

About *social security taxes*, the Chamber would like to point out that in a way, a section of Indian indus-

tries has already been put under this tax in so far as compulsory Provident Fund and Sickness Insurance Schemes have been introduced enjoining upon the employers to make contributions. The Chamber is not clear whether the coverage of social security taxes can be so extended as to yield much revenue with which any acceptable measure of social security can be provided for the people in general. The basic difficulty in any social security scheme in India at the present stage is that the coverage of the beneficiaries must be too wide and the number of those who may be called upon to bear the tax would be too few. In post-war Great Britain also while some £1,500m. was spent on social services out of the total expenditure of £3,898m. in 1950-51, on specific tax as social security tax was introduced. Community services and measures of social security on considerably wide scale were provided by the Labour Government on the basis of some extension in indirect taxes.

The Chamber considers that in undue haste to realise the *policy of prohibition*, the income from State excise duties have been unduly lowered with incommensurate result on the prohibition policy. The revenue from State excise declined from Rs. 6.2 crores in Bombay in 1948-49 to Rs. 1.1 crore only in 1952-53 and in Madras the revenues from State excise was brought down to Rs. 34 lakhs only in 1952-53. The Committee do not feel that such declines really reflect the progress in the prohibition policy. The Chamber feels that while the revenues can be brought down by a Governmental decision, the habits of the people cannot be easily changed. It therefore, feels that the prohibition policy as laid down in the directive principles of the Constitution, can be better given effect to by imposing restrictive rates of duties on the liquors while at the same time those who continue to remain addicted to this vice may be made to contribute to the State coffers which money can be spent for the community's social services.

Question 36.—Levy of a tax on Unearned Increments in value of Land and other Property as a result of Public Projects of development.

The Planning Commission observe that "betterment levies, designed to draw into the Public Exchequer a proportion of the capital gains that accrue to private parties as a result of development are a recognised device for strengthening public savings". The Chamber feels that such taxation of capital gains so to say, should not be resorted to at the present moment. While such increments in value of the properties in rural areas may be considered as largely unearned, it can in no wise be looked upon as undeserved or undesirable. While such unearned accretion in value may be there, the risks and the period of waiting involved in owning such land and other properties in undeveloped areas should also be taken into consideration. Moreover, the Chamber feels that such accretions would help capital formation in the private sector. A levy on unearned increments is also likely to be administratively difficult and complex.

Question 37.—Measures for Increasing Receipts from Existing Sources.

In the opinion of the Chamber better administration of the taxing machinery may increase yield of several of the existing taxes. If better relations between the tax administrations and the tax payers can be established and the procedure of taxation can be simplified, and the load on individual assessee can be lowered in respect of certain taxes, then avoidance and evasions may be also minimised, with consequential result on the aggregate yields. By way of illustration, the Chamber may mention that in respect of several taxes like Sales-tax in West Bengal, the full tax payers' coverage does not seem to have been as yet secured with the result that the tax operates as iniquitous against those who pay the tax as also the general consumers, while the yield continues to remain relatively low.

Question 38.—What other New Sources of Taxation can you Recommend?

Please refer to the Answer to Question Nos. 34 and 35 above, regarding the Chamber's views on new sources of taxation.

Question 39.—Central Surcharge on Taxes.

Except under emergent conditions, the Chamber is not in favour of imposition of Central surcharges on the taxes or duties whether of the Central Government or of the State Governments. Regarding the surcharge on Income-tax the Chamber strongly urge for abolition of the present surcharge.

Question 40.—Limitations of the Tax Policy to cope with Inflationary and Deflationary Situations.

Basically, the Chamber is not clear about the efficacy of taxation as an instrument for meeting inflationary and deflationary situations. As has already been pointed out, tax policy is after all only one aspect of

the fiscal policy which, in its turn, cannot work without monetary policy. While thus, the tax policy cannot accomplish the tasks of combating inflation or deflation, it can to some extent be helpful in making the other antidotes effective. For such use of the taxation also, the economy and for the matter of that, the markets of the country must be sufficiently organised and the statistical measures and gauges must be well developed so that the Government may use such measures at the correct time and in the correct manner.

Under the present Indian conditions, the Chamber is particularly doubtful about the efficacy of the tax policy as an instrument for dealing with inflationary or deflationary situations. By way of illustration, the Chamber may point out that the ostensibly anti-inflationary taxation in India during recent years has been considered by many to have more affected the flow of venture capital and the country's exports, than really checking inflation. It would be found that the anti-inflationary taxation did not succeed till the monetary and credit policies could be made effective from the beginning of 1952. The Chamber would like to point out that it is always difficult to decide the limit at which taxation may just curb the inflationary excesses and may not impair business incentives. The Committee would also point out that frequent changes in taxation and tax rates, which the utilisation of the tax policy for combating short-term economic fluctuations would involve, affect business planning, and thus whatever good may be secured by such utilisation of the tax policy is more than offset by business instability that it brings forth. The time-lag between proposals and implementation of the adaptations proposed, and between tax receipts and expenditure, create uncertainty and hesitation in taking business decisions. Frequent changes in Customs Duties also generates speculative tendency in the country's foreign trade.

Question 41.—Efficacy of Different Individual Tax Measures to Combat Inflation or Deflation.

The general views of the Chamber about the efficacy of the tax fabric in combating inflationary or deflationary situations are indicated in Answers to Question No. 40 above.

At the present moment the rates of Corporate and individual income-tax are so high that even if there is a little inflation, it would be ruinous to go with the idea that such inflation can be countered by increasing such taxes still more. In this context the Chamber would like to stress that the War-time and Post-war high levels of income-tax and super-tax, and imposition of Excess Profits Tax, Business Profits Tax, and Capital Gains Tax seriously undermined the capital formation in the private sector, but had little effect in countering inflation of the War and Post-war years. The Chamber would also mention that in the course of implementation of the Five-Year Plan, a huge amount of money would be released into the economic system putting inflationary pressures on commodity prices, and deficit financing would also add to this inflationary tendency. But if taxation is to be utilised as an aid to keep such inflation under control, then the measures must be able to mop up the small funds of additional income that would be released during the Planning period among a larger number of people throughout the country. Unless mopping up of such additional incomes is possible, taxation measures as an anti-inflationary technique is bound to be non-effective. In an eagerness to apply the technique, if efforts are made only to hunt up the collective savings available in the organised businesses and if the microscopic proportion of the population who pay income-tax is only to be fleeced, then the policy would affect capital formation and incentives for work, saving and investment, while proving non-effective as a counter-inflationary measure. In the opinion of the Chamber Direct taxes are unsuitable for countering inflation, in the context of India's conditions. As the bulk of the productive instruments are operated by those who pay direct taxes, measures to lighten the tax burden on industry and trade may however, invigorate the economy.

Among indirect taxes, the adjustments in the import duties in times of goods scarcity may arrest the inflationary spiral by increasing the supply of goods in relation to the available purchasing power. The yield of the duty may also increase, thus bringing in revenue while mopping up a portion of the purchasing power in the community.

The experiences of the Chamber about the use of Export Duties in countering inflation during recent years have not been encouraging. The Chamber is doubtful about the equity and efficacy of this device to combat inflation. During 1938-39, Export duties covered only two articles, viz., jute and Rice and yielded Rs. 4 crores out of a total revenue of Rs. 42½ crores while in 1951-52, Export duties covered 10 commodities and brought nearly Rs. 50.5 crores out of a total gross revenue of Rs. 145 crores. It has been claimed that by the device of levying Export duties, the taxation policy has contri-

buted to combat inflation in India. The Chamber, however, feels that the export trade of the country has been to a large extent damaged by such a policy because of the inevitable time-lag involved in making appropriate adaptations. The Chamber feels that there is inherent limitations in using Export Duty for such purposes. In its opinion the Government should relieve the country's export trade from the strangle-hold of Export Duties.

The Excise and Sales taxes virtually impinge on consumption. A judicious use of these taxes with timely adaptations may influence inflationary or deflationary trends to some extent. For example, the reduction or abolition of Excise Duty on mill-made cloth may contribute to bring down prices of cotton textiles at present. The levy of Salt Duty and imposition and/or a slight increase in Excise Duties on those goods which are consumed or used by almost the entire population may contribute to mop up a portion of the additional money that has flowed and would flow to the workers, peasants and other income-tax exempted categories of people, and thus some check may be put on the inflationary pressure of the developmental expenditure. But downward re-adjustments are necessary in respect of some products like cotton textiles where the prices are facing consumers resistance.

About Sales Tax, the Chamber is of the opinion that the revenue urge of the State Governments have already made the tax extremely complex and restrictive of trade, and therefore there should be no attempt to add yet another complex function to it.

Question 42.—To what extent is it possible to increase the inherent capacity of the tax system to counteract inflation or deflation?

The Chamber's views regarding the scope and inherent limitations of tax policy as an instrument to deal with inflation and deflation are indicated in replies to Question Nos. 40 and 41 above. Moreover, as the Chamber has observed at the very outset (Reply to Question No. 1), it is not in favour of such non-fiscal use of the tax policy. In other countries with much developed and organised economies, and where the coverage of direct taxes is fairly high, there may be some scope for utilising taxation as a contributor to to counter inflation or deflation. But in those countries also tax policy is looked upon in such circumstances only as an adjunct of other policies, monetary and non-monetary. In the context of things in India there should be still less reliance on tax policy for such purposes. The question of increasing the inherent capacity of the tax system, by itself to deal with inflation or deflation, seems to be therefore premature. In times of money inflation the Government should go in for mobilising small savings, may float loans, etc., for pumping out the additional purchasing power. In times of deflation on the other hand more money may be pumped in by various devices, like re-payment of loans, drawing upon the cash balances of the Government, cheaper credit policy, etc.

Question 43.—Public Expenditure *vis-à-vis* Inflation or Deflation.

Public Expenditure programme can substantially influence the inflationary or deflationary situations. But the pattern of expenditure would be significant. For example, the high level of public expenditure, undertaken by the Government under the Five-Year Plan, being principally of long-term capital nature and partly of non-productive welfare category, cannot but have an inflationary pressure on the economy, and deficit financing would add to this pressure. If this high level of expenditure is to be financed out of current revenues secured principally by direct or indirect taxation of those who constitute the backbone of the private sector of the economy, then that may mean crippling of the economy, inspite of a high level of public expenditure, as the private industry and trade responsible for the supply of the goods and services would be crippled. Stagnancy of the economy with growing unemployment, along with an inflationary trend may thus result from such a pattern and level of public expenditure backed up by such a scheme of financing. For curbing inflationary pressure, adjustments in public expenditure pattern and slowing down its tempo, and efforts to mobilise small savings may be more efficacious and effective than any other instrument.

In times of deflation or depression, the policy of undertaking programmes of public expenditure on projects like Road construction, Irrigation, Housing and other similar types of Public works, was effectively adopted in many countries during the depression days of the thirties. Increase in public expenditure has been resorted to for invigorating the economy during those days. But it may be worth considering, under the Indian conditions, whether increase in public expenditure or tax reduction would be desirable for meeting a deflationary situation or a depression. In the Indian Economy private sector provides the people with the bulk of the employment opportunities, and tax reductions are likely to more effectively invigorate the

economy by means of larger and wider investments, than an increase in public expenditure by an equal amount. Such tax reductions would directly influence investment incentives, while an increase in public expenditure in non-productive lines is likely to increase consumption incentives. It has however to be noted that some increase in public expenditure in selective lines of public works of high utility may be also necessary and desirable. In times of deflation therefore a combined policy of increased public expenditure and tax reduction may be most effective.

Question 44.—Using tax policy to deal with the effect of rising or falling prices on particular groups of tax payers or sectors of the economy.

As already explained in the replies to several previous questions, the Chamber is not generally in favour of relying on the tax policy to deal with the effect of price fluctuations. It is therefore of the opinion that the tax adjustments are not suitable instruments to counter the effect of short-term price changes on the different sections of the people. Monetary and credit measures and public expenditure policies are better instruments. But tax adjustments along with other measures may be necessary if the rise or fall in prices persist over a considerable period of time and exhibits trends for stabilisation at higher or lower levels.

Question 45.—Present Phase of Economy and Needed Adjustments.

So far as the industrial products are concerned, there is deflationary trend in the market. Generally speaking, the absorption capacity within the country is falling short of the expansions achieved in the field of industrial production. In the international prices of the major counters of India's export trade, there is also a strong deflationary trend. There are rigidities, however, in the cost-price structure, particularly of the industrial products, including the rigidity provided by the load of taxation. The high level of public expenditure, which is predominantly of a capital or non-productive nature, is providing an element of inflationary pressure in several sectors, particularly in respect of food articles, and this is likely to continue. A layer of prosperity among the peasants and workers may sustain that pressure. In respect of business profit, which is very strategic in determining the volume of new investments and economic expansion on the basis of a mixed economy, the declining trend has gone to the limit of almost becoming dis-incentive. The rate of new investment or expansion in the private sector, is proving to be too low to provide gainful employment to the growing population. The tax adjustments, therefore, are to be made on the canvas of these trends.

For providing wider opportunities for employment, the tempo of new investments over wider fields of business activities may be increased by a revision of the public expenditure programme, and by providing wider scope and stronger incentives to those sections of the community who traditionally possess the propensities to save and invest. By such expansion of investments the volume of employment and production can be increased with a better adjustment between the rates of expansion and absorption of the goods produced.

The adjustments in the fields of taxation which the Chamber has in view have been indicated in the course of replies given to the previous Questions and would be given in more concrete terms in its replies to other parts of the Questionnaire.

PART II—DIRECT TAXES

Question 46.—Determination of 'residence'.

In the opinion of the Chamber, the alternative test of residence, viz., (i) location of control or management, or (ii) relation between extra-territorial and inter-territorial incomes as provided in Section 4A(C), should be guarded with some proviso so as to secure that a foreign company before getting the privilege of set-off of any foreign loss, in any year it becomes resident (because of more than 50 per cent. income in India), should bring at least an equal amount of foreign profits in India in subsequent years, when it becomes non-resident because of more than 50 per cent. income abroad. The recommendations of the Income-tax Investigation Commission in para. 48 of their Report appears to be pertinent if the present alternative test of residence of Companies is to be continued. Broadly speaking, the Chamber would suggest for introduction of such tests of residence as may secure to India the tax on the entire income that arise in India and there should be no charge on foreign profits.

The Chamber is of the opinion that the special category described as "not ordinarily resident" in Section 4B should be abolished as was recommended by the Income-tax Investigation Commission. Some special provision for the foreign technical personnel who may be employed in India, at the present phase of the country's economic development, may however, be made.

Question 47.—Definition of Income.

In the opinion of the Committee, there is no way out than to leave the "definition" as of a very general nature as in Section 2(6C). No exhaustive definition seems to be feasible and the definitions attempted to be given in certain foreign laws, as in the Income-tax Laws of Canadian Provinces, are of a very broad nature though very long.

The Chamber would, however, like to explain that the concepts of revenue incomes and expenses in income-tax accounting should not be very different from those in business accounting. With this end in view, some principles should be enunciated in the Act itself. In this connection the Chamber may invite the attention of the Commission to the principles enunciated in respect of income in the case of the Commissioner of Income-tax *versus* Messrs. Shaw Wallace & Co. where the following observation is made:—

"Income in this Act connects a periodical monetary return coming in with some sort of regularity or expected regularity, from different sources. The source is not necessarily one which is expected to be continuously productive, but it must be one whose object is the production of a definite return, excluding anything in the nature of a mere wind-fall."

The exclusions made in Section 4(3) (vii) may be further clarified so that no receipt which is considered to be of a capital nature in business accounting may be attempted to be included within income for the purpose of taxation.

Question 48.—Heads for Income-tax: Taxation of Capital Gains.

The heads of income chargeable to income-tax as mentioned in Section 6 of the Income-tax Act seems to be comprehensive. Incidentally, the Chamber would suggest that "Dividend" should be shown as a head along with "Interest on Securities" in Section 6 of the Act against head No (ii) instead of being put under head number (v), "Income From Other Sources".

The Committee would also like to mention that in the Finance Act of 1953, it has been prescribed that speculative losses can be set off only against speculative gains. The underlying principle seems to confirm the view of the Chamber that an income in order to be charged under standard income-tax should be regular and recurring. In the opinion of the Chamber, if speculative losses are not allowed to be set off against regular and recurring incomes, speculative gains or incomes should not also be included within the normal income for charging income-tax. Such irregular and non-recurring gains or incomes may be treated separately for taxation.

The Chamber is definitely opposed to the taxation of capital gains at the present stage of economic development of India. Taxation of capital gains is bound to seriously affect risk taking incentives and ventures and would thus impede capital formation. It is administratively complex and the yield may not warrant for taking recourse to such a measure in peacetime economy. With the introduction of the Estate Duty all capital gains would be taxed on the death of the last holder of the property and therefore a separate capital gains tax would be still more undesirable.

Question 49.—Taxation of Profit accruing or arising abroad on their repatriation to India.

The question mentions only the issue of taxation of foreign incomes on repatriation. The Chamber would like to emphasise that foreign incomes of the residents should be completely exempt from Indian income-tax.

The Chamber would also stress that when such foreign incomes are repatriated, it should be exempt fully from income-tax without conditions being imposed on the manner of investment of such repatriated foreign earnings and savings.

Such a procedure would encourage the Indian nationals to take up business in foreign countries and repatriate their incomes for investment in India. Such repatriated foreign earnings and savings should be allowed to flow in the private sector without hindrance. The income that would arise out of such investments would naturally be taxed in subsequent years and therefore such repatriations should be encouraged.

Question 50.—Definition of Dividend.

It appears that no change is needed in the definition of 'dividend' in relation to bonus shares. The bonus shares release no asset of the Company, nor do such shares add to the liquid spending power in the hands of the recipients. Secondly, the issue of bonus shares affects the value of the existing shares and therefore, if the bonus shares are to be taxed as dividends, the depletion in the value of the existing shares would also have to be allowed. But such adjustment would

be virtually impractical. The issue of bonus shares is a time-honoured method for capitalisation of the past savings and therefore it should not be impeded by taxation, particularly at a time when capital formation and need for speedy development are considered urgent and vital in the country.

Question 51.—Taxability of non-residents through their business connections in India: Sections 42 and 43 of Income-tax Act.

The Chamber feels that the present provisions of Section 42 and 43 put the importers in India in an uncertain position, because of the interpretations put to these provisions in administering these. The sections should be suitably modified so as to secure the following:—

(a) An Importer, or even an Agent or an employee in India of a non-resident foreign trader or manufacturer, should not necessarily be liable to be assessed on behalf of the foreign Suppliers or the Principal. The general qualifications of an Agent in order to be assessed in a representative capacity, should be stated in the Act itself.

An Agent in order to be selected as a representative assessee should have the general authority to negotiate and conclude contracts on behalf of the non-resident Principal, or should be in possession of a stock of merchandise for the purpose of fulfilling orders. There should not be any question of such representative taxation in Principal to Principal contract, or when an independent Commission Agent or a Broker or a Custodian acting in the ordinary course of business does business with a foreign trader.

(b) While the Chamber agrees that the entire profit arising out of trading in India, should be taxed, it should be categorically ensured that in eagerness to tax such profits, no profit which may arise out of trade with India (but not in India), may be subjected to Income-tax in India. For example, when goods are sent by a foreign Principal to his Agent in India, the entire profit should not be treated as profit arising in India at the time of sale here. The manufacturer's profit should be separated from the trader's profit and only the latter should be taxed in India. The Chamber understands that specific provisions exist in the Australian law in this regard and those may be examined by the Commission.

Unless these provisions are effectively secured, both in the law and in the administration, the position of the Indian Importers remains uncertain and the foreign exporters may insulate themselves by insisting on sending goods at F. O. B. prices; and the agency and consignment business become difficult.

In this connection, the Chamber would like to observe that it is opposed to recommendation No. 6 made in paragraph 44 by the Income-tax Investigation Commission as to the method of assessment of the non-resident foreign trader by selecting one resident representative as responsible for the entire tax liability of such a non-resident. If a foreign trader has more than one qualified Agent in India, it should not lie on the Income-tax Officer to select any one of such representatives for the entire tax liability of the foreign Principal.

Question 52.—Definition of Agricultural Income to avoid Double Taxation.

The definition of agricultural income as given in Section 2(1) would require modification so as to avoid the scope of double taxation in respect of incomes and dividends of Agricultural, Plantation and Forest Companies. In the opinion of the Chamber, the Act should categorically declare that if the income from the Plantation Companies and Companies engaged in forestry be agricultural income then the dividends paid out of such income should also be considered as of the same nature as the total income of the Company. It should be conceded that if an income is agricultural in the hand of the Company, then the dividend declared out of such income should also be considered agricultural in the hand of the recipient of the dividend.

The Chamber would, however, prefer integration of agricultural and non-agricultural incomes for income-tax purpose and in that case, the issue regarding dividends declared by Agricultural Companies and Forest Companies would get resolved.

Question 53.—Integration of Agricultural Income with non-Agricultural income for rate purpose.

As income from all other sources are integrated for the purpose of Income-tax, there seems to be no particular economic justification against integration of money income arising from agricultural sources, with those arising from other sources for the purpose of income-tax. In other countries also, such integration is made.

If, however, such complete integration is not considered feasible as a matter of expedience, the Chamber

would *alternatively* suggest that at least on consideration of "ability to pay", net agricultural income, after deduction of all expenses incurred for earning that income and the agricultural tax paid on such income, should be integrated with non-agricultural income for determining the rate of income-tax under the Central Act.

The Chamber does not visualise much difficulty in such integration on constitutional grounds, but because Agricultural income-tax has not been introduced in the majority of the Indian States integration of the two incomes for rating of the non-agricultural income need be preceded by the introduction of Agricultural income-tax in all the States.

Question 54.—Abolition of distinction between Agricultural income and non-Agricultural income and change of the Constitution.

If the first alternative suggested in reply to Q. No. 53 above, be accepted then that would automatically involve complete centralisation.

Even if the two incomes are kept separate, and Agricultural income is taken into consideration only for the purpose of rating, as suggested in reply to Q. 54 above, then also the Chamber would strongly favour the centralisation of the administration of agricultural income-tax for and on behalf of the States. With this end in view, the Constitution should be changed, or even in terms of the present Constitution, the State Governments should empower the Centre to levy a uniform agricultural income-tax for the allocation among the States on the basis of the collections.

Question 55.—Treatment of irregular and fluctuating incomes.

In the opinion of the Chamber, the present treatment of irregular and fluctuating incomes require modification so as to specifically provide for averaging of all irregular and fluctuating incomes arising from business, profession or vocation, over a number of years.

The incomes arising out of recognised speculative transactions should particularly be treated as fluctuating incomes for the purpose of such averaging. Risk investments yield uncertain and irregular incomes and averaging of such incomes for tax purposes would promote investment incentives.

Secondly, in case of lumpsum receipts, at intervals, these should not be taxed in one year as the income of that year in which these are received. Similarly, profits of contractors can be calculated only in the year of completion of the contract and so such profits should not be considered as income of that particular year but should be spread over the period involved.

Such spreading technique is being worked out under the Federal Income-tax law of the U. S. A. in respect of incomes of authors, inventors, lawyers, etc., who work for long for no or little income and then receive large incomes and then again may have to wait for long. Prorate adjustments are allowed over the earning period. This principle has also been introduced in the Indian Income-tax law by the Finance Act of 1953 which makes provisions for giving relief to Authors, Painters, etc. The Chamber would suggest the extension of the principle of averaging and spreading in respect of dividends and all other fluctuating incomes which are received at intervals.

In this connection it may be mentioned that such averaging technique existed in certain States of the U.S.A. (like Wisconsin) till 1934 where the fluctuating incomes were taxed on the basis of "three year moving average"; the tax payer paid a tax each year on his average income of the taxable year and the two previous years. In the Depression of the thirties, it was given up, being burdensome on the assessee. But the difficulty is not insurmountable.

The scheme may be that the tax-payer would pay every year on the income of the taxable year, but at the end of a stated number of years, he would be entitled to claim refund if the taxes paid in the meantime, exceed the tax on the periodic average income by say, 10 or 15 per cent.

Question 56.—Exemption of Religious and Charitable Trusts.

All genuine Trusts with religious or charitable purpose should be given recognition in accordance with certain procedure laid down in the Act itself, and the incomes under any head of such recognised Trusts should be exempted and the relevant Section should be amended suitably. It should be ensured in the law itself that religious or charitable Trusts may not experience difficulty in obtaining recognition.

Recently, Section 4(3)(i) has been amended so as to restrict the exemption of income from business of a religious or charitable institution only in those cases where the business is carried on 'in the course of carrying out a primary purpose of the institution'. This

amendment seems to have unduly restricted the exemption envisaged in the Act previous to the present amendment. India is striving for a Welfare State, therefore if a Trust carries on business and spends the income for public welfare within the country, then such charitable trusts should be encouraged, and the income from business of such charitable trusts should be completely exempted from income-tax without the conditions imposed by the recent amendments. The emphasis should be on the purpose of expenditure and not the source of income.

It, may, however, be ensured that any foreign Trusts not carrying on any charitable work or work of public welfare in or for the benefit of India should not be exempted.

Question 57.—Taxation of Co-operative Enterprises.

The business profits of Co-operative enterprises should be brought within the purview of Income-tax (including super-tax if levied separately on other enterprises), at par with other types of enterprises. The Chamber would, however, agree to a special exemption in respect of those Societies which keep their transactions restricted within the membership of such Societies.

If a Co-operative enterprise carries on business activities with outsiders, the Chamber does not find any reason to exclude the profits of such an undertaking from income-tax, to which the joint enterprise of the shareholders of a Company and the Company itself are subjected.

Except in the case of a Tenant Co-partnership Housing Society, the Chamber is not in favour of exemption of any other type of Co-operative Housing Societies from income-tax.

Question 58.—Tax Concessions to New Industrial Undertakings.

In the opinion of the Chamber, the present tax concessions to new industrial undertakings provide inadequate incentives for investment in new enterprises. A 6 per cent. dividend allowance is by itself very small compared with the risk involved in the new enterprises and the scarcity of investment capital in the country. Secondly, this concession continues at present only for five assessment years following the year in which an assessee begins to manufacture the goods. It is to be conceded that this period is inadequate, because during such initial years, it may not be possible for the Company to declare even the exempted rate of dividend. Thirdly, in many new industrial undertakings, after the initial and extra depreciation allowances are adjusted, there remains hardly any profit for the purpose of declaring a 6 per cent. dividend. In the opinion of the Chamber therefore, the incentives sought to be provided by this exemption is not of much real benefit in promoting new industrial undertakings.

For new industrial undertakings, the Chamber would suggest the following measures:—

- (a) a 9 per cent. dividend should be exempted from income-tax and corporation tax for five years from the year in which the new undertaking starts earning profits and this dividend should be cumulative.
- (b) 25 per cent. of the investments in a new industrial undertaking should be allowed in the assessment of the investors.

The Chamber would like to emphasise that the investors may be given adequate incentives for investing in the new industrial undertakings and the period of exemption in respect of dividend should be made effective beyond the initial no-profit period.

For the suggested concessions, the period within which the new undertaking must be started should be extended upto 1960.

Question 59.—Concessional treatment of profits of foreign branches of Indian Banks.

Even if foreign incomes of resident Indian businessmen continue to be subjected to income-tax in India, on the present basis, then also profits of foreign branches of Indian banks should be given special concessions in respect of their foreign profits. The Chamber is of the opinion that in view of the special need for encouraging the opening of branches by Indian banks in the foreign countries, such concessions would be justified.

In this connection the Chamber would also emphasise that to encourage the foreign business of Indian Insurance Companies, the profits from foreign branches of such Companies should also be treated with concessions under the Indian Income-tax.

Such concessions to or even exemptions of foreign incomes of Indian Banks and Insurance Companies would materially help the foreign trade of the country and would add in invisible exports.

Question 60.—Limits of Exemption from Tax of Life Assurance premia and contribution to Provident Fund.

In the opinion of the Chamber, to aid individual voluntary savings, as also as a measure of social security, all encouragement should be provided for individuals to take out life insurance policies. The present limit of exemption for life insurance premia and Provident Fund contributions, etc., which is to the extent of one-sixth of the total income or Rs. 6,000 (for a Hindu Undivided Family Rs. 12,000) whichever is lower, requires alteration. The habit of life assurance has not developed to a large extent as yet.

While the proportion of 1/6th may continue, the upper limit of Rs. 6,000 should be raised to at least Rs. 10,000 for an individual and the same amount for each Co-partner for a Hindu Undivided Family.

The increase in the upper limit would not enable an individual to go in for over-saving as apprehended by the Income-tax Investigation Commission, because of the limitation in terms of the proportion. Such a measure may very greatly contribute to the rehabilitation of the economic conditions of the middleclass and may ensure for them a useful existence in future. Greater incentives for life assurance would also help capital formation because the premia income of life assurance companies would flow to investments, roughly half being in Government securities. Incidentally, it may be observed that to encourage life assurance, the life assurance business should also be accorded special treatment in taxation, as envisaged in Q. 32.

Question 61.—Depreciation Allowances and Replacement Assurances.

(i) The Chamber feels that there can be hardly any controversy about the need for granting larger depreciation allowances and other assurances to the industry in order to finance the considerably increased costs involved in the replacement of the assets.

The present method of computing depreciation on the basis of historical costs can, however, provide only the full value of their original cost of the assets. The problem for the older industries of India is to secure enough funds for replacing their old assets at a cost nearly 3—3½ times of the corresponding original costs. The crux of the issue seems to lie in this net differential cost involved in replacement of the older assets. The whole idea behind depreciation allowance is to safeguard impairment of capital. But the calculation of such allowance on historical basis secures only 100 per cent. of the original capital and not more than that. Special provisions are therefore needed for securing this net differential cost to the older industries. Subject to these observations, the views on the different proposals raised in the Questionnaire are as under:—

(a) The present scales of depreciation allowance on new assets should be continued in order to partially aid the increased cost of replacement of older assets but this procedure may be of temporary benefit to the industry as it is virtually the acceleration of the allowance rather than any extra allowance in the long run.

(b) The method of revaluation of existing assets is considered by many Experts as a more effective and reasonable method. But the method appears to be too complex and therefore in consideration of the needed simplicity, it may not be suitable for India immediately.

(c) The principle of treatment of the excess of replacement cost over the original cost as revenue expenditure, has been adopted by the Government in replacement in Indian Railways. In financing the Five Year Plan, also, the principle of using revenue income for capital expenditure has been adopted by the Government. The same principle may be partially applied in the case of industrial undertakings by liberally permitting a portion of the capital expenditure to be charged against the current profits. The Chamber however is not clear about the effectiveness of such a principle in a business undertaking, particularly in the present phase of declining profit or no profit. An industrial undertaking may not have profit enough against which a portion of the capital expenditure can be charged as a revenue item.

(d) In the opinion of the Chamber, an extra allowance, computed as a percentage of the block assets, should be granted to industry, to create a Rehabilitation Reserve Fund. An example may make the suggestion more clear. If Rs. 1 lakh was the original cost of a machinery and if the present replacement cost is Rs. 3 lakhs, then the net increased cost of replacement is Rs. 2 lakhs. The previous depreciation allowance and enhanced allowances introduced during the recent years, can only shorten the period of accumulating the original cost of the machinery and not this net differential cost. A special Rehabilitation allowance should be granted to create a Rehabilitation Reserve Fund of the order of this Rs. 2 lakhs within a period of say 10 or 12 years from now. If such an allowance is granted, before computation of the Income-tax (and Corpora-

tion tax), this would practically mean that the Government would be contributing only the tax leviable on the amount of such allowance and the undertaking itself would be contributing out of the current profit, the balance of the amount so funded.

In this connection the Chamber may also mention that in several other countries also special arrangements have been made for such replacement of assets, and obsolescence allowances have been specifically granted in the U.S.A. and U.K. Under the proposals made here, the industry would be contributing the larger share in the replacement and the Government would have only to forego the tax on the amount funded which may be looked upon as obsolescence allowance. For example, if Rs. 1,000 is so funded in an undertaking, in any year, then assuming the tax to be 40 per cent, the Government's contribution will be roughly Rs. 400 and the industry's contribution out of its current profits would be roughly Rs. 600, which would otherwise go in the net profit for appropriation under other heads.

(ii) In the opinion of the Chamber, assistances to the industries to replace their older and obsolete assets would benefit not only the undertaking itself but the economy as a whole, as the entire cost-price structure would then be readjusted at lower levels due to increased efficiency of production. In view of the need for larger measure of industrialisation and to put the Indian industries on a level of efficiency the special assistance that may be given to the Indian industries should be looked upon as national expenditure, the social benefit of which will be not less than the benefit of any other nation-building work.

Secondly, it should be conceded that the older industries require this special assistance for replacement of the assets because of the high prices of the plants and machines and the urgent need for replacement of these assets which were over-worked during the war years. The high prices of the products which were produced by such over-worked machinery brought in higher profits but such higher profits secured by over-working of the machines were largely appropriated by the Government by way of Excess Profits Tax and other imposts. The public resources thus were unduly strengthened out of such higher profits which were in a way, earned by the industry by almost killing the goose which lay the golden eggs. Extension of special assistance now to replace these older assets would thus be justified on all counts.

(iii) The Chamber appreciates the concern of the Commission that the special tax concessions that may be given to the industries to meet the problem of replacement finance, should be utilised for the purpose for which these are intended. This can be fully secured if it is provided that the Rehabilitation Reserve Fund as proposed in (i)(d) above, be made taxable, if it is not utilised for replacement of the assets for which it was created, within a reasonable period or stated number of years. The Chamber feels that the industries in their own interest would utilise such concessional funds.

Incidentally, the Chamber would like to mention that there is a feeling that under all the above methods that may be examined for assisting industry to finance the increased cost of replacement of assets, the shareholders would be called upon to bear the main burden of this additional replacement cost. It is apprehended that under all these schemes, the Companies shall have less capacity to offer any return to the shareholders. This may further affect the investment incentives of the private investors. Such a line of argument suggest that the Government should examine the possibility of subsidising the older industries from which large amounts have been collected by way of income-tax and super-tax during the years 1943-52. The Government heavily taxed the industries during these years when profits were earned by over-working the machines. The Government should now help these industries to replace the assets by subsidising the additional expenditure involved. Such subsidies may be related to the amount of tax paid by each undertaking during the period mentioned above (i.e., refund of tax), and may be available only if the industry replaces their plant within a stated period, say 15 years, for the purpose of modernisation of the machinery.

Question 62.—Classification of Assets for the purpose of Depreciation, Rates of Depreciation, etc.

About the question of classification of the assets, the Chamber considers that the present classification is satisfactory, excepting some modifications that may be made for making the classification more clear as in the case, say, of different types of buildings.

Regarding rates and methods of computing the allowance, complications sometimes arise, and the relevant Schedule may be scrutinised in order to avoid possible divergence of opinion in respect of interpretations and to secure that the assessments are not unduly complicated regarding the issue of computing depreciation allowances.

Question 63.—Tax concessions to encourage development of Mineral Resources.

It needs hardly to be stressed that all encouragement should be given for development of the mineral resources of India. In mining industries the expenditure on prospecting is considerable and is a very risky investment. This expenditure should therefore be considered to be the first charge on any income that may be earned on the success of the exploration. The adjustment should be spread over the estimated life of the mining concession successfully explored. Without such concessions for adjustment, it would not be feasible for Indian enterprises to undertake the prospecting of mineral resources.

In addition to such allowance for adjustment of prospecting expenditure, the mining companies should be completely exempted from income-tax during the first five years of successful working.

In the next place, depletion allowances should be granted on the wasting assets of mining companies. The mining leases suffer capital losses at the expiry of the terms of the lease and therefore depletion allowances should be granted to the mining companies for building up necessary funds for replacement of assets at the expiry of the lease and such depletion allowances should also take into consideration the amounts that may be paid by the mining companies by way of *selami* for taking out leases of either the mine proper or any other surface land for the construction of *cutchra* or *pucca* buildings. Such depletion allowance should thus be on the basis of the total cost of prospecting and original acquisition of the lease and 100 per cent. exhaustion of estimated reserve, or on the basis of full recovery of the total cost during the lease period in case of periodic leases.

In mining companies, special treatment of assets like plant and machinery may be also required because the life of such plant and machinery would be largely dependent on the life of the mine or the mining lease, and not on the normal life of the plant or the machinery itself.

In this connection it may be mentioned that in the U.S.A. under the Federal Income-tax law, as also in the U.K., depletion allowances are granted. The Chamber may also invite the attention of the Commission to the Report of the Commonwealth Committee on Taxation of Mining Industry in Australia submitted in 1951, which made exhaustive recommendations for special tax concession in mining industry. Those schemes of granting special allowances and for Sinking Fund allowance in respect of mining leases, may be examined for India also.

Question 64.—Personal and Family Allowances.

Almost all foreign countries provide for certain personal allowances and allowances for married persons and dependents, old age relief etc. In India on the other hand, wife's and children's incomes are added up to increase the load. The Chamber would strongly recommend for granting of allowances for family members and dependents on a *per capita* basis, though some limit may be put to the number of such family members and dependents for whom allowances would be granted.

Besides these family and dependent's allowances, specific provisions should be made in the Act for allowance of certain casual losses like thefts, destruction of property by fire or natural calamities.

In the opinion of the Chamber, even if such allowances are granted, for family members and dependents, there would remain justifiable allowance like say, medical expenses, etc., for which specific provisions may not be possible. For this, the first slice of exempted income may be increased to say Rs. 2,000. But the Chamber would urge for granting of specific personal allowances for family members and dependents, and in its opinion such legitimate allowances cannot be provide adequately and equitably by exempting the first slice of income. In other countries also, such allowances are given on specific basis.

In this connection the Chamber would mention that in most of the Canadian Provinces medical expenses in excess of 5 per cent. of income is allowed and dependents are defined to include son or daughter under 21 years of age or if 21 years of age, or over, but is likely to remain dependent on account of mental or physical infirmity, and a stated number of individuals who may have to be supported by the tax payer and are connected with him by blood relationship or marriage, or by formal adoption.

As to the total amount that should be allowed for each family member or dependent, a fixed amount may be laid down for each dependent and family member.

In the case of a Hindu Undivided Family, allowances should be granted on *per capita* basis on the same principle as for individuals but in respect of each Coparcener in the family.

Question 65.—Admissible expenses in Business Income.

In the opinion of the Chamber, the admissible expenses catalogued in Section 10(2) of the I. T. Act should be revised in order that the gross revenue may be charged for whole of the expenses incurred in earning the revenue and with all other expenses or losses incurred for the purpose of the business or arising out of or in connection with the conduct of the business. The Chamber understands that the Tucker Committee of the United Kingdom more or less agreed with the Institute of Chartered Accountants of England about this approach in admitting expenses for a more equitable computation of business incomes.

As far as the Committee are aware, a lot of difference of opinion arise in respect of the admissibility of an expense for income-tax purposes and it has often been complained that the profits are too much inflated by the income-tax officers for the purpose of taxation by the device of disallowing the expenses which have actually been incurred and paid out by the assessee. The result is that taxes levied over a number of years sometimes exceed the actual income received by the assessee during those years. The disallowance thus made by the I. T. Officers on various grounds are reported to have led to capital taxation, and exhaustion of the financial position of the assessee.

The Chamber therefore would urge for a clear-cut statement of principle in the Act itself that no expenditure should be disallowed, if such expenditure is charged to revenue income according to accepted accounting principles.

Several expenses have to be made now-a-days by businessmen as a matter of business prudence and expediency and such expenses should in no wise be disallowed as being merely personal expenses, 'not wholly and exclusively' spent for the purpose of business. The Income-tax Investigation Commission observed that the cost of personal requirements was sometimes deliberately shown as business expenditure. The Chamber would like to emphasise that many such expenses now-a-days have to be incurred by the businessmen which are really not personal expenditure but have to be incurred wholly on business considerations and to further the interests of business. The status and position of a man in business, profession or vocation should be accorded due consideration in allowing business or professional expenses.

The Chamber would specifically mention only a few items which should be allowed as admissible expenses and it would request the Commission to prepare a more comprehensive list of allowable expenses in order to avoid the possibility of assessing tax on inflated notional incomes rather than real incomes.

(i) Under the Sea Customs Act when certain items are imported and the law declares such imports to be unauthorised, the goods are confiscated but the importer is given an option to buy the goods at an enhanced price in lieu of confiscation. Such prices, which the Importers are called upon to pay in obtaining goods are considered to be 'penalty' prices and are therefore not admitted as an expense. It must be conceded that without such payments the goods from which the income arises could not have been secured. If goods are not taken by the original Importer and these are auctioned by the Customs and are purchased by a third party then the whole price is allowed to such a buyer. It should be considered that as illegitimate receipts also come within the purview of income for tax purposes, such prices even if these are penalty prices, should be considered as cost. Such 'penalty' prices can in no wise be mixed up with other types of penalties.

(ii) Secondly, the expenditure incurred in respect of taxation appeals is not allowed even though the appeals are won. Such expenditure on successful Income-tax Appeals should be allowed on consideration of justice and equity.

(iii) The legal and preliminary expenses for formation of a Company should allow on the same method as these are charged to profit in accounting. Similarly, capital losses should also be allowed to be adjusted.

(iv) Water Rates, Road Cess, etc., should be allowed.

Question 66.—Rates Structure.

(a) & (b): Consolidation of Income-tax & Super-tax.

In the opinion of the Chamber, income-tax and super-tax should be combined into a consolidated levy. Such consolidation would simplify the rates structure and would be more understandable by the ordinary taxpayer. The super-tax, after all, is only an additional levy on income and therefore there seems to be hardly any justification for taxing the income in two or three different names. The consolidation of the two rates of income-tax may also make it easier for an assessee, specially the smaller ones, to comply with the tax requirements with a lesser pressure on time, energy and expense. For the Administration also, it would be simpler in completing the assessments. The complexi-

ties of separate treatment of allowances, etc., in respect of income-tax and super-tax may also be made simpler by such consolidation.

The more crucial point for the assessee in India today is however, the issue of lowering the total burden of the tax on income, so that the levy may be more socially expedient at the present stage of the country's development requiring maximum incentive for saving and investment.

(c) Degree of Progression in Income-tax and Super-tax.

The degree of progression appears to be unsatisfactory for ensuring speedy development of the economy. The application of the maximum rate of 48 pies per rupee plus 5 per cent. surcharge on earned incomes above Rs. 15,000 and levy of maximum rate of Super-tax of as 8 pies 6 in the rupee on all incomes above Rs. 1½ lakhs have made the burden of the tax inequitable for the upper and middle groups of income earners and disincentive for capital formation.

In the next place, the progression introduced at the different slabs of income, also appears to be unsatisfactory. This will be clear from the following rates of basic income-tax:—

Rates of Income-tax per Rupee.

	1939-40	1947-48	1953-54	
	Rs. 1—1,500	Nil	Nil	Nil
Next	Rs. 3,500	9 pies	12 pies	9 pies } + 1/20th surcharge
Next	Rs. 5,000	15 p.	24 p.	15 p. } + 1/20th surcharge
Next	Rs. 5,000	24 p.	42 p.	36 p. } + 1/20th surcharge
Balance of Income	.	30 p.	60 p.	48 p. } + 1/20th surcharge

It would be found that while in 1939-40, the increase from the third slab to the fourth one was 9 pies in the rupee, in 1953-54, it is more than 21p. per rupee. The increase from the 4th slab to the "balance slab" in 1939-40 was 6p. as compared roughly to 13p. in the rupee in 1953-54. The rate is graduated only upto an income of Rs. 15,000; on the excess of income over Rs.15,000 the rate is really proportional.

In super-tax also, the rates in 1939-40 were as under:—

Rates of Super-Tax in 1939-40.

First Rs. 25,000	—	Nil.
Next Rs. 10,000	—	1a. in the Rupee
Next Rs. 20,000	—	2a. in the Rupee
Next Rs. 70,000	—	3a. in the Rupee
Next Rs. 75,000	—	4a. in the Rupee
Next Rs. 1 lakh 50 thousand	—	5a. in the Rupee
Next Rs. 1 lakh 50 thousand	—	6a. in the Rupee
Balance	.	7a. in the Rupee

In 1939-54, the rates are:

On the First Rs. 25,000	—	Nil	
On the next Rs. 15,000	—	3a. in the Rupee	+ 1/20th surcharge
„ Rs. 15,000	—	4a	„
„ Rs. 15,000	—	6a	„
„ Rs. 15,000	—	7a	„
„ Rs. 15,000	—	7½a	„
„ Rs. 50,000	—	8a	„
On the balance of total income.	—	8½a	„

It would be found that not only the rates are much increased at each slab, the progression too stands accelerated.

Incidentally, it may be also noted that the exemption limit for super-tax has remained same at

Rs. 25,000 and the first slice of exempted income also stands at Rs. 1,500 as these were in 1939-40.

The Company rates of income-tax and super-tax are also very high requiring adjustment in order to encourage investment in Corporate types of business enterprise. The Company rate was 0-2-6 in the rupee in 1939-40 and in the Finance Act of 1953, the rate is as. 4 in the rupee plus 5 per cent surcharge. Though this tax is refundable in the hands of the shareholders, the provision proves ineffective in practice for a substantially large number of share-holders, especially to small investors. The deduction in the hand of the Company also affects the investments incentive in so far as the ordinary shareholders look to the net dividend after deduction of tax as the return they are getting. The mobilisation of small savings thus gets impeded. An Investor in Company shares is thus virtually to bear the income-tax burden of 48 pies per rupee on every rupee of the dividend that he may receive, in addition to the burden of the non-refundable super-tax on Companies (Corporation tax), though such an investor may not be liable to pay any super-tax on his other incomes.

The rate of super-tax on Companies was only anna 1 in the rupee in 1939 and in the Finance Act of 1953, the tax comes out to be 11 per cent. on Companies with incomes below Rs. 25,000 and 17-2 per cent. on Companies having incomes above Rs. 25,000 and fulfilling certain conditions laid down in the Act. For certain other public Companies, whose shares were not offered for sale in a recognised Stock Exchange during the accounting year and which do not fulfil the prescribed conditions and some private limited Companies, have to bear a high rate of -/4/9 in the rupee which works out to 29-2 per cent as non-refundable super-tax on such Companies.

The views of the Chamber regarding super-tax on Companies would be found under Q. Nos. 79-81 below:—

(d) *Alternative Rates Structure.*

In adjusting the rates structure, the Chamber would urge for securing the following points:

(i) Income-tax and super-tax should be consolidated both for the individuals and for the Companies.

(ii) The consolidated rates should be graduated over a longer range so as to reach a maximum rate of as. 9 in the rupee at the level of an income above Rs. 3 lakhs for individuals.

(iii) The consolidated Company rate of income-tax may be 0/4/6 in the rupee and there should be no super-tax in addition to this.

(iv) The first slice of exempted income is to be Rs. 2,000 and the spread at each slab upto the slab of Rs. 50,000 should be Rs. 5,000, the second slab being for Rs. 3,000. After the level of Rs. 50,000, the spread at each slab may be Rs. 25,000 upto an income of Rs. 3 lakhs.

(v) In the consolidated rate of income-tax on individuals, the rate should not be higher at any slab than at present.

(vi) The Chamber would also mention that if the consolidated rates are expressed in terms of percentages, then the rates structure may be more easily understandable to the average tax-payer, making the tax compliance simpler and less expensive.

In case the suggested consolidation of rates are not considered acceptable, the Chamber would urge for the following alternative rates and exemptions:—

(a) The Company rate of income-tax which should be refundable in the hands of the share-holders, should be as. 3 in the rupee and a Corporation tax of 0/1/6 in the rupee, may be levied.

(b) A Company income of Rs. 50,000 should be exempt from Corporation-tax, and the exemption limit for super-tax on individuals should be increased to Rs. 50,000.

(e) *Surcharge under Article 271 of the Constitution.*

The Chamber is opposed to levy of surcharge except in emergencies like war. Even if surcharge is levied there can be no question of graduation again in the surcharge itself, because the income-tax and super-tax on which it is levied are on a graduated basis.

In a peacetime economy, the Chamber would strongly urge for the abolition of surcharge on income-tax. Whatever is realised by levy on income should be on the basis of one consolidated rate.

Question 67.—Exemption Limit for Income-tax.

The present income-tax exemption limit of Rs. 4,200 for individuals and Rs. 8,400 for Hindu Undivided Family seems to be low in view of the present cost of living. The exemption limit was Rs. 2,000 for individual in 1939-40 when the middle-class cost of living was not more than one-fourth of the present cost of living. The

Chamber is not clear whether full adjustment would be feasible in consideration of the revenue needs. It would therefore suggest that the limit may be increased to Rs. 6,000 with adequate adjustments for Hindu Undivided Family on the basis of this amount for each co-parcener in the family.

The exact limit of such exemptions would, however, largely depend upon the extent of individual and family allowances that may be granted in respect of the family members and dependents as suggested before.

Question 68.—Earned Income and Old Age Relief.

(a) Earned income relief is a feature of many modern tax systems. Its economic justification seems to be that the exemption provides against impairment of personal wealth which produce the income. The earned income relief may be looked upon as allowance for "human depreciation", as was observed by Sir Jeremy Raisman while first bringing this new feature into the Indian income-tax in 1945. Earned income relief provides incentive for work and conforms to modern social concepts of work and income. The Chamber is therefore in favour of maintaining the earned income relief.

(b) The definition of "earned income" as given in Section 2(6)(AA) excludes interest from securities, dividends and rents. In the opinion of the Chamber, dividend, interest and rents should not necessarily be considered as wholly unearned. It is true that when securities, shares or rent-earning properties are inherited, the inheritance may not involve personal exertion but when incomes are earned subsequently on these heads by an individual there is certainly exertion involved on the part of the Income earner and the degree of exertion may be sometime more than even exertions to carry on a trade or a profession or employment. So, a certain percentage of incomes under these heads should also be considered as incomes earned by personal exertion and therefore should be entitled to earned income relief. Moreover with the introduction of Estate Duty the unearned element involved in the inheritance of such tools of income would get taxed.

(c) The limit of earned income relief is partly linked up with the provisions for other personal allowances and, also with the exemption limit for taxation. The present earned income allowance is 20 per cent. of the earned income upto a maximum of Rs. 4,000. This upper limit was fixed up in 1946 when the cost of living was much lower and the exemption limit was also much lower. In the United Kingdom the proportion of relief is for 2/9th of the income, but the upper limit is £450, which is more than 3 times the exempted income. It appears that this ratio between exemption limit and earned income allowance may be introduced also in India. This would provide further incentive for work and personal exertion.

The Chamber would also like to mention that in the U.K., Income-tax Act of 1952, "old age relief" to persons above 65 years of age, is allowed at the same scale as earned income relief but the two reliefs are to be in substitution and not concurrent. Under Indian conditions the widows should also get similar reliefs. Such a relief would be a contribution towards old age security if introduced in India (Vide Section 211 of the U.K. Income-tax Act 1952).

It may also be mentioned that under the English Act, the earned income relief is not allowed to non-residents, but in India no distinction is made between residents and non-residents in respect of earned income relief.

Question 69.—Stock Valuation for assessment purpose.

The Chamber would like to emphasise at the outset that so far as the Government's revenue is concerned, too much need not be made of the issue of stock valuation. The valuation of stock should be fundamentally considered as a matter for the assessee to decide according to his business foresight and prudence. It should be also conceded that no standard method would be suitable for all types of businesses. The Company law has also never attempted to make any rigid provision in this regard. Assuming for argument's sake that an assessee increases or decreases the profit of the business of any particular year by over-valuation or under-valuation of the stocks, the profits gets adjusted in subsequent years and thus the Company's tax also gets averaged. The Chamber would therefore prefer a categorical statement in the Act itself that the valuation shown in the final accounts of the assessee should be generally accepted.

In the opinion of the Chamber, the stocks-in-trade should continue to be valued according to accepted principles which is "cost price or market price whichever is lower" and an assessee should be free to adopt the lower of the two prices every year.

The main difficulty that is experienced is about computation of the cost price of the stocks, and two methods are followed namely, "last in first out" and "first in first out". These two methods have been used

in different cases and differences of opinion arise as to the applicability of either of these methods in a particular case. The Chamber would suggest that in order to avoid difficulties and disputes as to the computation of cost price the *average purchase price* may be taken as the cost price of the closing stocks, unless the circumstances of a particular case warrant otherwise.

As to the valuation of the market price, of the closing stocks the Chamber does not agree with the recommendations of the Income-tax Investigation Commission that the Auditors should not accept the certificates of the management of a business undertaking but should compulsorily certify to the correctness of the value of stocks themselves. In the opinion of the Chamber it would neither be expedient nor practicable for the Auditors to undertake the valuation of the stocks themselves, and to certify the correctness of such stocks values. Apart from the question of competence of the Auditors to undertake the work, most companies close accounts almost at the same time and it would be hardly possible for Auditors to check stocks in all cases at the time of the closing. In the market valuation of the stocks the Auditors have perforce to depend on the market information to be supplied by the management.

The problem of valuation of stock in trade, is very vital in calculation of profits in business and the Income-tax Investigation Commission examined the issues involved, to some extent. They discussed certain methods of notional valuation in certain cases on the basis of book values and sales and estimated margins of profit. The Chamber is opposed to any such notional valuation. It may also be mentioned here that the Company Law Enquiry Committee also have not made any rigid recommendation for the valuation of stocks for the purpose of exhibition in the balance sheet.

The Chamber is also opposed to the Income Tax Investigation Commission's suggestion that the Income Tax Officers should be empowered to check stock lists at the time of preparation and to enter premises to satisfy themselves about their accuracy. In the opinion of the Chamber, this will be impractical task for them and such a power with the ITO's would be of little practical value. The verification of the stocks of a sizable business concern would extend for several days and weeks and it cannot be possible for an ITO to undergo the process of physical verification.

Question 70.—Assessment of Hindu Undivided Family.

In the opinion of the Chamber, the assessment of Hindu Joint Family should be such whereby the total burden of the tax on family may not be more than the sum total of the burden which may devolve on the individual earning members of the family if assessed separately. The tax should be neutral in this respect. For this, it appears that the maximum non-taxable limit should be proportionate to the number of adult male members comprising the family. The exemptions and allowances for whole family should be at least equal to the aggregate of the exemptions and allowances available to the Co-parceners if they are assessed separately.

Adequate adjustments should therefore be made for Hindu Undivided Families in respect of earned income relief, allowances paid to one or more members of the family who may manage the affairs of the family, and the insurance premia.

Question 71.—Exemption for Voluntary surrender of Managing Agency Commission.

It is felt that when the Managing Agents have to surrender or refund the whole or a part of their Commission, the amounts so waived or refunded should be exempted. Under the Managing Agency Agreement, the Agents take commission on net profits and they may draw it either on a monthly basis or on an annual basis. Now, in some years the Agents may have to surrender or refund the whole or part of their commissions in order to save the Company and/or to meet the demands of share holders. It has been noticed by the Chamber that if such refunds are surrendered or made in terms of an express agreement to this effect, then exemptions are allowed but, if there is no such express terms in the Agreement, these are not allowed in assessing the Managing Agents, the waiver or refund being considered as *ex gratia* payments. In the opinion of the Chamber, this seems to be unfair. The Managing Agents have sometimes to forego or refund the commission but an express term to this effect incorporated in advance may put the Agents under undue pressure from the shareholders and may give rise to various complications.

The Chamber does not exactly follow the apprehension expressed in the question about misuse of such a provision for exemption of waived or refunded commission. Firstly, the waiver or refund must appear in the accounts of the managed Company also, in addition to the records of the Managing Agent. Secondly, if such waived or refunded commission is exempted from the income of the managing agent it gets included in the managed Company's income, and therefore such amounts

of commission would not go out of the purview of income-tax.

Question 72.—Agreement for Double Taxation Reliefs.

The investments of Indian capital in foreign countries is likely to continue to be small as compared to investment of foreign capital in India. Therefore, the question of giving unilateral reliefs to avoid double taxation is of greater significance to India than of securing such reliefs by agreements because by such agreements, the total quantum of relief that may have to be given to the non-residents in India would be larger than the total relief that may be available to the Indian residents earning in foreign countries.

In making any agreement, it should be ensured that the Government may get the full benefit of the tax in respect of all incomes that arise in India. Secondly, it should be taken into consideration that the reliefs given to non-residents earning in India may be just reciprocal to the reliefs that the residents in India may obtain in the respective countries of the non-residents.

Question 73.—Valuation of Property and Allowances.

In determining the *bona fide* annual value of the property, only half of the tax levied by any local Authority subject to a maximum of one-eighth of the annual value, is at present deducted from the total rental. The Municipal rates have gone very high in many States and in the opinion of the Chamber, such rates should be deducted in full in determining the *bona fide* annual value of the property. The Committee understand that this deduction of Municipal rates from rental was agreed to by the Supreme Court of India in 1950 in their Judgement in the case of Messrs. New Piecegoods Bazar Company Ltd., Bombay, *versus* the Commissioner of Income-Tax, Bombay. But the decision was nullified first by an Ordinance and then by an amendment of the Act in 1950.

Secondly, the Chamber considers that where there are agreements in respect of rent, for a minimum period of say, 7 or 8 years, the annual value should be fixed on the basis of rents provided in such agreements, and in such cases the question of reasonableness which has naturally to be decided by the Income-tax Officers regarding the rent, need not be brought in.

Incidentally, the Chamber would also mention that there should be quinquennial valuation and adjustments in respect of allowances and deductions in order to secure some degree of averaging of incomes and allowances as provided in the Income-tax Act of the United Kingdom.

In respect of deductions, the Chamber would suggest that the allowance for repairs which is one-sixth of the annual value is proving too low under the present circumstances of high costs of material and labour. This upper limit is considered inequitable because of the fact that the cost of repairs have gone up by more than 200 per cent. while the rents have not increased by more than 30 or 40 per cent. except in exceptional cases. This allowance should be increased substantially.

The allowance for collection cost is at present 6 per cent. at the maximum and no house-owner finds it possible to meet the collection costs within this 6 per cent. limit. The Chamber would suggest that this allowance should be increased statutorily to 15 per cent.

Lastly, at present no depreciation allowance is granted on house properties if these are not used for business purposes. The Committee would suggest that depreciation allowance should be granted on all buildings if the income arising out of it is to be taxed in conformity to the principle of guarding against impairment of capital. This would be of particular importance under the prevailing conditions when there is dearth of living accommodation, especially in the urban areas and when the building activities are to be encouraged.

The annual value of the house property constructed between 1st April 1950 and 31st March 1954 is at present exempt from income-tax for 2 years from the date of completion of the construction. In the opinion of the Chamber, this concession may be continued for some years more in order to encourage building activities.

Question 74.—Set-off of Loss.

Adequate provision for set-off of business loss can offer substantial inducement to risk investments. Such set-off provisor in the law injects an element of averaging income and thus brings an amount of equity in taxation. The present provisions in the Indian law are, however, not considered adequate or equitable.

Firstly, the facility for set-off is limited to a period of 6 years only. In the opinion of the Chamber, when a business actually incurs loss, such loss should in all fairness, be first allowed to be set-off in subsequent years before taxing income of such subsequent years. The existing limitation of 6 years means that if a Company incurs loss for 5 or 6 years and then earns profit, it is taxed even before complete set-off of its previous losses. This may even lead to taxation of capital and this limitation period thus works against

those undertakings which may become profitable only after 5 or 6 years. The Chamber would therefore suggest that this limitation period should be abolished.

The Chamber welcomes the recent amendment in Section 24 of the Act which has removed the difficulties that were created by the Supreme Court judgement in the case of *Anglo-French Textiles Company Limited versus the Commissioner of Income-tax, Madras*. The recent amendments have also made it obligatory on the Income-tax Officers to determine the loss for the purpose of carry-forward. But the amendment made by the Finance Act of 1953 prescribing that speculative losses can be set-off against only speculative profits, appears to be onerous to the business community, and in spite of the clarifications made, it seems that complications still continue and may particularly affect the stock exchange and hedging transactions. This provision should therefore be modified suitably.

In the third place, set-off is allowed only in respect of income of the same business. An assessee's financial position is to be guarded, so set-off should be allowed against all other incomes of the assessee, no distinction being made between business income and non-business income.

Lastly, the Chamber would like to stress that set-off of loss should be granted even before making adjustments for making depreciation, if there is any limitation period for such set-off. It should be conceded that depreciation is a device for creating a fund for replacement of the assets at the expiry of its life, whereas loss made is a loss of liquid cash. The loss incurred thus, is an impairment of the liquid position of the assessee which requires to be replenished against subsequent profits before any question of making provision for future replacement of assets can be considered. The limitation period sometimes does not enable the assessee to get the benefit of set-off.

Carry-back of Loss

The question refers to carry-back of loss only in case of cessation of business. The Chamber would like to emphasise that this carry-back allowance should be granted in other cases also particularly to the newer industries which were started during the post-war and post-Independence boom period. Such carry-back allowance was in vogue for long in the United States, and even in the Revenue Act of 1950, there was one year carry-back allowance for net operating loss. If even in the developed condition of the American economy, carry-back of loss could be permitted then it stands to reason that some provision for carry-back of loss for a period of 3 or 4 years may greatly help the Indian industries, particularly in the present phase of development. The present phase is a phase of recession and such carry-back allowance may very greatly warm up the flagging enthusiasm for new business. Usually, the carry-back allowance is considered to be of little value to new business. In case of India, however, it has a special significance. The Indian Independence just followed the cessation of the War, and with the spur of freedom many industries were started, and the war-time industries also continued to make good profit. This phase of good profit continued almost up to 1950 and then from the latter half of 1951, the phase of declining profits or no-profit started. The new industries have naturally paid tax even during their initial stages (after adjustments for 6 per cent. dividend). Such profits were earned under abnormal conditions and with the passing of that abnormal phase, the new industries have been put to great difficulty. Such allowance for carry-back of loss to these new industries at least for sometime may be very helpful.

As to the question of carry-back allowance in the case of cessation of business, the Chamber would recommend such a provision being introduced for a period of 5 or 6 years.

Question 75.—Payment of Advance Tax : Section 18A.

The justification for advance payment of tax on the principle of "pay as you earn" was much greater during the emergency of the War period, and in the peace time economy, and particularly in the present phase of declining profits, the provision is proving onerous for the assessee. Under the prevailing financial conditions, the Chamber would prefer repeal of this Section. In its opinion, this advance payment system has been affecting the speedy assessment, because the Income-tax Officers do not show much interest in assessment because of advance collections.

In this connection the Chamber would also suggest that Section 23B for provisional assessment should also be deleted from the Act. The existence of this Section seems to be also impeding speedy assessment. The administration has also been complicated by these advance payment and provisional assessment systems. The Chamber would strongly urge that the tax should be collected only on the basis of prompt assessments made on the completion of the final accounting of the assessee and the present method of payment of taxes at

three stages, viz., advance payment, provisional assessment and final assessment, is unduly complex and increases the cost of compliance.

Question 76.—Assessment under Section 34.

The present widened Section provides for assessment in four different cases, (1) Income which has totally escaped assessment by an act of omission or commission by the assessee, (2) income which has been under-assessed, i.e., where portion of the income has been left out in making assessments, (3) where the income has been assessed but at an "unduly" low rate, and (4) where the assessment has allowed relief which is considered "undue" or too liberal. While the Chamber appreciates that there must be some provision for roping in escaped income, it considers the Section to be too wide, keeping the assessee under the sword of Democles for 8 long years and 4 years even where the assessment was made but the Authority detected later on that too much relief was given or too little tax was charged. The Chamber would also like to observe that the volume of escaped assessment must have gone down now and the need for such wide powers applicable for 8 years need not be continued. Such a provision necessarily injects an element of instability and a scope of harassment in income-tax assessments.

In the next place, the Chamber would suggest that circumstances of excessive relief or application of too low a rate, if desired to be re-opened, should be re-opened within a period of one year and such privileges of re-opening for the assessing Authority should not be unduly long in comparison with the time that is given to the assessee for making appeals.

It is also to be considered that if the taxing Authorities are allowed to rectify the assessments, the assessee should also have some scope for rectification of the mistakes that may be committed by them in the returns or which they may find to have been committed by the Income-tax Officers in making the assessments.

At present the Taxing Authorities can reopen a case only if the Income-tax Officers has reason to believe that an assessee has escaped the assessment or has been under-assessed at too low a rate or has been granted excessive relief. This makes the position of the assessee very fluid. The Chamber would suggest that in cases of re-opening, the ITO's must give specific reasons for re-opening the case and these reasons must be intimated to the assessee.

Lastly, the heading of the Section, viz., "Escaped Assessments" should be changed, because the cases of under-assessment which are not due to any fault of the assessee, should be treated differently from the cases of escaped assessments.

Question 77.—Simplification of Procedure.

Complicated and delayed assessments affect the tax-payers' morale and keeps the assessee away. The Chamber would suggest that in case of Companies the certificates of the Chartered Accountants should be automatically accepted for assessment. The time lag between the provisional and final assessment should also be shortened and all delays in assessments should be avoided. It has been represented to the Chamber that usually the assessments are held up for 2/3 years and are somehow completed at the end of the limitation period. This creates a very bad impression on the assessee.

In case Section 18A is not repealed, and the assessee makes advance payment, there should be final assessment and not again a provisional assessment after advance payment of tax.

The Chamber also understands that in practice, Section 23B is applied only in those cases where the Income-tax Officers can demand more of tax over and above the advance payments that have been made in terms of Section 18A. In case where the assessee may obtain refunds the provisional assessments are usually not made.

Question 78.—Assessment Procedure and Appellate Tribunal.

The Chamber is strongly opposed to the suggestion that the Appellate Tribunal should have the power to enhance assessment in the same manner as the Appellate Assistant Commissioners. The Appellate Tribunal should be judicial authority and not an assessing authority. At most the Tribunal may order reassessment whether for reduction or for enhancement as they may deem fit. In spite of all improvements there is a feeling that 100 per cent. judicial attitude cannot be obtained from the Appellate Assistant Commissioners, ostensibly due to their affiliation to the Assessing Department. So, the association of the Appellate Tribunal with the work of assessment would be still more undesirable.

In the opinion of the Chamber, the Appellate Tribunal should rather be completely taken out of the jurisdiction of the Finance Ministry and should be put under the Ministry of Law.

Question 79-81.—Corporation Tax.

Basic Approach.

The questions are framed on the assumption of continuance of Corporation Tax. The Chamber would like to emphasise that the issues raised in the Questions should be examined on the back-ground of the weakness in the basic justification of the Corporation tax in the present stage of the country's development, particularly the paucity of the Company type of business in India. It must be conceded that taxation of Corporate bodies as such was introduced in the tax systems of other countries only after considerable progress in the formation of Corporations in those countries and when industrialisation attained a sizeable standard. There is no denying the fact that the Corporate income-tax has repressive effect on risk-taking, investment and economic expansion, and it also affects managerial decisions. The Corporate type of business organisation has not adequately progressed as yet and the double taxation element in the Corporation tax affects incentive for risk investments in Company shares. If a Company is taxed at say, 25 per cent. on its net income as Corporation tax, it must earn a little over Rs. 133 in order to have Rs. 100 for dividend. This means, that a Company must be able to have a 33 per cent. higher productivity with its share capital than an individual enterprise in order to achieve parity between the two. The Corporate income-tax works against share capital financing as compared to loan capital financing. It needs to be appreciated that a shareholder whose personal income may be assessable at a much lower rate or may not be assessable at all, thus gets inequitably taxed if he invests in share. Such a position seriously affects the propensity of the individual to invest in shares and at the present stage of capital formation and organisation of Joint Stock Companies, the Corporate income-tax should therefore be considered as unsuitable for India.

On considerations of Central revenue and facility of collection, if the tax is to be continued, however, then it needs to be kept very low, and the scheme of Corporation tax needs be planned so as to reduce its repressive effects to the minimum, particularly on the smaller and new companies which are also otherwise at a disadvantage to attract investment in their undertakings. The Chamber has, therefore, indicated in reply to Question 66(d) above that, if at all to be continued, the rate should not be higher than 0-1-6 pies in the rupee with exemption to all Indian Companies upto an income of Rs. 50,000 and in that case the Company rate of income-tax should not be more than as. 3 in the rupee.

Subject to these general observations, the Chamber would like to give their replies to the specific questions made in respect of Corporation Tax.

Question 79.—Progression in Corporation Tax.

The Committee are basically opposed to Corporation tax at the present stage of development of the corporate type of business in India. The Corporation tax is virtually an additional tax and there is much reason for its consolidation with the income-tax for taxation and necessary adjustments at the hands of the shareholders. Even if it is continued, the rate of the Corporation tax should be kept at a very low level not exceeding 0-1-6 pies in the rupee.

Secondly, all Indian companies, public or private, whose incomes do not exceed Rs. 50,000 should be exempted from the Corporation tax, even if the incomes of all Companies upto Rs. 50,000 are not exempted.

Barring this exemption, which would help the formation of new and smaller companies, the Chamber would not recommend any progression in the rate of Corporation tax.

The Chamber would also emphasise that progression in Corporation tax may unduly affect the middle-class shareholders of the companies.

The Chamber would reiterate that the argument of privilege of the joint stock companies justifying the imposition of Corporation tax does not appear to be expedient at this stage of development. Moreover, in countries like Canada where Corporation tax was introduced even before the Great War I, the tax was introduced purely out of revenue consideration. It was introduced in the U.K. during World War I, and was abolished during the post-war period. In Canada, Dr. Vineberg in writing on Provincial Taxation of Corporation Profits in 1912, observed that "the primary purpose, generally speaking, is to raise revenue, and all principles of equity are relegated to the background to make room for base of taxation which may even approximate justice."

In India, at present, there is an element of graduation in respect of super-tax on Company income (i.e., Corporation tax), in so far as the rebates are allowed to Companies declaring dividends within India and earning an income not exceeding Rs. 25,000, and to higher incomes also on fulfilment of certain other conditions. But these graduations are not applicable to

the private limited companies. This latter limitation has virtually made the graduation ineffective in so far as the promotion of the corporate type of business is concerned. It is to be conceded that in the initial stages of a business undertaking the promoters generally think of starting the company as a private limited one and after some progress is made it is converted into public limited companies.

As already mentioned, the Chamber would recommend differentiation only upto an income of Rs. 50,000 and no other differentiation among the Indian Companies.

Question 80.—Different Rates of Corporation Tax on Different Types of Corporate Enterprises.

On principle, the Chamber is opposed to the imposition of different rates of Corporation Tax on different types of Corporate Enterprises, provided the rate is kept very low as suggested before and an income of Rs. 50,000 is exempted from Corporation Tax.

Question 81.—Exemption of Inter-Corporate Dividends from Corporation Tax.

The Chamber would strongly urge for exemption of inter-Corporate dividends from Corporation tax. The tax treatment of dividends received by one Company from other companies should be considered fundamentally different from the question of taxation of dividends received by an individual from a company. Upto 1935, such inter-Corporate dividends were totally exempt from Corporation tax in the U.S.A. In Canada also such inter-Corporate dividends were exempt from Corporation tax in many of the Provinces levying Corporation tax. Even now in the U.S.A., when one Company receives dividend from another Company, the receiving Company is allowed a deduction of 85 per cent. of the dividends received.

The object of taxing inter-Corporate dividends is ostensibly to discourage the growth of giant Holding Companies of complex structure and it is also considered by some as an anti-monopoly instrument. At the present stage, the Chamber finds hardly any scope for development of such large holding companies in India. It therefore feels that inter-Corporate dividends of the Indian companies should be exempted from the burden of double taxation. To guard against the growth of an undesirable structure of holding companies, Company law appears to be a more appropriate instrument and that law is also now before the Parliament for thorough modification and overhaul.

Through the Finance Act for 1953-54, a provision has been added in the Income-tax Act (Section 56A) exempting the dividend received by a company from certain categories of industrial undertakings from super-tax. The Chamber welcomes the adjustment made by this provision but it feels that the principle should be extended to include dividends from any company without restriction on its registration after 31st March 1952. In the present form, this concession is not likely to be effective inasmuch as most of such new companies can hardly be expected to give any dividend in the present phase of business conditions in the country.

Question 82.—Taxation of Banks, Investment Companies and Insurance Companies.

(a) *Banks*.—The Chamber has already indicated some special facility that should be extended to the Indian Banks in respect of profits of their foreign branches, in reply to Question No. 59 above. The Chamber appreciates that there are certain special characteristics of Banks which differentiate them from other businesses and which requires special consideration for the purpose of taxation of Banking incomes.

Firstly, the Banks are regulated by special law and have to conform to the provisions of that law in respect of capital, reserve, etc. The Money and Credit policies of the Reserve Bank of India also directly impinge on the banking transactions and profits. Secondly, the Banks have to carry a stock of intangible properties and have to increasingly hold portfolio of Government securities. All these may warrant special treatment of banks in respect of dividend declarations, allowance for reserves, computation of incomes from properties, credit for shares held on blank transfers, dividends received from Companies, etc. In Canada, where Corporation tax has been in vogue, Banks have been all through separately treated under the Provincial laws and Corporation tax has been based on either paid-up capital or number of branches instead of on profits. The Commission may examine on more expert level about these points.

The Chamber would suggest specific provisions in respect of the following:—

(i) Amounts transferred to statutory reserve fund as required by the Banking Companies Act should be allowed for income-tax. This provision is necessary in the interest of healthy development of banks. Alternatively, the Commission should recommend amendment of the Banking Companies Act to compute net

profit for statutory reserve after deduction of the Corporation tax and Income-tax.

(ii) At present bad debts actually written off, are allowed as deductions under Section 10. In the interest of healthy development of banking, the banks should be encouraged to provide reasonable amount every year as provision for doubtful debts irrespective of the fact of their being bad debts. It is well-known that in the period of booms the banks made good profits and the bad debts are very few. If the suggested reserve for doubtful debts is allowed to be built up the bad debts in lean years can be met out of such reserve, without affecting the profits of the company which is likely to be allowed during such lean years. In case such reserves are found to exceed the actual bad debts during the period of say, 5 years, the balance standing to the credit of such reserve fund may be subjected to tax at the periodic interval of 5 years. Incidentally, it may be mentioned that in Japan 3 per cent. is allowed as provision against bad or doubtful debts. For this allowance Auditor's Certificate as to the quantum of doubtful and bad debts may be required.

(iii) Interest on securities should be taxed under Section 10 and not under Section 8 in respect of banks. At present no expenditure is allowed under Section 8 in computing the income from securities, excepting commission on collecting interest. It is to be conceded that the securities represent the stock-in-trade of the bank, and as such both income from securities and profit or loss in dealing with the securities should be taxed under Section 10 only. In this respect no distinction should be made whether the interest is received from tax-free securities or otherwise.

(b) *Investment Companies.*—The Chamber feels that organisation of *bond fide* investment companies may facilitate the investment in industrial shares by mobilising the savings of the smaller individual investors. In a way the investment companies may be expected to strengthen the base of industrial finance in the country, in the private sector. Special treatment of such investment companies is, therefore, warranted.

Firstly, the properties they hold are the stocks and shares which may appreciate in value and, therefore, in computing the income in any year such capital appreciations in the year of sale cannot be taken to be wholly the income of a particular year. The principle of averaging incomes for this purpose seems to be specially relevant in respect of the investment companies.

Secondly, these companies should be exempted from payment of super-tax in respect of dividend incomes which have already been taxed in the hands of the paying companies, even if the super-tax on companies is kept separate under the name of Corporation tax.

Thirdly, the incomes of investment companies are likely to be much more fluctuating and irregular than other types of business for which also averaging or at least quinquennial adjustments would be justified.

In respect of taxation of undistributed profits there should be no discrimination against the investment companies as was recommended by the Income-tax Investigation Commission. Such companies also require to maintain reserves for two reasons, namely, (a) for the purpose of equalisation of dividends; (b) to make provision against fall in the prices of shares or investments that may be held by the investment companies.

At present the Central Board of Revenue may specially recognise trust companies for tax concessions, but the Chamber is not aware of such recognition having been given to any trust company. The Chamber would urge for incorporation in the Act itself of some provision for recognition of trust or investment companies for the purpose of taxation.

Regarding the taxation of investment companies special provisions on the lines of Sections 257 to 264 of the Income-tax Act of 1952 of the U. K. may be examined.

(c) *Taxation of Insurance Companies, specially Mutual Companies.*—The Committee consider that the load of taxation on Life Assurance Companies should be substantially lowered, these institutions being really institutions aiding social security and capital formation.

Secondly, at present, differential rates of income-tax and super-tax on Proprietary and Mutual companies exist. According to the Indian Insurance Act not less than 92½ per cent. of the profits must be allocated to Policy holders. It would thus be found that even the Proprietary Life Assurance Companies in India are at least 92½ per cent. Mutual. The Chamber, therefore, feels that the balance of 7½ per cent. of the profits at the maximum, available to the shareholders should not be discriminated against. This little concession to shareholders of Life Assurance Companies would secure greater good for the Society by encouraging Life Assurance Business.

As to the taxation of the Policy holders share of the surplus, the Income-tax Investigation Commission recommended that under a "profit basis" of assessment, the bonus load should be excluded from the taxable quantum. At present, however, 80 per cent. of the Policy holders' share of surplus is only exempted in place of 50 per cent. exemption before. The Committee strongly feel that the policy holders' share of the surplus should not at all fall under the category of income, profits or gains, and as such should not be liable to taxation under Income-tax Law. In fact, in the United Kingdom also, the entire surplus distributed to or reserved for or allocated to the Policy holders is excluded from taxation.

In the next place, the Chamber would strongly recommend that the entire management expense should be allowed as deduction for assessment of Insurance Companies. The Income-tax Investigation Commission recommended only 15 per cent. of the renewal premium instead of 12 per cent. on account of management expenses and this has been given effect to by the Income-tax Amendment Act of 1953. Under the Indian Insurance Act, there is statutory limitation on expenses and it would be inconsistent if the expenses allowed under the Income-tax Act are different from those allowed under Insurance Act. The Committee would like to observe that when continuous supervision for enforcing the statutory provisions and for guiding the Insurance Companies, has been provided in the Office of the Superintendent of Insurance, it should be presumed that the expenses of the Companies are being regularly checked up by the Government. There should not be, therefore, any objection to allow deduction of the actual expenses incurred by the Companies. The Chamber understands that this is also the practice in the United Kingdom. If the Government be hesitant about the effectiveness of supervision of the Superintendent of Insurance, and therefore do not feel inclined to follow the British practice, the Chamber must urge that at least deduction for expenses should be the same as that provided under the Insurance Act.

The Chamber does not agree with the view of the Income-tax Investigation Commission that the profits that are distributed amongst the shareholders should be treated as standing on the same footing as profits made by any other company with the liability to even corporation tax. As has already been observed, Indian Life Assurance Companies are at least 92½ per cent. mutual under the present law and to put the balance of some 7½ per cent. of the income at the maximum under Income-tax and Corporation tax, at the same levels with other Companies would be inequitable for the shareholders.

Regarding the inter-valuation period also, the present Income Tax Act differs from the Indian Insurance Act as amended in 1950 in the matter of computation of profits. It is to be conceded that when inter-valuation period of Insurance Companies stands shortened from the previous 5 years to the present 3 years, unless the Income-tax Act is similarly amended, only 3/5ths of the tax deducted at the source during the preceding inter-valuation period of 5 years, would be given credit during the subsequent 3 years, with the result that 2/5ths of the amount will be lost to the insurers and the Companies will have to bear the additional burden.

In consideration of the vital importance of Insurance Companies engaged in business of General Insurance, in the country's economy, and particularly in the matter of earning invisible income for the Nation, it appears that special treatment may be also warranted for the General Insurance Companies in respect of their "foreign" incomes.

It is sometimes argued that in the public interest insurance companies require regulation and that involves additional expenditure on the part of the Government. Regarding this, it may be said that the Insurance Business have also to bear various other levies in the form of annual filing fees, Agents licence fees and several other imposts.

Question 83.—Differentiation of Distributed and Undistributed Profits of Companies and Section 23A of the Income-tax Act.

The Chamber is opposed to any differentiation between distributed and undistributed profits of Companies for tax purposes. The Chamber is also opposed to any notional distribution of profits as provided in Section 23A of the Income Tax Act.

The Chamber appreciates the need for ploughing back of Company profits for expansion and investment, but it feels that to realise this object, the load on Company profits need be lowered rather than a little concessional taxation of undistributed profits after imposing high taxes.

The Chamber has already suggested that the Corporation tax and the personal income-tax on Company dividends should be consolidated, and if this suggestion is accepted, the whole question of differentiation would assume a different significance. Even if the Corpora-

tion tax is continued, the Chamber has suggested the lowering of the tax to 0-1-6 pies in the rupee, and if this suggestion is accepted, then the Chamber would not support any differentiation in favour of retained profits. In fact the existing rebate system in respect of retained profits of some Companies is of recent origin in the Indian Tax system.

The undistributed profits of Companies are ultimately the incomes of the shareholders, and if such profits are taxed at a lower rate, then there is a clear discrimination against the profits earned by the proprietorship and the partnership enterprises which are taxed at the full personal rates irrespective of whether such profits are retained in the business or are distributed. Secondly, for normal functioning of the private sector, the profits should be allowed to flow to the hands of the shareholders for re-investment, and the investment market should be allowed to decide what should be ploughed back in the particular enterprise and what should flow in other enterprises. In this regard the taxation policy should remain neutral. Differentiation in favour of retained profits may not result in the best allocation of the investment resources, because the investments would not be tested in the free market of investments.

The Chamber agrees that the retained profits may sometimes be helpful for a Company to more easily secure the business capital which it may be difficult and expensive to acquire in the capital market. But it would be bad in principle to provide positive inducement for such retention by preferred tax treatment. The Chamber is not in favour of a tax policy being used as an instrument for allocation of resources in the private sector.

As the Chamber is basically opposed to preferential taxation of retained profits, the question of evasion of tax by retention of profits or the utilisation of such retained profits for productive purposes, does not arise.

The rebate system on undistributed profits was introduced in the Indian tax system only recently, principally as an anti-inflationary measure along with limitation on dividends and also to partially minimise the repressive effect of the high load of tax on Company profits. The Chamber feels convinced that the phase of profit inflation is already over and it presumes that the present Commission would definitely lower the load of tax on Company profits. It therefore does not find any further justification for differentiation in favour of retained profits. In the interest of private sector of the economy as a whole, such differentiation should not be made.

Section 23A of the Income-tax Act :

As has already been observed, the Chamber is opposed to any notional distribution of profits as provided by Section 23A. It therefore recommends deletion of the Section.

As far as the experience of the business community go, the operation of the Section has affected the financial decisions of the Companies. The Section unduly discriminates against the private limited Companies and the Chamber does not hold the view that such Companies are formed principally with the motive of evading tax. On the contrary, the Chamber would reiterate that enterprises are first constituted in the form of private limited Companies and then after some success, these are converted into public limited Companies.

In this connection the Chamber may mention that neither the British law nor the US law, wherein preventive provisions exist against retained profits, makes any statutory provision as to the arithmetical ratio of dividends which is notionally taken to have been distributed as is done by Section 23A of the Income-tax Act in India. In the USA, Section 102 of the Internal Revenue Code envisages penalty rates of super-tax on Companies that accumulate profits to prevent the imposition of super-tax upon the shareholders, and the accumulation of profits beyond the *reasonable* needs of business is considered to be a *'prima facie'* evidence of a purpose to avoid super-tax. But the penalty rates are imposed only after very careful examination of the *entire financial position of the Company*. In the U. K. Income-tax Act of 1952, various indicators of the needs of Companies are mentioned for measuring the adequacy of accumulated profits in Section 246.

Even if some provision on the lines of Section 23A is continued, it should be suitably amended so as to generally guard against the deleterious effect of the notional distribution of profits. In particular, the following points should be secured:—

- (a) In making a notional distribution, the amount of profit should in no case be taken to exceed the net profit shown by the Profit and Loss Account of the Company.
- (b) In no case, a Company should be deemed to have distributed as dividend more than 60 per cent. of the profits, irrespective of whether its reserves exceed the paid-up capital or not. In other words the first proviso to sub-section (1) of Section 23A should be deleted.

Question 84.—Super-tax on Company Dividends.

The Chamber has already suggested that income-tax and super-tax should be consolidated both in the case of the individuals and of the Companies. If this suggestion is accepted, then there would be no question of super-tax on Company dividends.

If, however, a Corporation tax of -1/6 pies in the rupee is levied in addition to an income-tax of As. 3 in the rupee, as alternatively suggested in reply to Q. No. 66(d) above, and if the rates are not consolidated even in the case of the individuals, then the Chamber would strongly urge that there should not be any super-tax on Company dividends, in so far as the Corporation tax would be there on the Company profits. The super-tax on Company dividends with Corporation tax on Company profits, means double taxation of Company incomes, and this affects investments in Company shares. In the opinion of the Chamber, such dis-incentives should be avoided.

Question 85.—Taxation of Public Undertakings.

In reply given to Question No. 11 in Part I the Chamber has suggested taxation of Public Undertakings of industrial and commercial nature at par with similar Undertakings in the private sector. This would enable better comparison of the relative efficiency of the public and private sectors. Secondly, the Central Exchequer in that case would also get revenue out of State Undertakings and the State Governments would also obtain some indirect taxes from Central Undertakings within their respective States.

It is apprehended that if the Public Undertakings continue to be expanded and if these continue to remain tax-free, then it would bring about re-adjustment in the finances of the Centre and the States resulting in further attempts on the parts of Governments to raise revenue by taxing the private sector to finance the expenditure of the Central Government.

Question 86.—Using the Services of Chartered Accountants in Assessments.

So far as the companies are concerned the services of the Chartered Accountants are being very widely used even now. The partnership firms and the proprietary concerns are also gradually using the services of the Chartered Accountants more and more. The Chamber is, however, opposed to any legal obligation being imposed on the assessee in this regard. The already existing trend for wider use of the services may be accelerated if the computations of incomes made by the Chartered Accountants and the certificates issued by them are given wider credence than at present. In the case of companies the auditors have considerable legal obligations under the Companies Act and, therefore, the certificates issued by them can be outright accepted without any question. In respect of partnerships and individuals also their certificates should be given equal credence.

In this connection, the Chamber would like to invite the attention of the Commission to circular No. 47 (XXIV-I), dated the 18th December 1952, whereby the Central Board of Revenue instructed the assessing officers that the auditors' certificates should not be taken to be sacrosanct and "should not be given more credence than the certificates of the assessee's own accountants". The Chamber appreciates the circumstances in which the circular was issued, namely that a particular auditor was found to be negligent in issuing the certificate in the case of a non-company assessee. In the opinion of the Chamber delinquency in one or two individual cases should not prompt the taxing authorities to issue a general circular like the one under reference.

In case a Chartered Accountant issues a certificate as to the taxable income of a non-company assessee, he may be deemed to have done it on the basis of the same code of conduct according to which he issues certificate to a company regulated by the Indian Companies Act. But there should be no obligation on the part of the assessee for compulsory certification of accounts or income-tax returns. This will very much impinge on the small businessmen and the cost of tax compliance may all the more increase.

On the whole, the Chamber is in favour of allowing the present trend to continue in the matter of utilisation of the services of Chartered Accountants.

Question 87.—Representation of Assessee by Income-tax Practitioners.

In the opinion of the Chamber the present provisions of Section 61 of the Income-tax Act appears to be sufficient in respect of representation of the assessee before Income-tax Authorities. At present representation is possible through any person authorised by the assessee in writing or by a lawyer or accountant or

income-tax practitioner, as described under Section 61. As to the question of fees the Chamber feels that any statutory provisions in this regard would be unsuitable for all the different categories and types of assessee. Even if such a schedule of fees is laid down it can hardly be made effective.

As to the level of proficiency the Chamber is of opinion that the existing provisions of the Act are sufficient to ensure a minimum level of proficiency on the part of the representatives in respect of the Income-tax law, rules and regulations. Regarding the question of conduct, the Chamber, therefore, does not consider already rules of conduct for the lawyers and the accountants, and for others sub-section (3) of Section 61 appears to be sufficient for maintaining certain rules of conduct. The Chamber, therefore, does not consider it necessary to have any separate statutory provision for registration of income-tax practitioners laying down the rules of conduct and schedule of fees.

Question 88.—Publication of the names of persons who are penalised for concealment of income.

In the opinion of the Committee publication of the names of persons 'penalised' for concealment of income is bad in principle and would be ineffective in assisting to check evasion. Concealment of income may be of various degrees ranging from so-called technical concealment of a very small portion of income arising out of the complexities of law itself to the total concealment for the purpose of evasion. Any statutory power for publication of the names of assessee in all such cases of concealment can hardly be justified on principle. In cases where assessee are criminally penalised in Courts of Law the proceedings are automatically published in the Court proceedings which may be available to any member of the public.

Unless the matter goes to Court and it is proved in a Court of justice that there has been really a concealment of income amounting to cheating of public revenue, there can be hardly any ground for a tax collector to defame a person by publishing the name of an assessee with the ostensible purpose of lowering his status in public eye. Secondly, if publication of such names becomes a routine in all cases of concealment of income then it can hardly have any effect, because it will be taken to be a feature of the income-tax administration. The income-tax Investigation Commission examined these issues and dropped the idea of giving wide publicity of the names of persons who are found to make gross under-statements of their incomes.

The concealment of income may arise due to delinquency prompted by economic inability to pay or out of an attempt to avoid tax by taking advantage of the loopholes of the law or out of attempts for evasion of the tax. A high level of taxation and manner of administration also induce avoidance and evasion. In the opinion of the Chamber all such concealments cannot be classed in the same category and it would be difficult in practice to make distinctions among the assessee for taking a decision whether the name should be published or not. The question of cheating is largely a matter of motivation which cannot be easily determined.

Question 89.—Exclusion of Perquisites.

In the opinion of the Chamber the present exclusion of perquisites from taxable profits cannot result in much loss of revenue. Provision for such perquisites becomes necessary in business and naturally can be classed as almost normal expenses of modern business. From the point of view of individual employee, however, these perquisites do not at present bring such benefit the monetary value of which may be considered to constitute any sizeable proportion of the income. In the opinion of the Chamber, therefore, perquisites as are provided by the Commercial Houses to their employees should be excluded from taxation both in the hands of the Companies and in the hands of the employees.

In factories which are mostly located outside the urban areas, the staff which are required to remain within the factory areas or nearabout have to be provided with quarters and while the company has to spend money after it the employee cannot be deemed to have received the income, as such quarters can hardly be said to have any rental value.

Secondly, under present conditions considerable amounts of money have to be spent through the employees for entertainments, publicity, conveyance, etc., and the amounts involved in such perquisites given to the employees should not be taxed.

The business houses have now-a-days also to spend considerable money for providing amenities to the staff like giving free lunches, free conveyance, etc., in order to provide better conditions of work and improve efficiency. Such expenses are normal expenses of modern business and should not be taxed.

Question 90.—Realisation of Tax from Companies under Liquidation.

In cases of companies under liquidation, there may be an obligation imposed on the Liquidators to bring the fact of the liquidation order to the notice of the Income-tax Authorities and on receipt of such intimation, the Income-tax Officers may promptly assess the due tax and appropriate notice may be served upon the liquidators of the Company. Thereafter, the Income-tax Authorities should rank as creditors like other ordinary creditors except in respect of the last one year's assessment regarding which the taxing authorities may be accorded preferential position. The Chamber understands that in respect of individuals there is priority given in respect of tax on bankrupts assessed. The Chamber is definitely of the opinion that the taxing authorities should not be accorded any preferential treatment for the entire tax dues if such dues relate to the income for more than one year before the date of liquidation.

The Chamber would also like to emphasise that the payment of dividends to the shareholders or the payment to the creditors should not be delayed due to any delay in the assessment of such Companies under liquidation. It should be enjoined on the Income-tax Officers to complete assessments of Companies under liquidation within a stated period.

Question 91.—Conferring of Wider Powers on Income-tax Authorities.

The Chamber considers that the Income-tax Authorities have even now enough powers in their hands to check evasion and avoidance and there is no necessity of any extension in their powers. As was observed in the Preliminary Memorandum of the Chamber, (Para 6) the effectiveness with which a tax law is enforced is one of the principal determinants both in respect of yield and equity of taxation measures. The administration of a tax system must be a two-pronged operation, the operation of the tax administrative machinery of the Government on the one hand and the attitude of the tax payers in respect of tax compliance on the other. The Chamber considers that any large discretionary power in the hands of the Income-tax Authorities is fraught with danger of affecting the tax payers' morale. Tax Payer equity requires that tax administration should be executed as objectively as possible and the powers should be so given that there may be as little scope as possible for favouritism, arbitrariness or harassment.

The Income-tax Investigation Commission examined this question of extension of powers of the Income-tax Authorities and made certain recommendations to which the Chamber is definitely opposed. For example, the Commission recommended, (1) that the Income-tax Officers should have discretionary powers to call for total wealth statements and (2) to deal effectively with persons suspected of having blackmarket dealings, (3) to enter business premises and inspect accounts maintained therein, place identification marks thereon and make copies therefrom, (4) to make a search of places where there are reasonable grounds of believing that relevant books and records are kept, (5) to call for relevant information from Banks and other business houses, etc. In the Income-tax Bill of 1951 also, certain provisions were made more or less on such lines. The Chamber would like to stress that most of these powers are powers of the Police and powers of the Court. (In so far as the Income-tax Bill 1951 provided for empowering the Income-tax Authorities to issue commissions for examining witnesses and to enforce attendance and examine on oath, etc.) The taxing authorities must not be vested with such powers which relate to the civil liberties and fundamental rights of the people.

As to the question of seizure of documents and books of accounts, or powers of search as particularly mentioned by the Commission, the Chamber would strongly suggest that such powers should not be given to the Income-tax Authorities without the previous sanction of a Court of law. Even in that case, the books and documents must not be seized and kept, as this would impede the very earning of income which is the basis for taxation.

The Aiyar Committee of 1937 observed that the "fairly general complaint that the Income Tax Officers do not show enough consideration for the convenience of the assessee is certainly not without foundation", and the Chamber would request the Commission to seriously consider whether any further extension of powers in the hands of the taxation authorities would in any way improve matters.

Question 92.—Creation of Artificial Legal Entities for Avoidance of Income-tax.

Theoretically speaking, it is true that if the load of average taxation on individuals become very high, relative to the load on corporate bodies, then there may be a tendency to create artificial legal entities of various

types. But, the Chamber feels that there is no cause of apprehension at the present for any large increase in the creation of such separate legal entities primarily with the object of evasion of tax. The progress of Corporate types of business in this country would amply prove that there are too many impediments on the way of forming Corporate bodies and if the tax differentials are rationalised there is not likely to be much inducements as hinted in the question.

Moreover, the Company Law is being revised and appropriate measures are likely to be provided to check any large concentration of business in a few hands in the shape of closely held Corporations or what may be called "personal or family holding Companies".

Regarding the question of family partnership, the Chamber considers that family has ever constituted the unit of production in this country and in the opinion of the Chamber, too much impediments need not be created on various counts to disrupt this social institution. Already it has been disrupted by a variety of factors and the Estate Duty Bill recently enacted would further accelerate the disintegration. The apprehension of tax avoidance therefore, through these family partnerships seems to be unwarranted.

Regarding trusts and private limited Companies also, the Chamber would like to say that the purpose of organising such entities may be more than one and it need not be unduly apprehended that everybody would feel induced to take up this type of organisation only for the purpose of avoiding the tax. On the contrary, private limited Companies, Trusts and Family Partnerships should be welcomed as institutions for encouraging Corporate types of business by collective effort. With an undue apprehension for tax avoidance, the growth of these desirable institutions should not be impeded.

The Chamber holds the view that if penalising taxation is brought into the taxing system in respect of the Corporate entities mentioned above, it would impede the growth of Corporate types of business in this country and would not be to the interest of the country. Even if such penalising taxation is introduced it would be very difficult to decide whether such a separate legal entity has been organised with a motive for tax avoidance or for other purposes. The controversies would always be there.

Lastly, the Chamber considers that the issue raised in this question can arise only when large concessions are given in respect of taxing the retained profits of the business and the Chamber presumes that this question is based on an idea of substantial reduction in the taxation of undistributed profits.

Question 93.—Recovery of Unrealised Tax from one Partner from the Firm or from other Partners.

The Chamber considers that the present provisions of Section 26 of the Income-tax Act involve sufficient liability on the co-partners in cases of any change in the constitution of the firm and succession. The Chamber is of the opinion that any extension in the liability of the partners in respect of unrealised tax of any one partner, would make the partnership business too risky. Moreover, it should be considered that though the liability of the partners in a partnership firm is joint and several, these liabilities are only in respect of those incurred in connection with normal business. In no case, therefore, the liability for unrealised tax of any partner can devolve either on the firm or on any of the partners in respect of those incomes earned by such partner outside the business.

Question 94.—Recovery of Income-tax and a separate Enforcement Machinery.

The Committee consider that the present provisions in the law for recovery of income-tax are quite sufficient and there is no need for a separate machinery for realisation of the arrears. The Chamber believes that the pending arrear collections of past years have sufficiently declined by this time and with better and prompter administration in future, the arrears would be small in number.

(The Indian Income-tax Investigation Commission in para. 412 of their Report suggested for a system of examiners and for staggering methods along with improvement in return forms, etc., so as to diminish the arrears. The Chamber does not consider these to be necessary.)

Question 95.—Tax Collections from the Shareholders of Private Limited Companies in respect of Tax realisable from the Companies.

The Chamber considers that if the liability for payment of tax assessed on private limited Companies be imposed on the shareholders of such Companies, then that would mean the very negation of the idea of limited liability attached with such companies. As the Chamber has already pointed out in Question No. 92 the Private Limited Companies should not be too much suspected in consideration of their need for prompting the development of Indian trade and industry on Corporate lines. The Private Limited Company type of organisation have de-

finite advantages particularly under the present conditions of India. The Chamber considers the apprehensions of loss of revenue through formation of private limited companies as rather over-magnified. It would also like to reiterate that the Company Law is being revised and provisions may be made there and the Income-tax Law again need not take upon itself the task of impeding the growth of private limited Companies. It is therefore opposed to the suggestion made in the Question for imposing tax liability on the shareholders of a Private Limited Company for the liabilities of the Company.

Question 96.—Recovery of Tax from Profits in the hands of a person other than the ostensible Owner.

The Chamber is of opinion that the property should be assessed only in the name of its rightful owner. The question whether the ostensible owner is the rightful owner can be decided only by a Court of Law and the Income-tax Authorities should not take upon themselves the responsibility of deciding this question. But if the Income from any property is once included, in the income of a person other than the ostensible owner, and the assessment has been completed, no additional provision should be made for making the tax recoverable from such property again.

Questions 97.—Improvements of Public Relations.

As was explained in the preliminary Memorandum of the Chamber, the improvement in the relations of the Income-tax Department with the assessee can have significant effect not only on the realisation of the tax but also on the tax payers' morale regarding tax compliance. Much would depend upon the attitude with which the assessing Authorities look upon the assessee. One of the greatest hinderance appears to be that there is a feeling among the taxing authorities to consider every assessee as a tax evader and then to feel convinced that he is not so. The presumption is thus against the assessee. In the opinion of the Chamber, the first pre-requisite for better relations is to change this attitude. Each Income-tax Officer must start with the assumption that the tax payer's return is correct and there is no intention of evasion and he should proceed with this idea till it is proved otherwise. The conduct and behaviour of the Taxing Authorities should also provide no scope for creation of a feeling that the assessee is not being properly treated. The assessments must not be such as may provide the least scope to the assessee to feel that these had been capricious, or hurried.

The Chamber is strongly opposed to the present practice of the Income-tax Officers to proceed to levy tax on the basis of estimates of income made in an haphazard and arbitrary manner, without giving credence to the Books and records of the assessee. It has been experienced by the assessee that incomes are assumed for them and taxes are levied which bear no relation to actuality. The rejection of the accounts of the Private Limited Companies, Contractors, etc., has become almost a fashion with the Income-tax Officers.

The recent posting of Public Relations Officers appears to commend adequate confidence so that the assessee may look upon them as dependable guides without any risk.

Regarding the specific measures mentioned by the Commission, the Chamber's views are indicated as under:

Provision for free advice to small assessee: If effective and sympathetic advice can be given regarding the maintaining of account and filling in of returns, so as to facilitate expeditious disposal of assessments, it would greatly improve the tax payers' morale and may also reduce the cost of tax compliance particularly in the case of small assessee. On the question of maintenance of accounts, however, it should always be kept in mind that the large majority of the Indian businessmen particularly those who are carrying on business on medium and small scales, are not practised to organised methods of English accounting. They maintain their accounts in indigenous ways and in different forms. While giving advice for maintaining of accounts in some standard forms, no undue haste be shown for such standardisation of accounts. The accounts maintained by the assessee should be acceptable, while advice for making modifications so as to help expeditious assessments should be given. Gradually, the accounts would get standardised. The present return forms circulated by the Income-tax Authorities with guidance for filling in those forms is considered by the Chamber as a move in the right direction.

Regarding Refunds, the Aiyars Committee of 1937 observed that "the general attitude of the Officers of the Department to refund claims leaves much to be desired". The Chamber considers that this observation stands even now to a considerable extent.

On the question of *provision of information on various matters* relating to assessment proceedings, refund applications, adjournment applications etc., it appears that the present procedures do not require much change excepting that such information should be available to the assessee without any hindrance and much expense.

Regarding the question of arrangement of work, it appears that it should be ensured that the assessee or their Representatives are not to wait for unduly long periods at the Income-tax Offices. There should be weekly and daily programmes of work and in case when a particular assessment cannot be undertaken on the previously appointed day, the assessee should be informed just on appearance and at the appointed hour so that he may not have to wait to know at the end of the day that his case cannot be taken up.

On the question of agreement on facts between the assessee and the Department at Income-tax Officers level, the Chamber considers that this would largely depend upon the framing and the wordings of the law and the rules. The more these can be made objective, the less shall be the scope of difference of opinion about facts even. The difference largely arises because of ambiguities in the law and the rules. It has also been experienced that the Income-tax Officers are not always posted with the facts in the business and therefore cannot agree with what the assessee may say. To obviate this difficulty, the advice and guidance of the Senior Officers should be more readily available and it may also be considered whether responsible men having knowledge of business conditions and facts may be associated in any manner with the Assistant Commissioners for consultation about facts.

Question 98.—Procedural Changes.

(i) *Issue of Notices.*—The Chamber considers that the present provisions do not require any change. The Chamber would, however, like to mention that in the Amendment Bill for 1951, there were provisions for serving notice on any member of the Hindu Joint Family or on any shareholder of a private limited company in respect of the assessments of the family or the Company. The Chamber considers that any such provision would be unjustified in so far as any member other than the Karta in the Hindu Joint Family is not in charge of management and in the case of a private limited Company the shareholders can in no wise be expected to be aware of the day to day position of the Company. Moreover, under the provisions of the Company Bill introduced in the House of the People, every private limited company shall compulsorily have at least two Directors. Therefore, a notice should be served on such Directors or the Principal Officer of such Company.

(ii) *Simplification and filing of Returns.*—As already mentioned, the recent return forms appear to be simpler than previous ones. Regarding filing of returns, the Chamber generally agrees with the recommendations made in paragraphs 196-200 of the Report of the Income-tax Investigation Commission.

(iii) *Penalties.*—About penalties, the Chamber agrees with the Income-tax Investigation Commission that persons who do not submit their returns should not be disentitled from claiming statutory reductions of certain kinds as any automatic penalty of the kind would operate inequitably. The imposition of the penalty should be applied very judiciously as was recommended by the Income-tax Investigation Commission and all encouragement should be given to honest defaulter to come forward and get himself assessed and with this object in view, the penalty should be leniently applied. The Chamber should also like to mention that penalties under the Income-tax law should be kept limited to fines only.

(iv) *Recovery of Tax already paid.*—The Chamber considers that the provisions in the law for recovery of the tax are quite adequate in respect of all sorts of delinquencies, avoidances and evasions. The real difficulty in recovery arises from delay in assessment, and sometimes in the intervening period the tax paying capacity of the assessee undergoes vital change making it impossible for him to make the payment when the assessment is completed. The Chamber believes that tax collection can be much improved by reasonable and prompt assessments than by anything else.

(v) *Appellate Procedure and Machinery.*—The Chamber would reiterate that the Appellate Assistant Commissioners should be dissociated from the Income-tax Department so that it may be possible for them to take more judicial views than at present. In spite of the fact that Government still seems to hold that the Assistant appellate Commissioners have been showing commendable degree of judicial attitude, there is a feeling among the assesseees that it is not practically possible for them, considering such Officers to be after all, human beings having in them a desire for improvement of their prospects in the Department.

Question 99.—Undue Delay in Assessment.

The Chamber has often brought to the notice of the Income-tax Authorities that undue delays are made in the assessment proceedings. It has been found that assessments are delayed for 3 or 4 years and at the end of the limitation period, assessments are rushed through, which appear to the assesseees to be capricious.

The Chamber is not in a position to give any authoritative opinion as to the exact reasons for which such delays are made. It appears that the Income-tax Officers for one reason or the other, do not exhibit much eagerness to complete the assessments in time and sometimes it also appears that they feel to be shaky in taking decisions about acceptance of facts as stated by the assesseees. This may be due to the lack of knowledge and facts as also to the fear of being Departmentally rebuked. In the opinion of the Chamber, the rules and orders should be made clear and objective and greater confidence should be shown by the Income-tax Officers in completing assessments promptly according to his best decisions. Even if such assessments leads sometimes to improper assessments, whether from the point of view of the assessee or of the Government, there may be adequate provisions in the law for revision and review at the initiative of either party.

Question 100.—Excess Profits Tax or Special Business Taxes.

In the opinion of the Chamber, Excess Profits Tax can never be looked upon as a feature of peace-time taxation. In other countries also, this complex type of tax has been brought into existence only in abnormal times of War or semi-War emergencies. The idea of excess profits is a relative idea and it is always difficult to decide what may be considered as excess at any particular point of time. In the USA, this tax was practised during World War I and World War II but on the expiry of the War emergency, the tax was abolished. After the Korean War again, the tax was re-introduced in 1950. The basis for such taxation is "invested capital" method or "base period" method. But under both these methods, innumerable difficulties have been experienced with the result that just on the expiry of the emergencies the tax had to be given up. In this connection the Chamber may just quote the observation that was made by the Secretary of the Treasury of the U.S.A. Government in his Annual Report for 1920 in respect of Excess Profits Tax of 1917-18. The observation was—"the tax does not attain in practice the theoretical end at which it aims. It discriminates against conservatively financed organisations and in favour of those whose capitalisation is exaggerated; indeed many over-capitalised Corporations escape with unduly small contributions. It is exceedingly complex in its administration, despite the fact that it is limited to one class of business concerns—Corporations".

The Chamber has strong objection to the introduction of any tax like Excess Profits Tax in a peace-time economy. This tax acts as a disincentive for risk-taking and expansion, it penalises the firms with fluctuating profits, and it interferes with the very function of profits in stimulating the flow of investment.

The Chamber is opposed to any special business tax.

Questions 101 & 102.—Death Duties.

Though the Estate Duties Act has been made effective, the Chamber would like to reiterate that this measure of taxation has been most inopportune at the present stage of development.

The Chamber is not in favour of any differentiation in the matter of the rates chargeable on self-acquired property and property forming the Estate of the deceased. In the opinion of the Chamber such differentiation would be complex and in cases it may be found almost impossible to decide which portion of the property left by the deceased was inherited and which portion acquired.

PART III.—COMMODITY TAXES.

IMPORT DUTIES.

Question 103.—Revision of Indian Customs Tariff.

In the opinion of the Chamber, the Indian Customs Tariff Schedules, both Import and Export, require revision, for reasons indicated in (ii), (iii) and (iv) in the question.

The Chamber emphasised the question of revision of the Indian Customs Tariff Schedules with Shri P. M. Mukherjee, who was appointed by the Government of India during 1952-53 as a Special Officer for undertaking revision of the Import Trade Control Schedule. The Chamber would recommend that an independent enquiry should be undertaken about the work of revision in details, when suggestions as to the classification and the nomenclature of the specific items should be invited from all commercial interests.

At present, the Import Tariff Schedule is divided into 22 Sections with 87 broad Groups, the different Groups being again sub-divided into a large number of sub-Groups. The sub-divisions and the nomenclature are often broad and do not conform to the present pattern of trade.

Particular problems arise in respect of the classification and nomenclature of the protected items. When an industry is protected, by a high rate of duty, some particular products of such an industry may not be manu-

factured in the country but the duty becomes applicable to all such items also. By way of illustration, it may be mentioned that Outboard Motors and Petrol Powerine Engines of below 7 H.P. at present come under the same item as Diesel Engines in the Schedule. But these two specific types of engines are not manufactured in the country and are being at present considered to be very useful for development purposes especially for remoter areas. Similar observations may be made in respect of items like Ball Bearings, several Motor Vehicles parts, Machinery parts, Chemicals, etc. Extreme difficulties are being experienced in respect of classification of mixed woollen fabrics wherein the descriptions of the items do not conform to the changed practice of manufacture in the supplying countries. Similar difficulties are also experienced in respect of Paper items, Spindle oil etc.

In the Export Tariff Schedule also, difficulties are experienced in respect of the classification of articles like Khaki Water Proof Cotton Canvas, Hospital Rubber Sheetings with textile base, etc.

At the present moment, the Import trade has become much wider in respect of commodities and the Customs Tariff Schedule should be suitably adapted to the changed pattern.

The lacunae in the classification and nomenclature in the Customs Tariff Schedule also affect the administration of Import Control and the merchants are put in an embarrassing position.

Question 104.—Considerations for Fixation of the Rates of Import Duties.

(i) By and large, the rate of Import duty depends upon the nature of the product, its importance in the industrial development of the country, its availability within the country, the nature of the demand for the product etc.

At the present stage of economic development, it seems that Import duties shall have to be relied upon for the purpose of revenue and therefore, the above considerations have to be adjusted to the revenue consideration also.

Generally speaking, the rate of duty on industrial raw materials, plants and machineries and the spare parts which are not manufactured in the country, should be kept low, with drawback arrangements in case the products made out of such imported raw materials are exported out of the country. In case certain materials subjected to revenue import duty are consumed by industry as also by others refund may be given to the consuming industries.

The duties on luxury consumption goods should be higher, but it should not be made prohibitive so as to stop the import altogether. By way of illustration, it may be mentioned that import duties on a large number of items were increased very high early this year, and in several cases imports have not been possible with such high rates of duty. For example, the duties on cotton fabrics falling under Item 48(3) etc. were steeply increased with the result that in spite of liberalisation of the Import Control Policy, it has not been possible to effect import because of the high load of taxation.

Regarding duties that are imposed for protecting an indigenous industry, the Chamber would prefer to reply on the Tariff Commission in specific cases and such protective duties should not be applied on those specifications of the items, the manufacture of which are not immediately undertaken by the indigenous industry.

(ii) In the light of the considerations indicated above duties on items like Outboard Motors, Powerine Engines below 7 H.P., Ball Bearings and Motor Vehicles parts which are not manufactured by the indigenous industry, should be lowered in the interest of the industries consuming or using these articles. The duty on raw materials like Plastic Mould Powder is required to be lowered enabling the Plastic Industry to develop export markets on competitive lines. The Committee also feels that the principle of allowing "Token Imports" in order to promote improvements of quality of the indigenous products would get impeded if the rates of duties on items of such token imports are kept at the increased level to which these were raised early this year. The cases of cotton fabrics and manufactured cotton goods, artificial silk piecegoods, woollen manufactures, etc. would fall in this Group. Similarly, the present high rate of duty on Betelnuts which has been working to be roughly 100 per cent. of the value of the goods, should be lowered in the interest of the consumers.

(iii) It appears that high Import duties on articles like Betelnuts which are available in Pakistan provide incentives for smuggling. A high duty on articles which carry high value in small bulk may also provide incentives for smuggling and such smuggling puts the *bona fide* trade to disadvantage. It is true that smuggling cannot be justified nor should the duties be lowered simply on the apprehension of smuggling if there is other good reasons for high duty. But the Chamber feels that

the fact has to be faced, and the Import duties on the products of the neighbouring countries should be fixed with an eye to the possibility of smuggling because of high duty. In this connection it may also be mentioned that even if Export duty is continued on several items, fixation of the duty at a high rate may provide strong incentives for smuggling the goods out of the country to the neighbouring States, if these goods have ready markets there. There were complaints about such things in respect of cotton textiles when the rate of duty on the different qualities was kept high at 25 per cent.

(iv) No comments.

(v) As have been mentioned in reply to (ii) above, the rates of duties on several semi-luxuries, the imports of which were partially liberalised in early 1953, may be said to be yielding diminishing returns, especially because the Importers have not been utilising the permission for imports because of the high rates of duties. It may be difficult, however, to fully assess the position, as most of these items have been subjected to strict import control during recent years and there have been increase in indigenous supply also in several cases.

Question 105.—The Relative Merit of *Ad Valorem* and Specific Duties.

The issues involved in the relative use of *ad valorem* and specific duties in the Indian Customs were thoroughly examined by the Fiscal Commission of 1921-22 (*vide* Chapter XIV) and the Fiscal Commission of 1949-50 also referred to this examination by their predecessors.

The Chamber generally agrees with the analysis of the Fiscal Commission of 1921-22, regarding the comparative advantages and suitabilities of *ad valorem* and specific duties in respect of import tariff. That Commission recommended that "while the Indian Tariff must continue as at present *ad valorem* and specific duties and tariff valuations, the system of specific duties and tariff valuations might be extended cautiously".

The Chamber would not recommend much extension of specific duties without greater elaboration of the Customs Tariff Schedule in terms of grades, qualities and varieties of the items. Specific duties would not be suitable for those items wherein such specification of the different qualities and varieties may not be possible.

The Chamber is aware that in a phase of falling prices *ad valorem* duties may be advantageous to the trade, but it would like to stress that the application of *ad valorem* duties creates two difficulties for the importer, viz., (a) it brings in an "undesirable character of speculation to import transactions," if the rate is not applied on the basis of tariff valuations, (b) difficulties arise in respect of the assessment of the value on which the rate is to be applied in cases where there is no tariff valuation. The Chamber would therefore, recommend tariff valuation on a more objective basis as indicated subsequently, in respect of all possible items where *ad valorem* duty is per force to be applied.

Regarding protective duties, the Fiscal Commission of 1949-50 recommended that "the system of *ad valorem* duties would seem to offer the best guarantee of protection to indigenous industries". The Chamber generally agrees with this view, but would recommend automatic tariff valuations of the items wherever possible. In respect of revenue duties also, the Chamber would state that it is in favour of the extension of tariff valuation method on objective standards for the purpose of application of *ad valorem* duties. The application of specific duties in unavoidable cases and *ad valorem* duties on the basis of tariff valuations generally, would contribute more to the stabilisation of the Government revenue, and trade contracts.

Question 106.—Assessment of Duty on the Basis of Tariff Values.

(i) & (ii) The Fiscal Commission of 1921-22 examined the question of tariff valuation for the purpose of Customs duty in Para. 273-274. The Chamber considers that use of tariff values (wherever possible) as the basis of assessment of Import duties in respect of those items for which *ad valorem* duty is used, would be better than relying on "real value" basis. The Chamber would generally prefer extension of the tariff valuation scheme in all possible cases where *ad valorem* duties are to be imposed.

(iii) As to the method of determining the tariff valuation, the Chamber is not satisfied with the present procedure. At present the provisional tariff values are annually determined by the Director General of Commercial Intelligence & Statistics and before finalisation the Chambers of Commerce at the ports are taken into consultation. In a communication to the Chamber this year, the Director General explained that the provisional tariff values are determined "on the basis of ex-duty average wholesale market monthly prices at the main importing centres in India during the twelve months ending June weighted by the relative importance of the trade in each particular article in each of the principal

importing centres and modified, where necessary, in consideration of the proposal made by various Collectors of Customs and Central Excise Authorities in India, and also in consideration of the probable future trend in prices." It would be clear from this explanation that too much of subjective elements are brought into the picture and therefore the Chamber feels that the fixation of the tariff values under the present procedure has become a matter of compromise and almost a gamble in estimates.

It would suggest that the basis should be more objective and in this regard the *automatic* valuation method suggested by the Fiscal Commission of 1921-22 appears to merit careful consideration. Under this Scheme, the tariff values are to be automatically fixed every year on the basis of the prices of the preceding 2/3 years, and the Government should publish the monthly prices which would afterwards form the basis for the valuation. The Chamber generally endorses the observation made by the Fiscal Commission of 1921-22 "that a scheme of this nature goes so far in the direction of combining the advantages and minimising the disadvantages of specific and *ad valorem* systems that the Tariff Board might be directed to examine the feasibility and desirability of the extended use of a system based on this principle".

Question 107.—Fixation of "real value" under Sea Customs Act.

Under Section 30 of the Sea Customs Act, the "real value" for the purpose of assessment would be the wholesale cash price less the trade discount for which the goods of the like kind and quality are sold or are capable of being sold at the time and place of importation or exportation as the case may be, and "without any abatement or deduction whatever of the amount of the duties payable for the importation thereof" or where such price is not ascertainable, the costs at which the goods of like kind and quality could be delivered, or the landed cost. In the opinion of the Chamber, the Fiscal Commission of 1949-50 rightly observed that there may be administrative problems involved in the appraisal of value for Customs purposes. It has been experienced that sometimes difficulties are created by putting values at arbitrary figures and assessing the duty on the basis of such values. For example, if a merchant buys certain article on forward contract basis, at a time when the prices were low in the supplying country, and subsequently when the goods are shipped or arrive in India, the market might have gone higher, the Customs have been found to disbelieve the lower invoice price and have attempted to put the higher market price in India or the reported market price on the date of shipment in the supplying country, as the "real value" of the consignment. This really cuts against forward contract which would be naturally very common with the gradual stabilisation in international trade.

In the opinion of the Chamber, therefore, automatic tariff valuation method on the basis of published monthly prices as suggested before would be better. If the prices of the imported items are collected monthly and are published, then these being known to the Importers that in case of doubt the ruling price on the date of the contract or shipment may be used as the real value, the tendency for under-valuation would be conquered. Even where fixation of "real value" would be necessary, if the landed cost is not relied on, the market price in India and in the supplying country on the date of contract and not on the date of shipment should be used for determination of the "real value".

If the automatic tariff valuation method mentioned before is adopted, that would counter the tendency and scope of deliberate under-valuation to a large extent. In respect of residual items, tendency for under-valuation may be there only in cases where there is no tariff value and where the Import duty is very high.

The methods of valuation for Sea Customs Act if modified on the lines suggested above, would also be suitable for land customs. Moreover, as the Chamber has suggested above, the rates of duty on items which pass through Indo-Pakistan border may be kept lower and in that case, the tendency for evasion on the part of the trade would be largely minimised. But fixation of such differential rates of duty seems to involve many other considerations and the Commission may examine the feasibility of this suggestion. The Chamber would also suggest collection and publication of monthly prices of items which pass through such borders and in that case, the subjective element in the valuation would be less.

Question 108.—Special Exemption or Reductions in Import Duties.

(1) Re: Raw materials used by essential industries, the duty should be low and in case the products made out of such raw materials are exported, refund should be granted expeditiously. Provision for such refunds have been made by the Ordinance promulgated in October, 1953, by the President of India.

(2) Some provision for refunds on materials used for scientific research should be made. By a Press Note issued on 20th August 1953, the Government have declared to consider such refunds on *ad hoc* basis. It is restricted to materials supplied free to Government Research Institutions. This should be extended to other Research Institutions also, maintained in the Private Sector.

(3) It may not be administratively feasible for giving special exemptions or refunds on materials imported for charitable and humanitarian purposes, because there may be evasions through it and the established trade may be unduly affected through such loopholes. In exceptional circumstances only, the Government may give such refunds after careful examination of each case on merits.

(4) The Import duty on materials imported for approved development schemes, if made with the specific prior permission of the Government, may be refunded partially in order to lower the costs of such development. But such refunds should be available for the schemes both in the Public and the Private Sectors. Such refunds may be made in terms of Section 23 of the Sea Customs Act.

(5) *Necessaries of Life*.—It would be difficult to distinguish between essential necessities, conventional necessities, semi-luxuries and luxuries and therefore the Chamber feels that excepting foodgrains, exemptions or refunds on necessities may not be possible.

Question 109.—Sacrifice of Revenue for Bilateral or Multilateral Fiscal Arrangements such as G. A. T. T.

Except in the case of Pakistan, Ceylon and other neighbouring countries, on which India may have to rely for selling many of her manufactured articles, it is not likely to be advantageous to sacrifice much revenue in the interest of bilateral and multilateral arrangements such as G.A.T.T. or Commonwealth Preference. In such agreements, however, revenue cannot be the major consideration. Generally speaking, it appears that the concession received in respect of India's exports have not proved very advantageous to this country when related to India's export trade. The value of the exports covered by the direct concessions received in respect of India's exports constituted 18 per cent. of the total value of exports from the country in 1947-48, 12 per cent. in 1950-51 and only 13.5 per cent. in 1951-52. The value of exports to countries covered by direct and indirect concessions was 28 per cent. of the total value of exports from India in 1947-48 and it dropped to 22.4 in 1951-52. These show that India's exports to signatory countries did not increase during the years of operation of the G.A.T.T. Various industries are also coming into existence in India and are progressing, and therefore at this stage it may not be feasible to enter into long commitments in respect of giving concessions regarding Import duties. It has been observed that in respect of certain types of Ball Bearings and Provision Items, Tallow, Lithophone, Dyes and Coal-tar and Coal-tar Derivatives, certain Drugs, etc. the present commitments in respect of Import duties are proving disadvantageous to indigenous industries.

The Chamber would reiterate that special customs tariff arrangements may be entered into with Pakistan and other neighbouring countries provided similar concessions are received from them in respect of India's exports. In this connection, the Chamber would invite the attention of the Commission to the recent action of the Burma Government who have abolished all preferential tariff in favour of Indian articles.

Question 110.—Import Duty versus Import Quota as measure of Protection.

The Chamber would generally prefer the use of Customs duties to restrict imports, rather than quota system. From early 1953, Import Policy has been liberalised in respect of a number of items and the rates of duties have been increased. The Chamber prefers this policy.

In respect of non-protected items import quotas may be used only on considerations of foreign exchange and on a short-term basis.

The issues involved in this question were examined by the Fiscal Commission of 1949-50 and the Chamber agrees with the Fiscal Commission that for purposes of protection customs tariff should be more relied on than Import Control. Every measure of import restriction provides an indirect protection to indigenous industries. But it should not be looked upon as the principal lever for protecting an indigenous industry. The Fiscal Commission rightly referred to the question that quantitative restrictions sever the connections between the price levels of the home country and the outside world, introduces an element of rigidity in the balance of payments and tends to increase Government interference in foreign trade. Moreover, in the case of quantitative restrictions the profits from the resulting increase in internal price of the article goes to a few private individuals whereas under

restrictions emanating from Customs duties the benefit of the resulting increase in prices goes to the Public Exchequer.

Question 111.—Use of 'drawbacks' and ware-housing to assist export of manufactured goods involving use of imported raw materials.

The Fiscal Commission recommended the use of drawbacks on imported raw materials for assisting export of manufactured goods. The Chamber welcomes the recent legislation in this regard and it would emphasise that such drawbacks should be given most expeditiously and irrespective of whether such raw materials might have been imported directly by the manufacturers or might have been purchased in the internal market from the trade.

Question 112.—Administration of Sea and Land Customs Act.

Under the present law, the classifications of items under the Customs Tariff can be legally made by the Appraisement Authorities only after the landing of the goods and the pre-classification that may be made by them on the request of the importers have no legal validity. In the opinion of the Chamber, such pre-classification should be binding on the Customs authorities in cases where the articles have accepted standards or trade marks, or where the importer may deposit with the Customs samples of the goods to be imported. Secondly, the Customs classification of import and export items often appear to be arbitrary and contrary to trade ideas and practices. There have been persistent complaints received by the Chamber in this regard about mixed Woollen Fabrics, Fents, Rubber Sheetings, Waterproof Canvas, Paper items, etc.

In respect of settlement of disputes difficulties often arise in respect of short landed goods and there are too much complexities in settlement of such disputes. Then again, the time limit for filing claims proves sometimes too short for collecting all the documents which the Customs require in cases of appeals. Too much delays are also reported in disposal of claims. It has been brought to the notice of the Chamber that there is a tendency among the Customs authorities to avoid claims in various ways.

Under the present law, the penalties often cause too much hardship on the importers. For example, if an importation is considered to be unauthorised for the time being, then the goods are confiscated but it is not usually taken into due consideration that sometimes such importations become technically unauthorised due to the complexities of the Import Trade Control regulations. Secondly, if such goods are confiscated the goods are offered to the importer at an enhanced price as the cost of the goods. Such penalties should not be considered as penalties and the Customs should clearly declare these as sale-price of the goods so that it may be allowed by the Income-tax authorities as the purchase price of the goods. If such goods are auctioned by the Customs Authorities, and if any buyer other than the importer purchases it, then these are accepted by the Income-tax Authorities as the purchase price of the goods. This anomaly should be changed.

There should be an Appellate Tribunal for Sea Customs disputes on the lines of the Income-tax Tribunals.

EXPORT DUTIES.

Question 113.—Circumstances for Export Duties.

In recent years, export duties appear to have been much relied on as a source of revenue. In the opinion of the Chamber, export duties can be imposed only under the following exceptional circumstances and should never be relied upon as a source of revenue:

(a) If the country has an absolute monopoly in respect of any item and such duty does not lead to retaliatory action in the buying countries on which India may depend for import of her requirements.

(b) Special emergencies like war; or the duties may be imposed for temporary periods on revenue considerations if due to any currency depreciation there may be some temporary 'excess gain' secured by a limited number of exporters in the country.

Under the normal conditions and particularly in respect of commodities which have to face foreign competition in the international markets, the Government should withdraw from the field of export duty. Under the present circumstances when India has programmed to diversify her exports by increasing the export of manufactured articles and when the country hardly holds any monopoly in respect of any item, the present circumstances are unsuitable for continuing export duty on any item. The emergence of a buyers' market in international trade would justify the abolition of export duties. Such abolition is particularly required in respect of Vegetable Oils and Products, and Cloth. The duty on Jute manufactures should be further lowered to rehabilitate

the position of the Indian Jute goods in the world market. In the opinion of the Chamber small rates of Export cess on some products may be levied for securing funds to be spent specifically for promotion of markets for particular products.

Question 114.—Flexibility in Rates of Duty.

In the opinion of the Chamber, it would be virtually impossible to bring about the desired measure of flexibility in the rates of duty to adjust with the changing conditions of the export market. The experiences during the last four years in respect of export duties on jute goods, cotton cloth, oils etc., have definitely proved that it would not be possible to sufficiently adjust the export duties with the changing conditions. There would remain inherent administrative difficulties in making such adjustments at proper time and in adequate measures. These were pointed out by the Chamber in the preliminary Memorandum and in the course of replies to Part I of the Questionnaire. The Chamber therefore would reiterate that the Government should withdraw from the field of Export Duty.

Question 115.—Funding of Export Duties.

The Chamber is opposed to the imposition of export duties except under abnormal circumstances. Even under such emergency circumstances if export duties are levied, then a portion should be funded, for use at a time when export subsidies or bounties may be necessary, or for financing schemes for promotion of the export trade. By way of illustration, the Chamber would mention that if the Government considered it justified to draw out a substantial portion of the profit made by the exporters during recent years, due to international factors and due to devaluation of the Indian Rupee, a portion of such export duties ought to have been kept funded for assisting the export trade of the country now, when the articles are facing serious competition in the foreign market due to rigidities in the cost-price structures in India and lower international prices.

Question 116.—State Trading for Revenue Purposes.

The issues involved in the State Trading in the field of foreign trade were examined by the State Trading Committee of 1949-50. That Committee, made certain recommendations only in respect of a few of the commodities and considered foreign trade as too risky a job for the Government to undertake under the present conditions in India. The Chamber is definitely opposed to the very principle of State Trading, and it feels convinced that except under abnormal circumstances, any effort for State Trading would mean loss of revenue rather than increasing revenue.

Questions 117-123.—Central Excise Duties.

As was observed in the Preliminary Memorandum of the Chamber it appears that with the lowering adjustments in the income-tax, import and excise duties are likely to continue to play a still more prominent part in the Central Revenues. The Chamber also feels that there may be some scope for expanding the orbit of excise duties, though re-adjustments in some of the existing ones are considered necessary. The impact of excise duties is upon the industries or the trade, although their ultimate incidence may be considered to be on the consumer in the long run. While expanding the orbit of excise duty, on revenue considerations, this aspect requires to be kept in view in the selection of the items as also in the determination of the rates. The impact of Sales-tax in the different States needs also be considered in determining the coverage and level of excise duties in order that the total burden of these commodity taxes may not unduly restrict consumption.

In respect of the selection of the commodities, the Indian Fiscal Commission of 1921-22 mentioned a number of considerations, viz., that—

(1) "excise duties should generally be confined to industries which are concentrated in large factories or small areas, (2) they may properly be imposed for the purpose of checking consumption of injurious articles and especially on luxuries coming under this category, (3) otherwise, they should be imposed for revenue purposes only, (4) while permissible on commodities of general consumption, they should not press too heavily on the poorer classes, (5) when an industry requires protection, any further necessary taxation on its products may, if the other conditions are fulfilled, take the form of an excise duty plus an additional import duty. The latter should fully counterbalance the former and may be pitched at a higher rate".

The Chamber generally agrees with these considerations in selecting the commodities for imposition of Central Excise Duties. It would, however, like to add that the industries which may be developed under protection may be specially selected for levy of excise duty when such protection is no longer necessary but import duties on competitive goods are continued on revenue considerations. The level of excise duties in such cases

should be a little lower than the import duty to compensate for consumer prejudice.

The Chamber would also like to observe that under the existing conditions in the country, there would be no way out than to impose excise duties on as many consumption commodities as may be possible without much distinction being made between the so-called luxuries, semi-luxuries, conventional necessities or essential necessities. The convenience of collection and yield would, of course, have to be taken into consideration.

The method of collection should be made as simple as possible and the articles which are used wholly as industrial materials should be generally exempted from excise duties and the duty on others should be refundable when used by an industry on the finished products of which there may be excise duty.

While imposing any excise duty on protected industry, the required adjustments in import duty should also take into consideration the consumers' prejudice against indigenous products.

Subject to these general observations, the Chamber would like to indicate their views on the questions raised in the Questionnaire.

Question 117.—Selection of Commodities.

Among the Central excise duties, the collection from Tobacco and Cotton cloth have been contributing the major share during recent year. In 1951-52, out of a total of excise duties of Rs. 85.78 crores, Tobacco and Cotton cloth contributed Rs. 51.9 crores. In the Revised Estimates for 1952-53, Rs. 46 crores would be contributed by these two items in a total Central excise of Rs. 80 crores in the Budget. For 1953-54, as much as Rs. 56 crores is proposed to be realised from these two heads out of a total provision for Rs. 94 crores as Central excise. Among the excise duties now levied, the incidence of those on Kerosene, Matches, Tobacco (partially), Tea, Cotton cloth and Sugar may be considered to be partially borne by the common people also, who are outside the orbit of direct taxation.

As already mentioned, the Chamber feels that when items like Matches, Kerosene, Cloth or Sugar are subjected to excise duty, Salt and some other necessities of life can also be subjected to excise duty. The Chamber also would like to mention that the Commission may examine whether raw Tobacco and manufactured Tobacco should be both subjected to excise duty. Similarly, it may be examined whether hydrogenated Vegetable products and the Vegetable oils consumed by the Vanaspathi Industry should both be subjected to the excise duty. The idea of the Chamber is that the same commodity should not be subjected to two or more excise duties, once on raw materials and again on the finished products. This may be avoided if refunds are granted when the raw material subjected to excise duty are consumed by an industry, the finished products from which are also subjected to the excise duties.

Question 118.—Rates of Excise Duties.

(i) It has been complained that the burden of excise duties on mill-made Cotton cloth has been proving too heavy for the industry and the trade to bear, and it has been found difficult to shift the incidence on the consumer under the prevailing conditions in the market. Secondly, the cumulative effect of the import duty on Raw Cotton and Sales-tax and excise duty on cloth, appears to be restricting the consumption of Cotton cloth within the country.

Particular complaints have been made against the rates for fine and super-fine cloth. It has been also complained that mill-made Cotton cloth has been subjected to two excise duties, viz., general excise duty plus the additional excise duty for aiding the Handloom Industry, the Dhories being subjected to yet another excise duty at a graduated scale if the production of the mill exceeds the permissible quota of 60 per cent. over the 1951-52 production.

Complaints have also been made against excise duties on Motor Spirit, which has been stated to be largely contributing to the high price of this essential fuel, the material being subjected to special Sales-tax in the different States. The rate of Sales-tax on Motor Spirit is 6 as. per gallon in West Bengal in addition to the Central Excise duty of 15 as. per gallon.

(ii) Ad Valorem Rates :

At present excise duties on most of the items are at specific rates with an admixture of *ad valorem* basis in respect of Matches and Tobacco. The rates of excise duties on cloth were originally on *ad valorem* basis of fine and super-fine and on specific basis on medium and coarse qualities. Subsequently, the basis was changed, and the excise duty on fine cloth, for example, was ranged from 7 pies to 11 pies per yard on Grey and Bleached varieties and from 9 pies to 12 pies on Dyed and Printed varieties, with the option to the mills to pay the duty at the rate of 5 per cent. *ad valorem*. From the beginning

of 1953-54, this alternative basis was changed to specific, fixing the rate at 39 pies per yard on super-fine quality (recently scaled down to 24 pies), 15 pies per yard on fine, the rate on medium and coarse being continued as before. This change in the basis has increased the repressive character of the duty on different varieties of fine cloth, the present specific rate along with a uniform additional rate of 3 pies per yard, works out to *ad valorem* rates varying from a little below 10 per cent. on some varieties of fine cloth to even 30 per cent. on others. The application of specific rates on mill-made cloth which considerably varies from mill to mill, even in respect of the same variety and the same broad group quality, seems to be unsuitable, especially when the rate is considerably high.

The Chamber is not aware of any specific complaint regarding the valuation where *ad valorem* rates are levied.

Question 119.—Excise on Tobacco.

The Chamber would not make any comment on this question, excepting that complaints have been heard from small manufacturers manufacturing Cigars that rates of excise duty on Raw Tobacco coupled with the duty on manufactured Cigars, has been proving burdensome for them. It has also been complained that the preferential lower import tariff on Burmese Cigars is putting these manufacturers under a comparative disadvantage because of this high excise duty.

Question 120.—Excise on Match Industry.

No Comments.

Question 121.—Procedural Matters Re : Assessment and Collection of Excise Duties.

No Comments.

Question 122.—Earmarking of a part of Excise Duties for Expenditure on Research and Development etc.

Generally speaking, the excise duties generally levied on revenue considerations on commodities of general consumption should go to strengthen the general revenues, particularly when many development projects are being financed out of the current revenues of the Central Government. At present, however, there are special excise duties (or Cesses) levied on items like Copra, Oils extracted from Oil seeds crushed in any Mill, Coal, etc., under special Acts and for specific purposes. The Chamber would generally prefer consolidation of excise duties on industry, and in that case portions of such consolidated duty may be earmarked for specific purposes like research and development, improvement of quality and marketability of the products.

The Chamber would, however, like to emphasise that it is strongly opposed to the principle of levying excise duty on one industry and its earmarking for the benefit of another industry, such as the imposition of additional excise duty on mill-made cloth for the benefit of the Handloom Industry or the application of Cess on Oil Mills for the benefit of the 'Ghani' Oil industry.

In case of any earmarking of a part of any excess duty, the earmarking can be made only for the benefit of the particular industry subjected to the duty. The "Benefits Received Principle" should be strictly followed in this type of taxation.

Question 123.—Imposition of Excise Duties *vis-à-vis* Development of Industries and Exports.

As already pointed out in the previous questions, high rates of excise duties on Cloth, Hydrogenated Oils, Motor Spirit, etc., are stated to have affected the particular industries, and also other industries depending upon Motor Spirit. In case of Hydrogenated Oil, provision was made in 1948 for exempting it from the duty if these are used for industrial purposes. If such schemes are extended by arranging the refunds of excise duty in all cases where the products are consumed in another industry, then the restrictive effect on the consuming industries may be avoided. In the case of Cloth, the duty is stated to be restricting consumption.

So far as export is concerned, there is already provision under the Central Excise and Salt Act for refund of excise duty in case the excisable products are exported, if the Government so desired. The Chamber has, however, received complaints that rules regarding refunds are complex and the refunds cannot be obtained easily. It becomes particularly difficult to obtain the refunds in the case when the goods are exported by the merchants out of the market stocks. In effect, therefore, exports get impeded by the burden of excise duty. An effective arrangements should be made for speedy refund of excise duty, almost on a routine basis, whenever the goods are exported out of the country. Such refunds may be made to the exporter on production of export documents.

Question 124.—Re-imposition of Salt Duty.

The question of re-imposition of Salt duty is bristled with many considerations other than economic. The

Chamber is conscious of the political aspect of this duty, but it feels that in the changed circumstances of the country and when the Governments are undertaking many welfare services, the re-introduction of the Duty should be considered justifiable. It is needless to re-iterate that the duty conforms to the time-honoured canons of taxation and its incidence would be very small on the individual consumer. The previous Taxation Enquiry Committee estimated the *per capita* burden of Salt Duty at 3 pice on the basis of an average consumption of half a seer of Salt per month. In 1946-47 the rate of the duty was Rs. 1-9 per maund and the yield of the duty was roughly a little over Rs. 9 crores. The majority of the prevailing import and excise duties do not touch the rural population and the income groups outside the orbit of income-tax. A small rate of excise duty on Salt may give substantial revenue to the Government and through this duty, the entire population may be made to contribute to the development of the country. The burden on any individual would be small.

If the Government feel that the public psychology may still be affected, then the receipts from the duty may be kept earmarked for some specifically approved social services.

In this connection the Chamber would recommend that if excise duty is re-imposed on Salt, the recent levy of as. 2 and as. 3-6 per standard maund in cases of removal of Salt from the licensed Salt Factories or from the Central Government Factories, should be abolished. Secondly, the Salt consumed for industrial purposes, should be exempted from the duty as in the case of several specifications and items of Motor Spirit and Hydrogenated Oils, etc.

SALES TAX.

Questions 125-134.

All these questions appear to have been framed on the fundamental assumption of continuing the Sales-tax, and with as much adjustments as may be possible to diminish its restrictive effects on industry and trade, and to make it as much equitable as may be considered practicable. Before proceeding to indicate the views of the Chamber regarding the specific issues raised in these questions, the Chamber would like to request the Commission to carefully examine the desirability of replacing the Sales-tax by a Purchase tax.

The Sales-tax in India was introduced under the Government of India Act of 1935 and was made a provincial subject. From the beginning it was intended to be a tax essentially on consumption. The impact has been on the industry and trade. The liability of payment of tax has been on the seller and the buyer has no legal obligation to pay the tax. The Sales-tax has therefore been a tax on the margin of the manufacturer or the dealer though there has been a natural process of shifting the incidence to the consumer whenever and wherever possible. The Purchase tax on the other hand, would be a direct tax on the buyer, though the legal obligation of the seller may be continued in the matter of collection and payment to the Government. In a scheme of Purchase tax many of the prevailing difficulties in respect of inter-State trade would not be there. There would be no Constitutional amendment necessary as the States are authorised under the Constitution to tax either purchase or sale of goods. The explanation given to Article 286(1) of the Constitution empowering only the consuming State to levy Sales-tax also seems to presume that the burden of the tax is being borne by the buyer and therefore the Exchequer of his State should get the benefit of the tax. The Chamber would therefore request the Commission to examine the possibility of this change. As the Commission must be aware, in several other countries Purchase tax has replaced the Sales-tax.

With the widening of the States' functions, leading to pressing revenue needs and inelasticity of the older sources of revenue, the States in India have been looking more and more to Sales-tax as the most flexible source of revenue. The State Governments seem to be almost intolerant of any suggestion regarding Sales-tax, presumably due to the apprehension that such suggestions may result in any decline in revenue from this source. This apprehension is understandable from the fact that while the revenue from Sales-tax contributed 11 per cent. of the revenues of the Part A & B States in 1947-48, it rose to 22.5 per cent. in 1950-51. There was a little drop during 1951-52 and subsequent years, due to the constitutional prohibition on collection of Sales-tax on inter-State commerce which was being collected by almost all the States except West Bengal upto 31st March 1951. To cope with the situation, the several State Governments have been trying to increase the yield by changing the basis of Sales-tax, introduction of differential taxation and modification of the list of exempted articles and by various other means. The laws have been thus made more and more complicated, increasing the restrictive and discriminatory effects of Sales-tax on the industry and trade and adding to the burden of the business activities on account of the increase in operational costs.

At the other end, the impact of the tax has been becoming more onerous on the industry and trade with the increasing difficulty in shifting the incidence to the buyer. During the abnormal conditions of the war, and the post-war inflationary markets with high prices and profits, and larger purchasing power with the common man, the undesirable effects of Sales-Tax on prices and industry, were not so glaring as have been during recent times. For example, when the prices were very high and the margin of trade was ten, twenty or even twenty-five per cent., the relative impact of Sales-tax at 9 pies in the rupee or 4.68 per cent. was less than it is now when the trade margin has come down to two, three or four per cent. and there is consumer resistance in the matter of prices.

While the ultimate incidence of Sales-tax may be considered to be on the consumer in the ultimate analysis, and on a long-term view, the deleterious effect of the tax on industry and trade is much more pronounced than on purchasing power or consumption.

The difficulties regarding Sales-tax arise in respect of: (a) *Widely differing burdens of the tax in different States.*—The per capita tax at Saurashtra works out to as. 8 per year and it is Rs. 2-4 for West Bengal, Rs. 12-12 for Madras, and Rs. 3-4 in Bombay. In U. P. the annual per capita tax is a little more than as. 12 and is equal to that in Assam. The people in West Bengal have to bear a burden of Sales-tax of Rs. 2-4 per head per year whereas their neighbours in Assam pay as. 12 and those in Bihar as. 13 and in Orissa a little over as. 8. Though such per capita division of Sales-tax is not very accurate to indicate the burden of the tax, yet the relative position in the different States may be indicated by this means.

(b) *Different basis of Taxation.*—In the majority of the States, the tax is collected at one point whereas in States like Madras, Travancore-Cochin, Mysore and lately Bombay, the tax is collected at every point of sale. There is again combination of both single-point and multiple-point taxing in several States like U.P.

(c) *Difference in Rates.*—The rates vary from 6 pies in the rupee to 2 annas in the rupee even among the States which levy Sales-tax on a single-point basis. There is again uniform rate of tax as in West Bengal and Delhi, and differential rates on different commodities in most of the States.

(d) *Deflection of Trade.*—Sales-tax in West Bengal is at the rate of 9 pies in the rupee and it works out to roughly 4.68 per cent. The transport cost from Bombay to Calcutta for many of the articles like Motor parts, etc. do not exceed 2 per cent. Thus, for a Transport Company requiring these parts for consumption in West Bengal, finds it cheaper to bring the goods from Bombay rather than buy these from the local market and West Bengal has not attempted as yet to realise the tax from the extra-territorial selling dealer in Bombay.

(e) *Pre-Constitution realisation of Sales-tax* by most of the State Governments from despatch of goods outside the State and the post-Constitution efforts to realise sales-tax by several State Governments from dealers or consumers in other States.

(f) *Ineffectiveness of Article 286 of the Constitution* in freeing the inter-State trade transactions and exports and imports, and taxation of commodities which have been declared by the Parliament as articles essential to the life of the community, from the octopus of the divergent and complicated Sales-tax laws of different States.

(g) *Complications of the laws and rules.*—In eagerness to increase the yield of Sales-tax, higher rates, sometimes on differential basis, have been brought in and thereafter various sorts of adjustments are intended to be made. The result has been that complicated rules and procedures have been introduced and the cost of compliance has been increased, particularly for the ordinary dealers.

The restrictive effect of the present scheme of Sales-tax in West Bengal, may be said to arise from:

1. Scope of evasion due to the continuance of the system of registration (and, therefore, point of collection) on turnover basis rather than on the 'category of business' basis and the scope of imports by Unregistered Dealers.

2. Uniform rate of tax on all types of articles at the high rate of 9 pies in the rupee.

3. Taxation of a number of raw materials and other articles which have been declared recently by Parliament as articles essential to the life of the Community.

4. Complicated and long procedure in assessment of tax and examination of books, hearing of appeals, etc.

5. Lack of proper understanding and co-operation between the Taxing Authorities and the taxable Dealers.

The *bona fide* trade has been complaining for some time past that due to the evasion of the tax, the honest

dealers have been experiencing serious comparative disadvantages.

As to the directions for modifications, (if Sales-tax is continued as such), the Chamber would urge for—

(a) Centralisation of Sales-tax by amendment of the Constitution, the yield being allocated among the States on agreed basis;

(b) If complete centralisation is not possible, all inter-State transactions should at least be taken out of the purview of the State Legislations, these being subjected to Sales-tax by the Centre or Purchase tax should replace Sales-tax at least regarding such transactions. There should be no extra-territorial jurisdiction of any State to realise tax from dealers in other States. The jurisdiction of a State to levy tax should be limited to those who deal in the State and not with the State;

(c) Standardisation of Sales-tax coverage and rates in the different States, on a model plan, if the levy of Sales-tax with the State continues to remain as State subject;

(d) Standardisation of the Schedule of exempted articles in terms of the Essential Goods Act and modification of the list in order to include all industrial raw materials and those goods on which the Centre levies high rates of excise duties;

(e) Introduction of a single-point sales-tax system in all the States;

(f) Securing effective exemption from Sales-tax of transactions in the course of export-import trade of India.

In the light of these, the views of the Chamber in respect of the specific questions raised in the Questionnaire are indicated as under:

Question 125.—Sales-tax on Services and Stock Exchange Transactions etc.

(i) Imposition of Sales-tax on services would be virtually taxation of income and the Chamber is opposed to the extension of sales-tax on such services enumerated in the first part of the Question, like Goldsmith's services, Painter's services, Photographer's services, etc. The sales-tax should be only in respect of the goods transferred and not on the charges made in respect of services rendered. In West Bengal, tailoring charges or printing charges, etc. are not subjected to tax if the cloth or the paper is supplied by the customer and the tailor or the painter maintains separate accounts for such cases as distinct from those where the cloth or the paper may be supplied respectively by the tailor or painter himself. In the opinion of the Chamber, in these latter cases also, a portion of the total turnover should be exempted from Sales-tax to ensure that the services do not get taxed.

(ii) The transactions in the Stock Exchanges and the Futures Market should not be considered as transfer of goods and therefore should not be subjected to sales or purchase tax. Moreover, such transactions already bear heavy stamp duty and registration fees.

Question 126.—Sales-tax on Advertisement in Newspapers.

As was pointed out in reply to Q. 34 (f) in Part I of the Questionnaire, the Chamber is opposed to taxation of the sale or purchase of newspapers and any tax on advertisement. The sales-tax on advertisement would add to the business costs and the burden of other taxes and fees is already very high on business activities. Moreover, various Municipalities are already subjecting advertisements under different imposts. The Corporation of Calcutta has framed rules for realising fees for issue of licenses both to advertisers and other Agencies undertaking advertisement on behalf of others. This would be virtually an advertisement tax, in addition to the trade license fees that are collected by the Corporation. The Committee also agrees with the reasons indicated in the question itself regarding Sales-tax or newspapers.

Question 127.—Sales-tax vis-à-vis Excise, Octroi and Customs.

The Chamber does not consider it feasible to merge Sales-tax, Excise duties, Octroi and Customs as raised in the Question. Separation of Sales-tax from the other commodity taxes has been necessary as a measure of adjustment in the Federal Finance of the country which cannot be upset. Sales-tax is a State subject, while the principal excise duties and terminal taxes are Central subjects. The Octroi duties are in practice used only by local Bodies. Moreover, Sales-tax becomes payable only when the sale is effected whereas, all the other levies are made either on production or on the entry of the goods into the respective areas. This difference is of considerable importance to the industry and trade.

The Chamber would, however, like to stress that some sort of co-ordination is required between Sales-tax, Excise duty, and Import duty so that the cumulative burden of all these imposts on the same commodity may not prove to be too burdensome and restrictive of consumption. The Chamber is opposed to terminal

tax and Octroi duty, and the goods already subjected to Excise or Import duty and State Sales-tax should at least be specifically excluded from the orbit of Terminal tax or Octroi.

Question 128.—Computation of Sales-tax on aggregate Turnover Basis and a Sales-tax on Federal Basis.

The Chamber agrees with the view that Sales-tax should be levied in terms of the aggregate turnover of the dealer during given periods, rather than on individual transactions. At present, however, the assessing Officers do check individual transactions at the time of assessments and for which the dealers have to keep themselves prepared for such check up. The present Scheme of turnover basis of assessment, should therefore be made categorical so that the smaller dealers who do not find it possible to maintain Cash Memos and other records for individual transactions, may not have to face difficulty on this count. Generally speaking, the present system of turnover assessment should continue.

(b) On principle, the Chamber is not in favour of imposing sales-tax on different commodities by different specific laws. Such a method makes it difficult for a dealer to have composite business. There is hardly any commodity which is dealt with at present on exclusive basis. Petrol is at present taxed in West Bengal at a specific rate whereas the general Sales-tax is on *ad valorem* basis. This is possible because of the special procedure through which the article is sold.

Question 129.—Multiple Point versus Single-Point Tax.

(1) The Chamber is in favour of the single-point tax system on the West Bengal pattern, but with the following adjustments, so that the basic assumption of the West Bengal Scheme that every article must pass through at least one registered dealer before it reaches the consumers, may be effectively secured:

(a) All Importers of taxable goods into a State should be required to get registered without any turnover limit. At present imports into West Bengal upto Rs. 10,000 a year from other States is permitted through Unregistered Dealers. This provides a loophole and large stocks of goods enter into the State by unregistered importers and such goods remain wholly outside the orbit of taxation within the State and this puts the registered dealers in the State at a comparative disadvantage.

(b) All manufacturers in a State falling within the purview of the Factories Act should be registered without any turnover limit, and for this the existing limit of Rs. 10,000 for registration of manufacturers in West Bengal should be abolished. All new factories should be required to get registered within one month from the date of registration.

(c) Such co-ordination should be established between the Sales-tax authorities and the Carrier organisations as would make it impossible for any importer to bring any goods into the State without the knowledge of the taxing authorities.

(d) Registration of Dealers should be made on a stricter basis to guard against *mala fide* registrations secured for trafficking in Sales Tax Certificates. Registration should be provisional in the first instance requiring submission of monthly returns and on submission of such returns for 12 months and after other check-ups regarding *bona fide*, permanent Certificates should be issued.

On the question of whether the realisation of the Sales-tax should be at the first point of sale (popularly termed as "Collection at Source" System) from the importer or the manufacturer, or whether it should be at the last point of sale from a registered dealer to an unregistered dealer or, a consumer, has proved to be controversial among the merchants. If compulsory registration of all importers and manufacturers without any turnover limit is introduced in the West Bengal scheme and if other modifications as suggested above are made, then the present scheme of "last point" collection should be continued. If however, the *mala fide* registration and avoidance by non-registration cannot be effectively checked then the collection of Sales-tax on single-point basis should be at the first point of sale. In the latter scheme, the indigenous manufacturers within the State who may not come within the purview of the Factories Act would go unregistered and it may be difficult to tax the products of such manufacturers. The volume of such transactions, however, are not likely to be very large. Secondly, the 'dealers' other than the registered manufacturers and importers would be at comparative disadvantage relative to such registered dealers, in so far as their purchases intended for sale to other States would get taxed. Refunds in such cases may be too difficult in practice. The collection at the first of sale may be simpler and easier.

In the opinion of the Chamber, the yield of the Sales-tax in West Bengal would increase if the modifications

suggested by the Chamber are accepted. The yield from multiple-point taxation may be larger but regressive character of the tax and its restrictive effect on industry and trade are much greater under multiple-point system. The cost of collection is also likely to be higher under multiple point system. If on the other hand, the bad aspects of multiple-point system are attempted to be minimised as in the recent Bombay Scheme, then the whole pattern becomes very much complicated adding both to the cost of administration and of compliance.

(2) The comparative merits of multiple point and single-point tax systems have been discussed for long in the country and it is presumed that the Federation of Indian Chambers of Commerce and Industry would be placing all the facts on the experiences of the Sales-tax Acts in the different States which have practised either of these two systems and their combinations, for several years past.

(3) The Chamber would, however, like to just mention in brief their views on the specific points raised in the third part of the Question.

(i) Sales-tax *vis-à-vis* Consumer :

In West Bengal, the single-point tax system has operated since its introduction in 1941. It is, however, felt that there has been considerable evasion by non-registration and registration in mofussil areas seems to have been very low. The imports through unregistered dealers are also reported to be considerable. All these have resulted in a lower yield from the tax compared to the high uniform rate of 9 pies in the rupee. The collection of the tax in West Bengal was Rs. 4.3 crores in 1948-49, Rs. 4.6 crores in 1949-50, and Rs. 4.8 crores in 1950-51, (Revised Budget Estimates) and Rs. 5.6 crores in 1951-52. The Chamber has considered this yield to be rather low compared to the existing high uniform rate.

But this is not due to the system as such. From the latest available administrative Report of the Director of Commercial Taxes (1949-50), it appears that there were only 15,036 firms throughout West Bengal under compulsory registration and 9,436 firms under voluntary registration. Of the total of 24,472 firms only 7,069 were in the Districts and 17,403 in Calcutta. It may be noted here that the present limits for registration are on the basis of turnover and these limits work out to sales of Rs. 833.1/3rd per month for voluntary registration of dealers and for compulsory registration of manufacturers and importers. The compulsory registration limit for dealers also works out to a sale of Rs. 4166.2/3rd per month. These definitely indicate that there has been avoidance by non-registration which must necessarily result in putting a greater burden on the consumer than may be accounted for by the proceeds which accrue to the West Bengal Exchequer.

The Chamber does not consider that the consumer has to pay more under the single-point system than accrues to the Exchequer. The dealer's realisation on small sales is usually fractions of the standard rate and is counterbalanced by non-realizations.

Under the multiple-point system the position of the consumers is worse because the actual burden on a consumer would depend on the number of stages through which the commodity may be passing in order to reach him. Though the rate may be the same, the consumers of different commodities have to bear different incidence of the tax. The scope of evasion is not necessarily minimised under the multiple-point system.

(ii) Sales-tax *vis-à-vis* the Dealer :

The registered dealers in West Bengal are at a comparative disadvantage with the unregistered dealers who sell to the same stream of consumers because of the considerable scale of avoidance of registration and *malafide* registration. Under the single-point system the necessary adjustment in favour of small dealers can be more easily made and the tax has no discriminatory effect against the traders as compared to manufacturers or against the traders at later stages of the flow of goods. Under a multiple-point system there is bound to be a tendency to short-circuiting the goods, resulting in the elimination of a large number of traders, and this would affect employment in the country. Under a multiple-point system inter-State trade and export trade would also get taxed, which can be avoided under single-point system, if the traders having such dealings get themselves registered. By way of illustration, the Cloth merchants in West Bengal generally purchase goods from Commission Agents and thus most of the Cloth coming from Bombay and Ahmedabad has to bear Bombay Sales-tax in practice though Bombay cannot and does not directly levy the tax on exports out of the State.

Regarding the simplification of rules and procedure, the Chamber would suggest the following with reference

to the single-point tax system prevailing in West Bengal :

(i) The names of the Registered Dealers should be published in alphabetical order and Charge-wise. Additions and cancellations should be similarly published and circulated among the recognised Chambers of Commerce within 7 days from the date of each registration and cancellation. At present there is a serious lapse in all these respects and there has not been any marked improvement in these directions in spite of representations.

(ii) There should be a special Department under the Commissioner of Commercial Taxes only for dealing with the files of untraceable firms.

(The Chamber made some suggestions in this line to the West Bengal Government in July last. The work was assigned to Police Department and the Chamber does not consider that the Police Department can secure any effective improvement in these directions).

(iii) The assessment of taxes should be more promptly completed and the assessment procedures should be less complicated and harassing.

(iv) There should be a Public Relations Officer at the Commercial Taxes Directorate for offering correct guidance to Registered Dealers, and thus for creating a feeling of co-operation between the Trade and the Taxing Authorities.

(v) There should be an Advisory Board consisting of the Representatives of the Trade and the Consumers to advise about better administration of the Sales Tax Law and Rules.

As already mentioned, the registration of the dealers should be also made with greater caution.

So far as the forms are concerned, the dealers have not much complaint in West Bengal.

The rules are however complicated and this has increased the cost of compliance in various ways.

In order to make a fresh start, some immunity period should be given for registration without calling upon the dealers to produce books and records for the past, and all pending cases should be composed within such an immunity period if voluntary returns are submitted within such immunity period, as was done in respect of income-tax.

(iii) Sales-tax *vis-à-vis* Industry and Trade :

As have been observed in the preliminary observations above, the divergence of Sales-tax in the different States have affected the organisation of industries and trades in the country. The industries in the States with multiple-point sales-tax have to bear differential burden of the tax than in the States with single-point sales-tax and this differentiation affects the location of industries. The multiple-point sales-tax has a tendency to eliminate intermediaries. The Schedule of exempted goods is bound to be shorter under multiple-point system than under single-point system. Yet another example of the deleterious effect of the multiple-point Sales-tax in Bombay has been recently provided by the piling up of cloth stocks there with the Mills. Had the tax been single-point, the trade would have purchased the stocks for sale outside the State, for exports etc. without incurring tax liability. Thus, the financial burden of holding stocks might have been borne by the Mills and the Trade, as has been the practice of the business.

(iv) Sales-tax *vis-à-vis* Government :

It has been already pointed out, that administration of single-point tax system is bound to be simpler than a multiple-point tax system, and the difficulties arising out of evasion may be better met under a single-point tax system if the suggestion regarding registration etc. as indicated above are accepted.

Question 130.—Differential Taxation.

Excepting West Bengal and Delhi where the West Bengal system of Sales-tax has been introduced with some modifications, differential rates are being applied for different articles in almost all the States of India. On principle, the Chamber is not in favour of different rates of tax levied on different commodities. It would urge for a uniform exemption list of commodities whereupon no sales-tax would be charged in any State. If such an exemption list is introduced there would be no necessity of differential taxation of different articles.

The Committee would, however, like to stress that if the rate is to be kept uniform it cannot be as high as 9 pies in the rupee or 4.68 per cent. as exists in

West Bengal. The maximum rate should be 6 pies in the rupee with a fairly wide Schedule of exempted goods.

In view of the observations made above, the Chamber would not favour any special rate or levy higher than the ordinary rate for certain articles nor would it favour the special rate of levy lower than the ordinary rate for certain articles.

If however, a high rate of Sales-tax is perforce continued or levied, even at the level of the present West Bengal rate, then the Chamber would suggest the preparation on an all-India basis of a list of commodities on which the rate of the tax shall not exceed 6 pies in the rupee in any State.

Regarding the principles to decide the Schedule of exempted commodities, the Chamber would suggest that the goods declared to be essential for the life of the community by the Essential Goods Act of the Parliament, should be all exempt from the Sales-tax in every State.

Secondly, essential consumption goods, medicines, and clothing for the common man (*i.e.*, up to certain price limits) should be exempt from Sales-tax. In West Bengal items like fruits or firewood are also taxed. The result is that the urban population have to bear the burden of the tax on these items whereas these cannot be collected in the rural areas. Such items should be exempted from Sales-tax. Lastly, the items on which there may be heavy excise duty of the Centre should be either exempted from Sales-tax or should be lightly taxed.

Question 131.—Uniformity in Sales-tax System.

The lines of uniformity have been indicated in the preliminary observations made in respect of sales-tax in general. There should be uniformity in respect of the basis of tax, point of registration and collection, exemption list, and rates of tax on similar commodities etc. As to the courses for securing uniformity, as mentioned in the Question, the Chamber would like to indicate their views as under :

(i) It is true that uniformity may be secured by formal or informal convention, but as far as the reports go regarding the last Finance Ministers' Conference and subsequent discussions there seems to be not much possibility of securing the uniformity by formal or informal convention. If the States can arrive at agreed and suitable decisions and if they agree to abide by a Convention, then there would be also no objection in securing the needed constitutional amendments.

(ii) Constitutional amendment promoted at the instance of two or more States is not likely to be binding on the other States and therefore the difficulty would continue.

(iii) If all the points indicated before on which uniformity is required, can be secured by putting the subject of Sales-tax on the Concurrent List in this regard, the Chamber may agree to such a procedure. It would, however, like to stress that in any case, taxation of inter-State transactions should be entirely in the hand of the Central Government.

(iv) No comments.

Question 132.—Uniformity Secured under Clause 3 of Article 286.

The Essential Goods (Declaration & Regulation of Tax on Sale or Purchase) Act, was at last passed by the Parliament in 1952 (*i.e.*, after two and half years after the inauguration of the Constitution), in terms of the Article 286(3) of the Constitution, to secure uniformity in the matter of taxation of a number of commodities dealered to be "goods essential for the life of the Community". The legislation, however, appears to have been made nugatory in so far as desirable uniformity of taxing the essential goods is concerned. The law has been made only prospective and has permitted the continuance of the tax even on the Scheduled goods, if such taxes had been existing before this enactment. The result has been that in most of the States, a number of commodities declared to be essential by Central Legislation, still continue to be taxed. For example, in West Bengal, the following commodities which are scheduled in the Central Act as essential commodities, are subjected to Sales-tax even now :

Sugarcane, Cocoanuts, Vegetable and Flower Seeds, Edible Oils and Oilseeds from which edible oil is extracted (except Mustard oil, Rape oil or a mixture of Mustard and Rape oils), Milk products, and Eggs, Coarse and Medium Mill-made Cloth above notified prices, Handloom cloth above notified prices, Agricultural Machinery, Cotton Seeds, Jute Seeds, Sunn Hemp, Mesta, Cotton Thread, Hides and Skins, Cattle Feeds, Coal including Coke and Derivatives, Iron & Steel.

Secondly, the Central Legislation itself has not declared a number of commodities, which in the opinion of the Chamber, should have been declared as articles essential to the life of the Community. For example,

Vanaspati products, Sago, Cloth of Fine qualities, Quinine, Drugs and Medicines, Firewood, Timber, Cement, Bricks, etc., should have been included in the Schedule of articles of the Central Legislation.

In the opinion of the Chamber, the Central Legislation should have made the State laws inoperative in so far as the taxation of the Scheduled articles is concerned.

Question 133.—Taxation of 'Sales outside the State' and 'Inter-State' Commerce.

It has already been pointed out in the preliminary observations that inter-State trade has become almost impossible because of the extra-territorial jurisdiction that has been recognised for the States by the Supreme Court, in their judgement given in the case of "The State of Bombay and Another *vs.* the United Motors (India Limited) and Others". A dealer in one State who despatches goods to another State as a direct result of the sale for consumption in that second State, is liable to pay sales-tax to that second State. Various States have been calling upon the dealers in other States to get themselves registered in those States. A dealer in Calcutta thus, is being required to get himself registered under the Sales-tax laws of eight, nine or ten different States to which he may be despatching goods for the buyers there. It is needless to emphasise that it is impossible for a dealer to carry on the trade in this way. Such extra-territorial registration of dealers is unworkable for the following reasons:

(a) A seller selling to other States shall have to be conversant with the Sales-tax Acts and Rules in all other States;

(b) Such a seller may be asked to produce his books of accounts before the Sales-tax Authorities in different States;

(c) Such a seller may be called upon to appear personally in different States to which he might have sold goods;

(d) He may be called upon to maintain separate accounts of his transactions not only with dealers in the different States but also with dealers falling under the jurisdiction of the different Sales-tax Officers in these States;

(e) The enforcement of the Sales-tax laws by the different States and realisation of the tax from dealers outside the State would be impracticable for the State Governments and their efforts in these directions can only create deadlocks in inter-State trade.

The difficulties can best be met if Sales-tax is completely centralised. Alternatively, at least the inter-State transactions should be centralised for the purpose of Sales-tax. There must not be any extra-territorial jurisdiction of a State to call upon the dealers of other States to pay Sales-tax to it. A State can at best be entitled to tax for sales *within* the State and not sales effected in some other State with a dealer of the State.

It has been suggested that the Sales-tax should be substituted by Purchase tax at least in respect of inter-State dealings. The significance of this suggestion appears to be that when a dealer or a consumer buys goods from dealers in other States, such a buyer who is within the territorial jurisdiction of the consuming State should be liable to pay the tax to his State and the seller in a different State would not be liable for the tax to the consuming State. There appears to be no Constitutional bar with regard to this suggestion. On the other hand, such partial substitution of Sales-tax by Purchase tax in respect of inter-State transactions only and to the exclusion of intra-State transactions, may make the Sales-tax system in every State more complicated, particularly if some States continue to levy tax on multiple-point basis while other continue to levy the tax on a single-point basis.

The Chamber does not consider it desirable to introduce Purchase tax on some commodities and Sales-tax on others within the same State. The Chamber, would therefore, reiterate that the whole Sales-tax scheme may be replaced by a Purchase tax scheme, if complete centralisation of the Sales-tax is not possible.

Question 134.—Effect of the Lack of Uniformity in Sales-tax on Trade.

The diversionary effect of the divergent Sales-tax basis rates, and rules and procedures, has already been pointed out by the Chamber in the course of the preliminary observations to these Questions and in the course of the replies given to the third part of Question No. 129. These undesirable results can not be avoided unless the measures of uniformity as suggested in the replies to the previous questions are secured.

STATE EXCISES.

Question 135.—State Excise Duties.

The State Excise Duties have been one of the principal sources of revenue to the State Governments,

until recently in some States. So far as West Bengal is concerned, the significance of State Excise to the total revenue has increased. In 1938-39, the realisation under State Excise was Rs. 1.59 crores in a total revenue of Rs. 12.77 crores in Undivided Bengal. In 1946-47 the State Excise accounted for Rs. 6.42 crores in a total revenue of Rs. 39.9 crores. In 1951-52, the revenue from State Excise continued to remain at Rs. 6.72 crores in a total revenue of Rs. 38.59 crores in West Bengal. The Revised Budget for 1952-53 estimates the revenue from State Excise at Rs. 5.73 crores in a total revenue of Rs. 38.29 crores and the Budget Estimates for 1953-54 keeps the figure at Rs. 5.61 crores in a total revenue of Rs. 38.1 crores. In several other States, however, like Bombay and Madras, the revenue declined very steeply during the years 1950-51 and 1951-52. In Bombay, for example, the yield from the duty was brought down to Rs. 1.07 crores in 1951-52 and to Rs. 0.92 crores only in 1952-53 as compared to Rs. 9.74 crores of 1946-47 and Rs. 6.17 crores of 1949-50. In Madras also, the yield became practically nil during 1950-51 and 1951-52. Such declines have been principally due to the adoption of a vigorous Prohibition Policy in those States.

The bulk of the State Excise revenue is realised from duties on liquors and intoxicants and therefore the revenue from this head is directly linked up with the Policy of Prohibition. The Chamber certainly desires that the people in a country like India should be less and less addicted to intoxicants like liquors or ganja etc. but they would like to stress that mere legislation in this regard cannot secure the social objectives in a matter like this. While a State can relinquish its revenues by illegalising the manufacture or trade or consumption of an intoxicant, it does not necessarily follow that those addicted to such intoxicants thereby change their habits. The result becomes that while the State loses the revenue which might have been spent on welfare services and for developmental purposes, the social ills go underground and continue there. It would be interesting to assess if possible, how far the loss of revenue to the States of Bombay and Madras compares with the decrease in the actual consumption of the intoxicants there.

Secondly, the Chamber would like to stress that such prohibition policies, if followed on State basis, may ultimately result in regional inequities in the matter of allocation of financial resources. If certain States relinquish their revenue on State Excise, it would naturally either make attempt to make good the loss through other measures of taxation which may impede the industry and trade or may prove to be equally inequitable from the point of view of the people in general. The Bombay Government's efforts to increase the yield from Sales tax by introduction of multiple-point tax is a case in point. Moreover, if such loss in revenue be replenished (directly or indirectly) by diversion of the divisible pool of income-tax and Central Excise Duties, then the other States get inequitable treatment. The Chamber would therefore urge for a uniform policy in the matter of prohibition and relinquishment of revenue for that, in all the States.

The Commission may also enquire as to the reasons for which the *per capita* revenue on State Excise widely varies from State to State as will be clear from the following figures:

**PER CAPITA RECEIPT UNDER STATE EXCISE
PER YEAR. 1951-52.**

STATE.	Rs.
Pepsu	6.7
Hyderabad	5.1
West Bengal	2.7
Mysore	2.3
Travancore-Cochin	2.6
Madhya Bharat	2.2
Bihar	1.2
Orissa	1.4
Uttar Pradesh	1.0
Bombay	0.3
Madras	0.1

In the opinion of the Chamber, the better course for pursuing the Prohibition Policy would be to tax the undesirable intoxicants at high rates on a uniform basis in all the States, and other conditions about manufacture, warehousing etc. should be more or less uniform in all the States.

GENERAL.

Question 136.—Vesting the Administration with Powers to Alter Import-Export and Excise Duties.

The Chamber is not in favour of giving wide powers in the hand of the Executive Officers to alter by

executive orders the rates of import duties, export duties and excise duties. As has already been pointed out by the Chamber, it considers that it would be impossible to adjust the export duties in adequate manner even if the executive powers are there for making the adjustments. Such powers have already been there and still it has been experienced that there has remained considerable time-lag between the need for adjustment and the actual adjustment. If export duties are continued, such executive powers for adjustments of the duties would be required, but this should be exercised more promptly and at highest levels in consultation with a permanent machinery. All such alterations, however, should be brought before the subsequent Session of the Parliament for its approval.

Question 137.—Extension in the Field of Commodity Taxation.

The Chamber considers that with the progress of the Five Year Plan, the yield from the different commodity taxes are likely to increase. Moreover, by better administration also the yield from some of the commodity taxes like Sales-tax in West Bengal can probably be increased. The Chamber does not consider that there is further scope for imposing any new commodity tax.

Question 138.—Differential Taxation of "Luxury Articles".

The Chamber considers that it would be extremely difficult to single out some articles which may be considered to be 'luxury articles' for all sections of the community. It therefore does not favour differentiation in commodity taxation for different items.

PART IV.—AGRICULTURAL INCOME-TAX, LAND REVENUE AND IRRIGATION RATES.

Agricultural income-tax, land revenue and irrigation rates are all taxes on land. As such, the Chamber does not propose to give detailed replies to the Questions posed relating to these taxes and levies, except in a general way, in so far as these have bearing on the tax system as a whole.

In its preliminary Memorandum submitted to the Commission (para. 5), the Chamber emphasised the need and justification for increasing the revenues from the land taxes. It is only too patent that land revenue and agricultural income-tax contribute very small portion of the total Indian revenue.

So far as West Bengal is concerned, it may be pointed out that while the land revenue contributed 23 per cent. of the total revenue in 1925-26, 25 per cent. in 1938-39 and a little over 10 per cent. even in 1946-47, it has been contributing less than 6 per cent. of the revenues of West Bengal during recent years. No doubt, in an industrial State like West Bengal, the yield from land revenue would be less significant in the total revenue as compared to the position in less industrial States. Still, it would be found that in 1952-53, while land revenue contributed 11.7 per cent. of the total revenue in Bombay, 14.2 per cent. in Madras, 20.4 per cent. in Uttar Pradesh, the proportion in West Bengal was only some 5.7 per cent.

Secondly, the *per capita* levy on account of land revenue varies widely from State to State, ranging from Rs. 0.4 in Bihar and Rs. 0.8 in West Bengal to Rs. 3.2 in Madhya Bharat and Rs. 3.7 in Saurashtra. It appears that with the progress of agrarian reform in the country, more or less on a uniform principle, the scale of land revenue should also be brought at more reasonable levels of comparability, even though exact uniformity may not be possible.

Agricultural income-tax has been so far introduced only in some 8 States and the yield has been contributing very little to the respective revenues of the States, excepting probably Assam and Travancore-Cochin. The agricultural income-tax contributed some 1.8 per cent. of the revenues in West Bengal, 1.6 in Uttar Pradesh, 7.1 per cent. in Assam and 5.1 per cent. in Travancore-Cochin in 1952-53. The rates of agricultural income-tax varies from State to State and in West Bengal it is a progressive rate on slab system, the first slice of exempted income being Rs. 1,500 and the maximum rate being 0.4-0 in the rupee on the slab exceeding Rs. 20,000. The agricultural income up to Rs. 3,000 a year is wholly exempted from the tax. It may be mentioned here that in the income-tax law, the maximum rate is applied at a lower slab (Rs. 15,000) and the rates and the exemption limits are also different. The entire income of the agricultural Companies is taxed in West Bengal at the maximum rate of 0.4-0.

The views of the Chamber regarding the adjustments in respect of agricultural income-tax have been indicated in reply to Question Nos. 53 and 54 of Part II of the Questionnaire. If the integration suggested there is not accepted, and the agricultural income-tax is continued separately, and at State levels, then the Chamber would urge for some sort of uniformity in respect of

graduation, rates, exemption limit and application of the maximum rate. The basis of the tax in that case should also be gross income and some adjustment may be necessary either on the principle of progressive averaging or periodical adjustment.

Regarding Question No. 144, the Chamber would only like to reiterate their view that partial collection of land revenue in kind should be possible, particularly for creating local reserves and/or for financing local development through village panchayats.

Regarding Question No. 151, the Chamber may mention that so far as West Bengal is concerned, there has been some diversion of agricultural land in rural areas for non-agricultural purposes, in connection with the rehabilitation of the displaced persons from Eastern Pakistan. Some lands classed as agricultural also appears to have become part of urban areas as a result of the expansion of Municipal areas in certain cases. In such cases, adjustments in respect of land revenues may be necessary.

Regarding the issues raised in Question Nos. 155-161, the Chamber would like to state that while betterment levies may not be immediately possible, imposition of irrigation rates and small compulsory cess should be considered feasible and desirable. As equal facilities in respect of water, irrigation etc., may not be available to all the lands in a developmental area, consolidation of land revenue, irrigation rate and cess may not be desirable in the initial stages at least.

In fine, the Chamber considers that the yield from the taxes on land can be significantly increased principally by revision of the land revenue system and rates, and the scope for agricultural income-tax and other rates and cesses, are not likely to be of the same significance. The agrarian reforms undertaken in the various States are also likely to decrease the taxable capacity of the agricultural sector, so far as agricultural income-tax is concerned. But with the abolition of intermediary land interests the revenue from land should substantially increase.

PART V.—OTHER TAXES (Central and State)

STATE TAXES IN WEST BENGAL.

The question posed under this Part relate to taxation measures directly affecting the finances of the State Governments. Before replying to some of the Questions, the Chamber would like to invite the attention of the Commission to the fact that the level of internal taxation has been highest in West Bengal during recent years. Excluding the receipts from the Centre, either as grants or as shares in the divisible pools, the percentage of internal tax revenue to the total internal revenue has been 82 in West Bengal on the basis of the average figures for the years 1948-49 to 1951-52, whereas this percentage has been 76 in Madhya Pradesh, 73 in Bombay, 66 in Madras, 65 in Uttar Pradesh and Bihar, 63 in Part B States in the aggregate, 57 in Orissa and 56 in Assam. The percentage of internal tax revenue to internal revenue in West Bengal works out to roughly 74 even in the Budget for 1953-54. This would indicate the dependence of West Bengal finances on tax revenue.

The general position of finance has also been bad in West Bengal and the State has been going on with an increasing trend towards deficit Budget. The public debts has also been increasing. The public debt of West Bengal was Rs. 9.73 crores in 1948-49 and it increased to Rs. 24.39 crores in 1950-51. While most of the other principal States had accumulated Development Reserve Funds during the war and post-war years, West Bengal had no such funds on which it could lean for meeting any developmental expenditure even partially. In fact, West Bengal, the Punjab, and Orissa are the only three Part A States which have no developmental Reserve Funds. All these explain the efforts of the West Bengal Government to increase the revenue of the State by widening and intensifying the coverage and load of taxation within the State.

The Chamber would like to indicate below the trend in the principal heads of taxation in West Bengal since the enquiry made by the last Taxation Enquiry Committee :

STATE TAXES IN WEST BENGAL.

N.B.—1. Figures for years 1925-26, 1938-39 are for Undivided Bengal.

2. Figures are in Rs. lakhs.

HEADS.	1925-26	1938-39	1951-52	1953-54 (B. E.)
TOTAL REVENUE	1298.55	1276.61	3858.80	3815.9
State Excise	228.02	159.35	671.6	560.6
Agricultural Income-Tax	64.8	65.0
Land Revenue	300.57	324.10	209.9	209.6
Entertainment Tax	5.38	7.58	109.8	110.6
Betting Tax	14.43	10.28	56.2	60.0
Motor Spirit Sales-Tax	168.4	110.0
General Sales-Tax	564.0	560.0
Motor Vehicles Tax	21.90	81.5	107.4
Salt Tax	—	13	—	—
Electricity Duty	—	—	94.4	100.0
Stamp Duty	357.98	257.77	292.7	287.0
Registration Fees	38.92	24.12	44.8	42.5

It would be seen that while the total revenue of West Bengal in 1953-54 has been roughly three times of that of the revenue of undivided Bengal in 1938-39, the yield from land revenue has substantially decreased. Secondly, the new items of taxation like general Sales-tax, Motor Spirits Sales-tax, and Electricity duty which were altogether absent in 1938-39 have become crucially important in the State revenues. The yield from Motor Vehicles tax has increased five times as compared to 1938-39 and that from Entertainment tax more than fourteen times. The Betting tax has increased roughly six times.

Among these taxes, State Excise, the Sales-tax on Motor Spirit, and Motor Vehicles tax have been considered to have affected the industry and trade in general. The basis for levy of Entertainment tax has also been objected to. The non-tax sources of revenues of the State have not been earning any significant portion of the revenue during recent years, inspite of the State

Government's undertaking of road transport in Calcutta and Cooch Behar.

On the background of the trends indicated above, the Chamber would give reply to some of the specific questions posed in this Part.

STAMP DUTIES & COURT FEES.

Question 162.—Constitutional position and Question of Uniformity.

It has been complained that the constitutional position in respect of the levy of stamp duties and diversities among the rates in different States have been creating difficulties in cases where the instruments are executed in one State and are to be used subsequently in another State where the rate of duty may be higher than in the first State. The Chamber is of the opinion that uniformity in the rates of stamp duty would be the best solution. Failing this, at least a ceiling rate may

be decided either by Central Government or by the State Governments jointly, beyond which no State Government should levy stamp duty.

Question 163.—Stamp Duty on transactions in forward markets and on other transactions.

The Chamber is opposed to substitution of stamp duty on transactions in Stock Exchange and Futures Markets by any other tax.

The Chamber has no particular experience about the deleterious effects of levying stamp duties on transactions in Forward Markets in Bombay.

Question 164.—Collection of tax through fixation of stamps.

In West Bengal, Entertainment tax is collected in the form of stamps. This requires that the exhibitors must purchase the stamps in advance before the sale of the tickets, involving payment of tax in advance, so to say. The Chamber is opposed to any extension of this method of collection of taxes on the sale of goods. The various license fees are also collected in West Bengal in the form of non-judicial stamps. This may be continued.

Question 165.—Evasion or avoidance of payment of stamp duty.

The documents become non-enforceable if these are not adequately stamped. The Chamber therefore does not consider that there can be much of evasion of the payment of stamp duty. If the stamp duty, however, is made very high on any category of transactions, then there may be tendency to avoid the duty by entering into informal dealings without legally enforceable documents. It cannot, however, be said that such informal transactions are always made with the object of avoidance of stamp duty. Such transactions may be necessary on purely trade considerations also.

Questions 166-167.—Rates of Court Fees.

As the Court Fees are collected in connection with the administration of justice, the rates should be just to cover the expenses. Moreover, the administration of justice should be cheap and uniform throughout India. If it is found that the expenses involved in the administration of justice differ in different States then also a ceiling rate should be fixed by the Centre beyond which no State should be entitled to increase the Court Fees. It may be also considered that in case of uniformity in Court Fees, whether the States wherein the expenses may be higher should not meet the deficits out of other sources.

TAXES ON MOTOR AND OTHER VEHICLES.

Question 168.—System of Motor Vehicles Taxation.

The Motor Vehicles Taxation Enquiry Committee examined the present system of taxation of Motor Vehicles and they pointed out that the tax burden on Motor and Motor Vehicles was highest in India and that there were too many taxing authorities and multiplicity of taxes. That Committee also stressed that the basic approach that Motor Vehicles were luxury items should be revised. The Chamber generally agrees with this analysis of the Motor Vehicles Taxation Enquiry Committee. Motor Vehicles taxes should not be viewed as luxury taxation, as Motor Transport has significant bearing on industry and trade and are in a way essential public utility services. The Railway Transport facilities are not adequate and the Planning Commission also appear to be in favour of developing not only feeder road transport but also parallel road transport, to supplement railway transport. The whole system of taxation should be viewed from this angle.

Secondly, the Motor Vehicles Taxes should be principally applied on the benefits-received and cost-of-service principles. The revenue consideration should be of secondary importance.

Thirdly, though Motor Vehicles taxation may continue as a State subject, the various State laws should not be allowed to impede inter-State transport of goods on road.

In the opinion of the Chamber, the number of taxation authorities should be lowered by abolishing the local taxes on Motor Vehicles wherever existing, while the share of State taxes may be given to the local authorities who are in charge of maintaining the roads within their respective jurisdictions. At the present stage of development of road transport, too much emphasis need not be given on taxation of Motor and other Vehicles for purpose of general revenue. As has been indicated above, the Motor Vehicles tax was only Rs. 21.9 lakhs in 1938-39 and Rs. 34.7 lakhs in 1946-47 in Undivided Bengal. It was increased to Rs. 81.5 lakhs in 1951-52 and the estimates for 1953-54 has been for Rs. 107.4 lakhs. The rates on vehicles for carrying passengers plying for hire as introduced from 1st July 1951, have

been considered to be very high and burdensome, and the fares on public vehicles have also been increased as a result of such high taxation. The rates on the vehicles for the transport of goods have also been considered to be high, increasing the cost of transport to industry and trade.

The Sales-tax on petrol in West Bengal is now 0-6-0 per gallon and there is a Central Excise duty (or Import Duty) of 0-15-0 per gallon. The Chamber considers that the total commodity tax on petrol is thus very high and should be lowered by proper adjustment in these two levies.

Question 169.—Earmarking of Motor Vehicles tax for road maintenance and development.

The Motor Vehicles Taxation Enquiry Committee recommended that a portion representing 7 annas of the import duty on fuel collected by the Central Government should be earmarked for road development by transferring it to the Central Road Fund. That Committee also recommended that 4½ annas out of it should be allocated among the different States on the basis of consumption of petrol. The Chamber agrees with this recommendation, and it also holds the view that a portion of the States Sales-tax on Motor Spirit should be earmarked for maintenance and development of roads, such State pool being allocated among the local authorities. It should be ensured that such funds are actually spent for development and/or maintenance of roads.

Question 170.—Opinion on the recommendations of the Motor Vehicles Taxation Enquiry Committee of 1950.

The Chamber is in general agreement with the principal recommendations of the Motor Vehicles Taxation Enquiry Committee.

Question 171.—Taxation of Users of Roads other than Motor Vehicles.

The vehicles using roads other than Motor Vehicles have to bear certain fees levied by the local authorities. The Chamber is not in favour of further extension of taxation of these users.

Questions 172-175.—Entertainment Tax.

The realisation from Entertainment tax was only Rs. 7.6 lakhs in 1938-39 and Rs. 47.0 lakhs in 1946-47 in Undivided Bengal and the tax has been made to contribute roughly Rs. 110 lakhs during the last two or three years. The present rate of Entertainment tax in West Bengal is as under:—

RATE OF ENTERTAINMENT TAX IN WEST BENGAL.

Price of Ticket (Exclusive of Tax.)	Rate
Up to 0-3-0	Nil.
More than 0-3-0 but less than Re. 1	25 per cent.
More than Re. 1 but less than Rs. 3	50 per cent.
More than Rs. 3	75 per cent.

This steeply graduated rate was introduced from 1st April 1949, in place of the previous Schedule of rates which divided the tickets into 11 different slabs and the tax varied from 6 pies to Re. 1 on tickets up to Rs. 3-8-0, the tax on tickets of higher value being 1/3rd of the price. It would be thus seen that the maximum rate was 40 per cent. up to 31st March, 1949, in place of the present 75 per cent. The increase in the rates has thus been very steep requiring lower adjustments.

The Committee are not in a position to say whether the rates have reached the point of diminishing returns.

On revenue considerations, the question of uniformity in Entertainment tax cannot be pressed for at this stage of development of the country. After all, it is an indirect tax where the shifting of the incidence is comparatively easy.

Regarding graduation in the rate, the Chamber would like to suggest that the rate of Entertainment tax should not be as progressive as it is now in West Bengal. It would also urge upon the Commission to carefully consider whether it would not be better to replace the present graduated rate by a proportional *ad valorem* rate, with exemption up to a certain price of the ticket. That would also mean higher taxation of those who use better facilities for entertainment.

Question 173.—Exemption from Entertainment Tax.

The object for which the net receipts are applied should be the main criterion for exemption. The educational films should be exempted. The Chamber has no objection to exempting the lowest class of tickets from entertainment tax. The entertainment that may be provided only for children may also be exempted from tax.

TAXES ON CONSUMPTION OR SALE OF ELECTRICITY.

Question 176

The Electricity duty in West Bengal has been yielding higher and higher revenue to the State coffers. It yielded Rs. 57.6 lakhs only in 1946-47 in Undivided Bengal, and has been increased to yield Rs. 100 lakhs in the Budget for 1953-54.

On revenue consideration of the State, it appears that consumption or sale of electricity for domestic purposes may be subjected to small rate of tax in all the States.

The Chamber would, however, urge for exemption of industrial use of electricity uniformly in all the States.

Question 177.—Distinction for Domestic Use.

The Chamber considers that consumption of electricity on Frigidaires, Heaters, Radios etc., should be subjected to lower rates of tax. Such consumption is also charged at lower rates by the supplying companies.

The Chamber would also like to mention that in West Bengal, the State Government is extending electricity connections for domestic consumption in certain areas by taking the energy from private Companies and for such extension the Government rate is higher than the rate of the supplying companies. In such cases, exemption should be given to the domestic consumers even in respect of fans and lights.

Question 178.—Energy Used for Industrial Purposes.

The Chamber is not in favour of imposing duty on industrial consumption of electrical energy. It is a tax on production. If, however, the tax is at all continued, there should be no discrimination between such consumption by private undertakings and public undertakings. Secondly, smaller and newer enterprises should at least be exempted from this duty.

In this connection the Chamber would also like to mention that at present in West Bengal consumption of 15 or lower units is exempted from tax and the rate is 6 pies for each unit if the consumption is between 15 and 50 units. The rate on consumption of over 50 units is 0-1-0 per unit. The Chamber is not in favour of such graduations in the rate of electricity duty.

Question 179.—Differentiation between Public and Private Undertakings.

The Chamber is opposed to any differentiation between private and public Undertakings supplying electric energy. If, however, a Government Undertaking purchases the energy from a private Undertaking, and then supplies it to the private consumers, at enhanced rates, for covering the expenses of the Government Undertaking, then there should be no duty on such supply.

Question 180.—Uniformity among the Different States.

The Chamber does not consider it feasible except that the industrial consumption of electrical energy should be uniformly exempted in all the States.

Questions 181-183.—Betting Tax and Prize Competition Tax.

The yield from the Betting Tax was Rs. 10.3 lakhs in 1938-39 and Rs. 117.9 lakhs in 1946-47 in Undivided Bengal. The rate of the tax was reduced in December 1950 from 20 per cent. to 12½ per cent. and the yield in 1951-52 was Rs. 56.2 lakhs. The Chamber presumes that this adjustment in the rate was to avoid the operation of the law of diminishing returns in respect of this tax. The Chamber has no further comment to make about evasion of the tax or the advisability of increasing the rate. It has been suggested that lotteries, cross-word puzzles, riddle solutions etc., may be subjected to some sort of taxation.

PART VI.—LOCAL TAXATION

The issues involved in respect of local taxation were examined by the Local Finance Enquiry Committee. Before giving replies to some of the specific questions posed by the Commission, the Chamber would like to invite the attention of the Commission to the finding of the Local Finance Enquiry Committee that the overall average of local taxation works out in India to roughly Rs. 1-1-0 and as a proportion of the *per capita* National income the local taxes account for less than ½ per cent. It was also mentioned by the Local Finance Enquiry Committee that the burden of local taxes in England constituted 2.7 per cent. of the *per capita* National income in 1949-50.

From the figures collected by the Local Finance Enquiry Committee for the year 1946-47, it appears that in respect of local Taxation, the burden was Rs. 18-12-3 per head per year in the three City Corporation Areas, Rs. 4-11-10 in other Municipal areas and 0-4-1 in District Board Areas. It was explained in the Preliminary Memorandum of the Chamber (in paragraph 9 on page 32), that the bulk of the indirect and direct taxes are now borne by the urban population and from the figures mentioned here it would be found that the local taxes

on these very urban population are again considerably high in addition to the Central and State taxes. The Local Bodies excepting the City Corporations are mostly financed out of the State revenues which are collected principally from the urban areas. For example, in 1950-51, of the total Sales-tax of Rs. 5.2 crores collected in West Bengal, Rs. 4.2 crores was collected in the City of Calcutta; of Entertainment tax Rs. 72 lakhs in a State total of Rs. 105 lakhs; of Electricity duty Rs. 82 lakhs in a State total of Rs. 86 lakhs; and in State Excise, Rs. 306 lakhs in a State total of Rs. 620 lakhs. Of the other taxes also, Rs. 188 lakhs collected in West Bengal in 1950-51, Rs. 155 lakhs was collected in the City of Calcutta. The distribution of the taxes between the Cities and the *Mofussil* areas seems to be a little more even in the States of Bombay and Madras. In the opinion of the Chamber, the whole pattern of local finance should be examined by the Commission in order that some more funds required by the local Bodies in the rural areas may be raised locally.

For this purpose, wider powers may have to be given to the local Bodies for raising such funds, without hampering, however, free flow of goods and services among different regions within the State.

The Chamber agrees with the finding of the Local Finance Enquiry Committee that the scope of taxation by local Bodies in India is very limited. It appears that excepting the three City Corporations, all other local Bodies are being generally run principally on the doles received from the State Governments. The Chamber is in favour of changing this position and of ensuring certain sources of income to the local Bodies, both by reserving certain items only for local taxation and by apportionment of the yields from a number of States taxes, like Entertainment tax, Motor Vehicles tax, Petrol tax, etc.

In this connection, the Chamber would also like to observe that in a vast country like India, local Bodies have to be more relied on and the Directive principles of the Constitution also appear to have laid emphasis on building up the democracy in India from the bottom level of "Gram Panchayats". The local welfare services are required to be performed principally by the local Bodies and while it must be ensured that these services are rendered efficiently, it should be also ensured that adequate funds are available on a stable basis and independent of the likes and dislikes of the State Governments.

The Chamber agrees with the opinion of the Local Finance Enquiry Committee that "wholesale transfer of functions from local Bodies to State Governments is a retrograde step and should be avoided", and that "in the new set-up local Bodies will be used more and more as instruments of National policy and there would be a steady enlargement of their functions".

Questions 185-199.—Powers of Taxation.

About these questions relating to the powers of taxation of local Bodies, the Chamber generally agrees with the recommendations of the Local Finance Enquiry Committee about the sources of revenue the net proceeds of which should be made exclusively available for the local authorities. That Committee, however, envisaged establishment of convention for securing the object.

The Chamber does not favour the imposition of "terminal taxes on goods or passengers carries by Railway, Sea or Air". If, however, there is any such tax, it should be available to the local Bodies as recommended by the Local Finance Enquiry Committee.

As has already been mentioned, the Chamber would suggest the allocation between the State Governments and the local Bodies of the collections from Entertainment tax, Motor Vehicles tax, Electricity Duty and Petrol tax.

The Chamber has already mentioned that it is not in favour of making the local Bodies principally dependent upon grants-in-aid from the State Governments.

The Chamber does not favour the imposition of Octroi or Tolls by local Bodies and even if these are levied, it should be ensured that these do not impede the flow of trade and commerce among the different regions. So, such levies should be made on a uniform basis within a State.

It is a general complaint that local Bodies often fail to make full use of tax resources available to them, and before utilising their own sources, they ask for grants-in-aid from the State Governments. The Chamber is of the opinion that grants-in-aid should be allowed only in the last resort and if the financial resources are once scheduled for the local Bodies, then before sanctioning any grants-in-aid, a local Body should be required to prove that the internal resources have been fully utilised.

Question 201.—Valuation method for Property Tax.

The Chamber agrees with the recommendation of the Local Finance Enquiry Committee that "there should

be no change from the well-tryed basis of rent to the more or less uncertain basis of capital value". The rent should, however, be the actual rent recovered or recoverable. This basis should be uniformly followed in all the urban areas, and the Municipalities adopting the capital value as the basis should also gradually change to the rent basis.

Question 202.—Urban Immovable Property Tax.

At present this tax is levied only in two States of India, *viz.*, Bombay and the Punjab. The local Finance Enquiry Committee recommended that there should be obligatory provision for imposition of this tax by the City Corporations. The Chamber does not favour the imposition of an Urban Immovable Property Tax where it is not already existing. It would also suggest the scaling down of this tax where it is existing. The incidence of tax on property is already high in the Corporation areas of Calcutta and imposition of an Immovable Property Tax would prove too burdensome and would discourage building activities which are imperatively needed.

If, however, the tax is at all to be levied, it should be done by the Corporation. Multiplicity of taxes on urban property should be avoided and this is also another reason against the imposition of an urban immovable property tax in Calcutta or similar other urban areas.

Question 203.—Exemption from General Property Tax.

In the opinion of the Chamber, properties the rateable values of which fall below certain stated amounts should be exempted from taxation. This may be particularly necessary because of the fact that in many cases such properties may be the only source of living for the owners who may be widows, or even minors or disabled persons. In Calcutta, the Municipal Corporation can exempt from tax, at its option, properties the rental value of which does not exceed Rs. 50 per year. This limit appears to be rather too low and it may be increased to Rs. 250.

So far as the exemption of the charitable institutions, educational trusts etc. are concerned, the Chamber generally agrees with the recommendation of the Local Finance Enquiry Committee that the list of such institutions should be subjected to periodical review and each municipal body should maintain a list of such exempted institutions. In Calcutta, such exemptions require the sanction of the State Government. The Chamber, however, feels that Co-operative Housing Societies should not be entitled to such exemptions. The Chamber would also like to suggest that the properties used for educational, charitable, or religious purposes should at least be charged at concessional rates even though these may not be wholly exempted from the property tax. In Calcutta, land or building used exclusively for the purpose of public worship, burial or burning ground are exempted from the consolidated rate of the tax, and the exemption of land or building used for purposes of public charity may be given at the option of the Corporation.

On the question of remission for vacancy, the Chamber considers that the Bombay practice of remission to the extent of 2/3rd of the property tax, in case the property remains vacant for 60 consecutive days or more, should be introduced in all the States. The Chamber would particularly like to urge for exemption of new buildings during an initial period of at least two years from the date of completion of the building. Similar exemption has been also given in the Income-tax Law in order to encourage building activities.

Question 204.—Progression in Property Tax.

The Chamber is opposed to any progression in property tax. The Local Finance Enquiry Committee was not also unanimous on this issue. The income from property is already taxed progressively. The Income-tax Law and the Estate Duty would be another imposition on succession of property. The Local Bodies again should not therefore, go in for applying the principle of progression in taxing the properties. In Calcutta, a slab system exists for levy of the consolidated rate of property tax upon all lands and buildings. The graduation is as under :

Annual Value	Rate of Tax
Up to Rs. 1,000	15 per cent.
Rs. 1,001-3,000	18 per cent.
Rs. 3,001-12,000	22 per cent.
Above Rs. 12,000	23 per cent.

It is also provided under the Calcutta Municipal Act 1951, that where the annual valuation exceeds Rs. 3,000 the maximum percentage may be increased up to 23 per cent with the approval of the State Government. The

actual levy of the consolidated rate is determined annually subject to the above mentioned graduations. It has been stated that the Calcutta Corporation loses a sum of about Rs. 15 lakhs a year for the benefits given to small buildings. The Commission may, therefore consider whether a proportional rate may replace the present progressive rate.

Question 205.—Authorities to levy Property Tax.

All categories of local Bodies should have the power to levy property tax within their respective jurisdictions. But the maximum and minimum rates may be fixed at State levels.

Question 206.—Procedure of Assessment and Collection of Property Tax.

The assessment of Property tax has been considered to be often arbitrary, particularly for local Bodies other than City Corporations. The arrears of collection have also been reported to be always heavy. The assessment should be made by all the local Bodies within a State, on some uniform principle, and better administration can only diminish arrears of collection.

Question 207.—Service Taxes *vis-à-vis* Properties of Public Bodies.

The Chamber does not consider it objectionable to levy service taxes on the same basis as the general property tax. In fact, such service taxes like those for water supply, street lighting, drainage and conservancy etc. may be consolidated with the property tax. If, however, the different areas within the same Municipality obtain different treatment in respect of the services or if the rate-payers in certain types of properties do not get the services as others then the consolidation of service taxes with the property tax may reasonably be objected to. In such cases the effort should be to extend the services on a uniform level rather than going in for differential taxation.

The Chamber does not find any justification for preferential treatment towards the properties of the public bodies like, the Port Trust, Railways, Central Government and State Government. The properties of such public bodies should be subjected to the same rate of property and service tax as applies to other properties.

Question 209.—Octroi and Terminal Tax.

The Chamber is not in favour of Octroi and Terminal Taxes. The imposition of these taxes creates artificial barriers in the free flow of trade.

Question 210.—Substitution for Octroi and Terminal Taxes.

The Chamber does not favour the levy of surcharges on Sales-tax by the local Bodies as suggested in the Question. In its opinion a portion of Sales-tax may be divided among the local Bodies on the basis of collection.

Questions 211-213.—Octroi and Terminal Taxes.

The Chamber has already pointed out that it is opposed to levy of Octroi or Terminal taxes.

Question 214.—Extension of the Nationalisation of Motor Transport.

The Chamber does not favour further nationalisation of Motor Transport. The State Transport Organisation in West Bengal has been a losing enterprise. The Chamber is opposed to the terminal taxes and therefore the question of facilitating its collection by nationalisation of Motor transport does not arise.

Question 217.—"Pilgrim" Tax and Taxation of Floating Population.

The Chamber does not like to make any comment on "Pilgrim" Tax.

It would, however, like to mention that the question of some sort of taxation of floating population who daily come to the City areas is very important for the Cities like Calcutta. The last Census has disclosed that only some 25 lakhs of the people inhabit the City of Calcutta in the night whereas it has been estimated that not less than two lakhs of people come daily to Calcutta through the two Railway Stations alone and the passenger traffic within the City has been estimated to be roughly 45 lakhs. All this vast concourse of people put serious strain on the City. The Calcutta Corporation has to provide amenities for all these floating population. The Commission may kindly examine the feasibility of collecting some tax from this floating population for the benefit of the big cities like Calcutta.

Question 218.—Poll Tax.

The Chamber does not consider it feasible to levy a Poll Tax in India whether as a form of local and/or State tax. A Poll tax is not considered to conform to

modern concepts of justice in taxation. Within a local area, such a tax may secure some contribution from the local people for local development and in the U. S. A., the Poll tax gained ground during recent years as a revenue raiser for small and medium units of local Government. But there too, it has been considered that the contribution of the people in general to the Government or a local Body may be secured through other measures. The Poll tax being a direct tax on every person may also be an unpopular measure, which the local Bodies may not like to resort to. A Poll tax in rural areas payable either in money or by labour or service may however secure the participation of the local people in local developmental and welfare activities.

Question 220.—Raising the Constitutional Limit of Profession Tax.

A. The Constitution lays down the limit of profession tax in a State at Rs. 250 per head per annum. In view of the high load of income-tax, the Chamber does not consider that this limit should be increased.

Question 228.—Contribution of Labour as Payment for Tax.

A. In its preliminary Memorandum submitted to the Commission, the Chamber explained that if the services of the local people could be secured for local development, the revenue needs of the Government might be diminished and thus such services might be considered as service taxation. The Planning Commission in paragraph 34 of their Report also emphasises that "there are a variety of ways in which idle manpower and spare hours of those partially employed can be canalised into a Nation-wide programme of developmental activities. In the digging of canals, repair and renovation of tanks, construction of roads, bridges and bunds, rural housing, improvement of sanitation, in the imparting of elementary education and technical training and in several other activities, there is scope for participation of all sections of the population". The Chamber therefore feels that such participation can be made possible if provision is made for payment of certain taxes in terms of manual labour or service.

BOMBAY CHAMBER OF COMMERCE.

REPLIES TO THE QUESTIONNAIRE OF THE TAXATION ENQUIRY COMMISSION.

PART I.—THE TAX SYSTEM

Question 1.—What, in your opinion, should be the objectives of a sound tax policy? What should be the place in such a policy of the following objectives:

- (a) reduction in inequalities of income and wealth;
- (b) encouragement of incentives to work, to save and to invest;
- (c) countering of inflationary and deflationary tendencies; and
- (d) maintenance of the external balance of the economy?

In what directions would you suggest modification of the Indian tax system having regard to these objectives?

The main objective of a sound tax policy must be to increase production and so raise the standard of living. If the main objective is to be realised

- (a) the taxable capacity must be fairly determined, taxation accordingly imposed, and thereafter not increased; certainty and stability are essential if capital is to be made available for investment in whatever sectors of the economy;
- (b) there must be a competent administration; the machinery for the collection of revenue must be effective otherwise taxation must be increased beyond the taxable capacity.

If there is incentive to work, to save and to invest there will be an accumulation of wealth by personal or community effort and production; from that accumulation the appropriate quantum can be channelled by taxation to the revenue. But if accumulations are to grow and production expand, the quantum of the accumulation left in the hands of the individual or the community must be such that the assets with which the wealth is created can be maintained in a condition in which they may continue to increase.

Savings and investment must be encouraged by all possible means but without direction of savings into particular channels; the risk differential will operate to ensure that available resources will be correctly employed. The reactions of the natural laws of supply and demand will control the inflationary and deflationary tendencies in the economy and it should not be the objective of taxation policy, as distinct from monetary policy, to attempt to regulate supply and demand. If the inflationary and deflationary tendencies are allowed to adjust themselves, the external balance of the economy will automatically find its own level.

It may be necessary, at times, to resort to controls, physical and monetary, but controls should not be regarded as an inevitable constituent of an overall State policy. Controls should be used only to deal extraordinary circumstances which have disrupted the working of the natural economic laws since they are usually too late when imposed or revoked to effect a cure.

In a country dependent upon exports of primary products for its external balance of trade, taxation of the exportable product must be such that it is not priced out of its markets whether by direct internal taxation or by export duties. Export duties may destroy the competitive power to sell in world markets. The levy of an export duty on commodities which enjoy a monopoly or near monopoly in source of supply, (e.g., jute and manganese) causes overseas buyers to look for substitutes or to seek alternative sources of supply. The first has happened in the case of jute and the second is about to happen in the case of manganese. The principle should be to sell at the best price obtainable in the export market leaving it to well-organised trade associations to adjust their production, selling arrangements and prices in a market which they understand and which, for their own benefit, they will do everything to preserve.

While the reduction of inequalities of income and wealth is desirable it cannot be a primary objective since in the result over-all living standards may thereby be reduced.

Taxes should be levied over the whole population, equitably according to ability to pay but in no case so severely as to impair incentive. A sound tax policy will not destroy the incentive to work, to save and to invest; the Indian tax system, in the opinion of the Chamber, should be modified in a number of ways as indicated in the Chamber's replies to other parts of the questionnaire.

Question 2.—What criteria would you suggest for determining the equity of a tax system? How far is it possible to secure it in the Indian tax system?

Question 3.—Does the Indian tax system conform adequately to the principle of ability to pay or do you think an extension of this principle is desirable and practicable? If so, in what ways?

Question 4.—Differing views have been expressed on the extent to which the taxable capacity of various sections of the community has been used by the Indian tax system. What is your view on the subject?

A tax system should be simple, plain and intelligible to all, whether they fall within its incidence or not; the imposts should be easy to calculate and to collect; liability should be apparent and determinate; evasion should be as nearly impossible as human ingenuity can devise. The severity of the levy should not normally exceed the revenue needs of the State and capital undertakings should normally be financed by loans. Schemes, however presently desirable, must be carefully co-ordinated to available finances whether from taxation or loans.

So long as incomes from agriculture are exempted from charge to income-tax it cannot be said that the system conforms adequately to the principle of ability to pay. An extension of the principle is to that extent at least desirable and practicable.

The present tax system in India developed during times when ease of collection was undoubtedly the paramount consideration. That resulted in a concentration of the tax burden on the salaried classes, trade and industry. The agricultural and industrial labouring classes were disproportionately poor and were largely untaxed except in so far as indirect taxes on consumable articles (e.g., salt and kerosene) affected them. Agricultural land-owning classes were not subjected to income-tax because they paid land revenue which was subject to periodic revision at fairly long intervals. In some States even land revenue was fixed (Permanent Settlement in Bengal and Orissa). The revenue payable was in any case based on an average computation of the value of the land and otherwise took no account of the value of the produce from year to year. The redistribution of wealth caused by the effects of war on world conditions has resulted in a much greater proportion of the national income finding its way into the pockets of both the labouring classes and the agricultural population. The latter class have been benefited by the rise in the prices of primary products which have risen proportionately more than the cost of living in rural areas. The effect on industrial labour has been less marked.

The rise in prices of primary needs (food, clothing and fuel) resulted in labour unrest but, by wage increases, industrial awards transferred a larger proportion of the purchasing power of the country to the hands of labour. Industrial labour, which now receives about four times the wages formerly earned, is still largely unaffected by taxation which falls mainly upon the salaried classes whose incomes are not adjusted in the same ratio. In the result the incidence of taxation has fallen disproportionately on the middle class urban population.

The need for development and social services has resulted in higher taxation much of which has not touched large sections of the population. The major portion of tax revenue is to be raised in indirect form from those who are taxed only indirectly. The revenue is to be expanded only by raising their consumption levels.

Agricultural incomes which have hitherto escaped should also be charged to income-tax equitably with incomes from other sources.

During and after the war, there was clear need to extract a substantial proportion of the inflationary potential; to that end the level of direct taxation was raised. A combination of high prices and high taxation has destroyed the ability to save; personal savings in middle-income groups have reached vanishing point. In upper-income groups constituting an infinite small percentage of the population, the super-tax limits are so high that their savings have also considerably declined. The limit of capacity has been reached.

Question 5.—The proportion of tax revenue to national income in India is considered small relatively to several other countries. Do you think this proportion can be raised, and, if so, what tax changes would you suggest for the purpose?

Revenue can only come from a surplus over subsistence. This surplus in India is much smaller than in other countries and therefore a comparison of the proportion of national income taken by taxation in India with that of other countries is invidious. The proportion of taxation to the national income can only be raised by increased production resulting in a higher *per capita* income.

Question 6.—Do you think that the relative place of direct and indirect taxes in the Indian tax system is satisfactory?

All direct taxation is contributed by only about 800,000 of income-tax assesseees, representing three in one thousand of the population. There will be a healthier ratio between the two when the number of persons contributing in direct form is increased as a consequence of raising living standards.

Question 7.—Do you consider that non-tax revenues are likely, in future, to occupy a more important place than hitherto in the public revenues of India? If so, please state the sources of non-tax revenue you have in view and indicate to what extent they may be expected to contribute to the public exchequer.

It is declared policy that State enterprise should, subject to the limitations of a mixed economy, operate in a wider field, and accordingly it is reasonable to suppose that if efficiently conducted and intended to produce revenue it will make a larger contribution which will however, be in part offset by a loss of revenue from the sphere of private enterprise where that has been intruded upon.

Question 8.—Do you agree with the view that receipts from particular taxes should not, as a rule, be funded or ear-marked for specific purposes?

The Chamber is generally opposed to an appropriation of tax receipts to expenditure for specific purposes since that may result in uneven and inequitable expenditure or its non-use.

Question 9.—Do you think that it is desirable, under certain conditions, to levy cesses for special purposes?

It is not desirable to levy cesses for special purposes. There are special cesses levied on sugarcane, tea, rubber and other commodities, the income from which is earmarked for specific purposes such as research and development. Very little has been spent for the specific purposes and substantial portions have been diverted to general revenues. A clear example can be found in the case of cess on sugarcane, which is collected by U. P., Bihar and Bombay. Collections under the U. P. and Bihar Cess of 3 annas per maund (15 per cent. of the cost of cane) amount to over Rs. 30 crores while the sums spent on cane development have been negligible. In 1948-49 the U. P. Government spent only Rs. 37 lakhs out of Rs. 3-17 crores collected while in 1949-50 the Bihar Government spent only Rs. 13 lakhs out of Rs. 70 lakhs collected.

It is still less desirable to levy a cess to subsidise another branch of the same industry, thus increasing the cost to the consumer.

Question 10.—State undertakings, commercial industrial, etc., are coming to play an increasingly important part in the economy of the country. Have you, from the point of view of their significance as a source of revenue, actual or potential, any comments or suggestions to make on matters such as the further extension of State undertakings and their policies in regard to pricing, in so far as these may be relevant to tax policy?

The relevance of State undertakings to tax policy can only be considered in the context of the economy contemplated by the Planning Commission, namely a mixed economy in which the public and the private sectors function side by side. It follows, therefore, that if there is to be a correct appreciation of the contribution which these undertakings are making or can make to the financial resources of the State, they should be taxed on the same basis as private enterprise and their accounts should be kept accordingly.

State undertakings must therefore function in all respects on the same terms and conditions and in the same 'milieu' as private undertakings. This is particularly important when, as in India, the spheres in which State undertakings operate do not cover the totality of a particular industrial field. Thus, whereas, for example, the State is engaged in a particular branch of the pharmaceutical industry, sharing the field with private enterprise, it is essential that the bases of computation of costs should be the same in order that comparable price policies may be followed. The same applies to State-owned collieries and power supply corporations which operate side by side with private enterprises of the same kind.

The operations of State undertakings must in all respects conform to normal commercial practice; they should be subjected to the same tax burdens as similar

units operating in the private sector; their accounts should be subjected to the same scrutiny by the Income-tax Department, and their balance-sheets should be available to the representatives of the proprietors (i.e., the Legislature) in the same way as are those of private enterprise. In any other condition the Legislature is prevented from exercising proper control and there is danger that uneconomic activities will be concealed by hidden subsidies.

Question 11.—Would you suggest that the net surplus earned by State undertakings should accrue to general revenues or be carried to a fund for financing projects of development or be re-invested in the undertakings concerned?

The State is entitled to receive only the net surplus available after meeting taxation and making such appropriations as would be considered necessary by a comparable unit operating in the private sector. The entire surplus should not be transferred to general revenue nor to a fund for financing other projects. No corporation operating in the private sector disburses its total earnings in the form of dividends. Such a policy would inevitably lead the undertaking into difficulties; there is no reason why a State undertaking should not set aside reserves against future contingencies and for development simply because the method by which its capital is raised (i.e., by a vote of the Legislature) is different from that to which a private enterprise must have resort. The funds of the enterprise should be employed only for its own development.

Question 12.—In examining the incidence of taxation on various classes of people, which of the following factors, singly or in combination, would you suggest as the basis of differentiation:—

- income
- occupation
- rural or urban residence?

Is there any other basis which may be considered?

Income levels alone should be the criterion in examining the possible incidence of taxation by Central and State Governments on various classes of people. In respect of taxation by municipalities or local boards, the criterion will normally be the services rendered.

Question 13.—Do you think that the burden of the present tax system Central, State and Local—is fairly distributed among—

- various classes of people?
- different States?

The burden of the present tax system, Central, State and Local, is not fairly distributed amongst various classes of people and between different States. In the case of Central taxation, the agricultural income is not brought within charge to income-tax which is imposed on non-agricultural income exceeding Rs. 4,200 and the privy purses of ex-rulers of Indian States are exempt. As a result of the existing burden of taxation coupled with the rise in the cost of living middle-income groups are left with relatively much less real income than the other two groups.

In the case of State and Local taxation there is a great disparity between different regions. Moreover, it must be pointed out that a State that collects higher taxes does not necessarily offer proportionately higher benefits to its people.

Question 14.—Have shifts in the distribution of income in the community in recent years altered the relative incidence of taxation on various classes of people? If so, to what extent?

The ground seems to have been covered in our replies in earlier questions.

Question 15.—Do you think that the cost of compliance with tax regulations adds materially to the burden of taxation? If so, in respect of what taxes? Please give details.

The tax laws are complicated and the personnel employed in their administration inadequate and frequently inefficient. The cost of compliance does add materially to the burden of taxation; for employment of considerable personnel is required, in effect reducing the surplus available for taxation and consequently increasing the tax burden.

The cost of compliance with Customs and import regulations is increased by reason of the lack of co-ordination between the classification of items under the Indian Customs Tariff and the Import Trade Control; much time is expended in resolving these differences. There is wide scope for simplification and clarification in this field.

The resolving of varying interpretations of the Sales Tax Act in different States puts an appreciable financial burden on those concerned and particularly on corporations resident in one State but trading all over India who are called upon to file statements and produce account books before various State authorities. Town

Duties and Octroi require an administrative expenditure which adds materially to the cost of production.

The cost of compliance with a complexity of tax regulations adds materially to the burden of taxation, particularly in regard to the maintenance of elaborate records and accounts to meet the requirements of :—

- (i) complicated and involved tax legislation ;
- (ii) varying regulations between different authorities in the methods of assessment ;
- (iii) the untrained personnel responsible for their administration.

Question 16.—Do the benefits accruing from public expenditure have a bearing on a consideration of the burden of taxation? If so, how would you take this into account in considering the burden of Indian taxation?

Where an increase capable of assessment accrues as a consequence of the expenditure, as in the case of irrigation, it would be appropriate to recover a part of the income through taxation.

Question 17.—Do you think that the tax burden weighs particularly heavily on any individual industry or occupation? If so, please furnish the Commission with the evidence on which you rely.

The tax burden falls particularly heavily on the professional class who are denied the benefits of incorporation and consequent capital development through profit retention, and whose provision for retirement and succession must be found from income taxed at high rates. Reference may be made to the Chamber's reply to Question 65 at Part II. Another example of disproportionate taxation is the trade in wines and spirits.

Question 18.—What role would you assign to taxation vis-à-vis various types of borrowing in finding the additional resources required for the development programme of the country?

Ideally where schemes of development are undertaken for lasting benefit not only for the present generation but also for coming generations some balance must be struck between the resources to be obtained through taxation and through borrowing so that the present generation bears only its appropriate share of the cost.

In present circumstances the Government's policy seems to be to obtain as much money as possible through taxation because of its anti-inflationary character and because the response from the capital market to the borrowing programmes of Central and State Governments has not been up to expectations. That is to say what is not given voluntarily by subscription to loans is taken through taxation. If the borrowing programme can be adopted to mobilising savings which to-day do not flow into the regular investment channels, then the present practice of obtaining funds through taxation for long-term projects could and should be modified.

Question 19.—In maximising the resources required for the financing of development, what degree of importance would you assign to :

- (a) economy and rationalisation in expenditure,
- (b) prevention of tax avoidance and tax evasion,
- (c) higher rates of existing taxes,
- (d) fresh taxes,
- (e) development of non-tax revenues?

The burden of taxation should not retard the processes of development and the administrative machinery must be competent to collect the taxes levied; the prevention of tax avoidance and evasion must occupy a place of first importance in measures for maximising the resources required for development. For, if evasion is resorted to on any wide scale the result must inevitably be that the taxing authority will seek to increase the burden of taxation still further in order to make up the shortfall. A snowball effect will result, so that in the end the burden of taxation will retard the processes of development.

In order that tax avoidance and evasion be reduced to a minimum, it is essential that the tax laws be simple, intelligible and precise; that those administering the laws treat assessee with sympathy and understanding and last, but by no means least, that assessment work be speedy and up to date. None of these conditions obtains to-day with the result that appreciable sums which should have reached the exchequer have not, and are not likely to do so. The need for a revitalising of the administration cannot be too heavily emphasised.

Once the taxable capacity has been determined and the tax collected, it follows that there should be strict economy and rationalisation in expenditure. The subject is entitled to the utmost care and economy in the expenditure of his contribution to the revenue.

Only when it is clear that the taxes at the existing rates are being effectively collected should any increase be considered, subject to the law of diminishing returns.

Fresh taxes should be resorted to only when all possible methods of broadening the coverage of the existing taxes have been explored or to take cognisance of shifts in the distribution of income in the community.

Question 20.—Under the Five-Year Plan the public sector is expected to undertake a larger investment; an important place is also assigned to the private sector in the development programme. How would you devise a tax policy suitable to the development programme of the country in both sectors?

Question 21.—What part can tax policy play in stimulating capital formation in the private sector consistently with the needs of the public sector?

There is a limited pool of available resources for which the public and the private sectors must compete. So long as the incentive to produce and to save is overborne by rates of taxation which are considered oppressive both sectors of the economy will finance schemes for development only with difficulty. The incentive must be increased by tax relief which will create savings exceeding the immediate loss of revenue. Reference may be made to the Chamber's submissions made at Part II.

Question 22.—(i) Is there evidence for the view that the rate of private capital formation in the community has been lower in the last few years as compared to the pre-war period? What factors, in your opinion, account for the decline?

(ii) Has there been a shift in recent years in the sources of capital formation in the private sector as between individuals, corporations, and other institutions?

In the absence of reliable data there is no evidence to show that the rate of private capital formation is lower than in the pre-war period although it is clear that there has been a substantial decline in the number of issues for public subscription made since 1946. The increase in the volume of industrial production would, however, appear to support the view that there has been a corresponding increase in capital formation in the private sector which may very well have been larger but for Government policies with particular reference to control and regulation, nationalisation, labour and imports. Government policies apart, the uncertain supply position and the high cost of capital equipment has been a deterrent factor, as also the partition of the sub-continent.

There has been a shift in net income distribution. Middle and upper-middle income groups have little or no savings whereas only institutional and corporation savings from profit retention are available for investment.

Question 23.—Do you think that tax relief in respect of persons in the middle-income group would assist the growth of savings or mainly promote consumption?

The middle-income group includes what were formerly known as the lower and upper-middle classes both of whom by tradition were accustomed to save. No saving is now possible either because of the high cost of living or of high taxation or a combination of both. In any event the incentive to save has been at least partly destroyed. At the bottom of the scale there is a psychological reluctance to save so little that it seems not worthwhile. At the other end the net return from the saving's investment is not adequate compensation for self-denial and the risk of capital. If there is a worthwhile saving and a reasonable net return from its investment there will be no substantial increase in consumption.

Question 24.—The Planning Commission have given an estimate of the rate of progress in regard to national income and consumption standards on the assumption of 50 per cent. of the additional output going into investment each year after 1956-57. What measures in the field of taxation are necessary if this assumption is to be realised?

A substantial part of the value of the additional output must necessarily be retained and go to increase the standard of living of persons who now make little or no contribution to revenue through either form of taxation. The remainder will accrue to persons and corporations whose increased contribution to revenue will automatically follow. Many in the first class may contribute through irrigation and betterment levies but it would not be unreasonable to increase or extend such indirect taxation as affects or will affect this class.

Question 25.—Do you accept the view that some regulation of consumption standards is desirable as a means of releasing larger resources for development? If so, what part, in your view, can tax policy play in this process and what should be the relative role of direct and indirect taxes in achieving the purpose?

While it is desirable that the largest possible proportion of resources should be available for development an increase in consumption may also be desirable where the standard of consumption may be judged to be too low. Impetus is thereby added to production. If denied the incentive to work may be impaired.

Question 26.—How far can tax policy help to promote the efficiency of the productive system? Do you think that multiplicity of taxes in India in respect of the same commodities and their lack of uniformity from State to State affect the allocation of resources in the community and hence the efficiency of the economy? Have you any suggestions for the rationalisation of the country's tax structure in these respects?

Any productive system is just as efficient as the tax policy will allow. Reference is frequently made at other parts of the Chamber's submission concerning the need for a reduction of the multiplicity of taxes and a uniformity of tax rates and their point of incidence throughout the Union.

Question 27.—How far in your view could the tax system be used to secure any order of priorities in the development programme in the private sector?

The question suggests a taxation differential for certain industries. Such a differential already exists through Sections 15C and 56A of the Income Tax Act. It is the Chamber's opinion that any increase in production is to be encouraged. There should be no differential.

Question 28.—What are the possibilities and limitations of tax policy as an instrument for economic development:—

- (a) by influencing over all demand,
- (b) by reducing consumption and unessential investment,
- (c) by positive inducements for desirable investment,
- (d) by redistribution of incomes.

The overall demand may be increased by a lowering of indirect taxation and consumption reduced by its being increased.

Unessential investment is best regulated through monetary controls so that only desirable investment is permitted and encouraged through a reduction in direct taxation, although the relief must extend also to existing industry. A tax policy operating as an instrument for economic development must necessarily tend to increase inequalities of income.

Question 29.—How would you assess the scope and efficacy of tax policy as compared to monetary policy and direct controls as an instrument of planned economic development in India?

A judicious blend of tax and monetary policies is the only means by which planned economic development can be promoted. Without savings, a monetary policy, with its concomitant controls, can produce nothing.

The instrument of direct controls should be used only to ensure equitable availability of essential commodities at times when the operation of the natural economic laws has been disrupted by extraordinary circumstances.

Question 30.—Do you think that the present tax system in India makes for a reduction in inequalities of income and wealth?

Question 31.—What modifications in the tax system would you suggest for securing a larger degree of economic equality, consistently with maintaining the incentives to capital formation and higher production?

Question 32.—What place would you assign to public expenditure as compared with the tax system in achieving a greater measure of equality of income?

The present tax system goes too far to reduce inequalities of income and wealth. Such is the way to economic suicide, for it reduces the industrious subject to the common level. In order to secure a larger degree of economic equality the overall living standard is to be raised through increased production in a condition in which there is incentive to work; the modifications necessary are discussed by the Chamber's submission in reply to Part II of the questionnaire.

Public expenditure may include the cost of social services, having the effect of raising the standard of living but not of equalizing incomes. In the Chamber's opinion there is no substitute for the tax system as the instrument by which a greater measure of equality of income is to be achieved.

Question 33.—Have you any changes to recommend in tax policy in relation to the investment of foreign capital in India?

It is prerequisite to the attraction of foreign capital that

(a) India should negotiate and conclude agreements for the avoidance of double taxation with the principal exporting countries;

(b) the status of the corporation tax is rendered less nebulous by its being credited as a payment of income tax made on behalf of the shareholder;

(c) the rate of tax suffered by foreign capital on profits, interest and royalties should be no greater than that imposed on Indian capital; the tax on dividends payable by Indian companies to foreign shareholder-corporations should be reduced by the allowance of the maximum corporation-tax abatements;

(d) section 23A of the Income Tax Act should not apply to a subsidiary or sub-subsidiary of a foreign company in which the public are substantially interested.

Question 34.—Article 269 of the Constitution enumerates the following taxes which may be levied and collected by the Union but the proceeds of which are to be assigned to the States;

- (a) duties in respect of succession to property other than agricultural land;
- (b) estate duty in respect of property other than agricultural land;
- (c) terminal taxes on goods or passengers carried by railway, sea or air;
- (d) taxes on railway fares and freights;
- (e) taxes other than stamp duties on transactions in stock exchange and future markets;
- (f) taxes on the sale or purchase of newspapers and on advertisements published therein.

How do you assess the possibilities of adding to the country's tax resources in respect of the above items?

Question 35.—Other possible ways of adding to tax receipts which have been suggested are taxes on capital, reintroduction of the salt duty, surcharges on land revenue, betterment levies, agricultural income-tax, social security taxes and modification of the policy of prohibition having regard to the directive principles of the Constitution. What are your views regarding the desirability and the probable scope of each of these forms of taxation?

Question 36.—Do you consider it desirable and feasible to levy a tax on unearned increments in value of land and other property as a result of public projects of development?

Question 37.—What measures would you suggest for increasing the receipts from existing sources of revenue?

Question 38.—What other new sources of taxation can you recommend?

The Estate Duty Act recently passed by Parliament clearly carries a potential for increased revenue. Reference may be made to the Chamber's submissions made in reply to other question concerning possibilities for additional revenues. The possibility of raising revenue through State lotteries was considered and rejected some years ago. The potential for increased revenue and the saving of the cost of enforcement upon resiling from or modifying the policy of prohibition adopted by a number of States is obvious.

Question 39.—To what extent and as regards what taxes should the powers of the Centre to impose surcharges under Article 271 of the Constitution be used?

The Centre should impose surcharges only as may be absolutely necessary, and then so that they are operative only until the next following 1st April.

Question 40.—What are the scope and limitations of tax policy as an instrument for dealing with inflationary or deflationary situations in Indian conditions?

In a country whose economy is highly developed tax policy can be used as an instrument for dealing with inflationary or deflationary situations. But in Indian conditions there are serious limitations to the use of direct and indirect taxes for their correction. During the past decade both direct and indirect taxes were used to counteract inflation. Direct taxation was raised to a maximum but there was considerable tax evasion. Direct taxation in any event affects only a fraction of the population, whereas inflationary pressure arises from all incomes.

Indirect taxation as, for example, the multipoint sales tax is very definitely inflationary. In a deflationary condition, however, a reduction in indirect taxation will reduce costs, thereby increasing consumption and stimulating exports. But it has been found by experience that fiscal considerations do not permit rapid adjustment in taxation, especially in deflationary conditions, when revenues from other sources are declining.

Question 41.—*In countering inflationary or deflationary conditions in the economy, what part would you assign to changes in the following :*

- (a) direct taxes,
- (b) indirect taxes—
 - (i) import duties,
 - (ii) export duties,
 - (iii) excise duties,
 - (iv) sales tax ?

Until the per capita income is higher and many more incomes can be brought within the compass of direct taxation, its raising or lowering can have little effect on inflationary or deflationary conditions.

Indirect taxation is a potential for the correction of inflation only when imposed at rates causing a diminution in returns. Any reduction in indirect taxation must tend to correct deflation.

Question 42.—*To what extent is it possible to increase the inherent capacity of the tax system to counter-act inflationary or deflationary conditions in the economy ?*

In a country where so many live so closely to the subsistence level the tax system has barely any potential for the control of inflation or deflation.

Question 43.—*What are your views in regard to the relative importance of public expenditure policies in moderating the forces of inflation and deflation in Indian conditions ?*

Public expenditure, whether in the sphere of development works or social services is too inflexible an instrument for the effective control of inflation. Neither can be readily abandoned or curtailed. On the other hand, expenditure on planned public works may be undertaken as a corrective to deflation.

Question 44.—*Apart from using tax policy to counter inflation or deflation in the economy as a whole, would you suggest tax changes for dealing with the effects of rising or falling prices on particular groups of tax payers or sectors of the economy ?*

Quite clearly the effects of rising or falling prices on particular groups of taxpayers may be offset by adjustment of the rates of direct taxation at the appropriate levels. Similarly the incidence of indirect taxation may be increased or reduced by an adjustment of the levies imposed on different sectors of the economy.

Question 45.—*How do you assess the present situation in regard to the strength of inflationary or deflationary influences and what adjustments, if any in taxation are indicated in the light of your views ?*

Much of the excess liquidity generated during the period of war and in the immediate post-war period has been removed. Present high prices, particularly of basic necessities of life like foodgrains, are the result of an increase in consumption and of recurring shortages ; as a consequence the cost of living remains at an unduly high level. The existence of inflationary pressures is not thereby necessarily proved ; there is a lack of balance between demand and supply of the necessities of life. Many economic processes show signs of slackening activity ; growing unemployment is a definite sign of the presence of deflationary influences. Owing to the high cost of living and the high incidence of taxation, both direct and indirect, personal incomes as well as corporate profits have been reduced. That will further accentuate the downward trend in the economy. Taxation reliefs will go some way to correcting the position.

PART II.—DIRECT TAXES

INCOME-TAX

Question 46.—*Do the provisions of the Income-tax Act (Sections 4A and 4B) regarding the determination of residence of various assesseees, viz., individual, Hindu undivided family, firm, association of persons and company, require any modification ? In particular, what is your view regarding the retention of the category described as "not ordinarily resident" ?*

Persons technically 'resident' or 'not resident' in the taxable territories may at the same time be 'not ordinarily resident'. Falling into this third category are those whose way of life does not mainly or normally lie in the taxable territories. Subject to certain exceptions they are free from charge to the tax in respect of foreign income. There seems to be no reason to abolish the category although a clarification of the language of its definition is desirable ; the freedom from charge is equitable enough and is not inconsistent with the position in other countries.

On the other hand the States are now merged in the taxable territories of India and there appear to be logical grounds for the proposition that the category may reasonably be extended to a company technically

resident only according to alternative (b) of the definition of residence of a company at section 4A (c). Income accruing or arising abroad not received in the taxable territories would be taken out of charge to the tax in the case of a company not wholly controlled and managed in the taxable territories but whose whole profits are now brought within charge by the artifice of the definition's alternative which is contrary to international usage and in effect gives the statute extra-territorial jurisdiction although under sanction of the law.

The employee of foreign enterprise, whose stay in the taxable territories extends beyond the limitation of the exemption period prescribed at section 4 (3) (xiv) but for less than 182 days in any year, in respect of the period by which his stay exceeds 90 days but is less than 182 days, or a person coming to India to take up employment in a trade or business in the taxable territories, in respect of a year in which he has not been in the taxable territories for 182 days, is to be taxed as a non-resident. In case he exercises the option provided for at section 17(1), he is to be charged to the tax on income accruing, arising or received in the taxable territories at the rate applicable to his total world income. A person may be not resident and at the same time not ordinarily resident but the benefit of the status of being not ordinarily resident is denied, by reason of the provisions of section 17(1), to the two types of persons described. That benefit is enjoyed by persons who have come to India for employment or business but whose stay has extended to 182 days but not to two years in all. There is not such a degree of difference in status between the class of person entitled to the exclusion from total income of income accruing or arising abroad and the class of person not so entitled ; it is thought specific provision may be made so that the person who has come to India for employment or business and not merely on a casual visit may also enjoy the benefit of the not ordinarily resident status for so long as he is in the taxable territories for less than two years.

Question 47.—*Does the definition of "income" (section 2 (6C)) require any modification ?*

Section 2 (6C) is not a definition of income nor is an exhaustive definition of the term possible. The section merely seeks to ascribe the character of income to certain incomes both real and notional not normally falling within its conception. What is or is not otherwise income must always be a question of law. Reference is made at other parts of this submission to the dividend inclusion in income and to the need to bring incomes from agriculture within charge to the tax. Subject thereto the definition requires no modification excepting only to include the notional income to be computed according to the prescription at the fourth proviso to section 10(2) (vii).

Question 48.—*Are there any receipts or gains which are not taxed at present but which, in your opinion, should be taxed and vice versa ? In particular, what is your view regarding the taxing of capital gains ?*

The context of 'income' at section 2 (6C) of the Act includes everything that is or may reasonably be deemed to be income.

Income is a proper subject of taxation ; the tax on income is generally accepted as the most equitable of all taxes. Only when all proper subjects of taxation are exhausted must the State resort to the taxation of improper subjects.

According to Mills, there is no tax which is not partly paid from what would otherwise have been saved ; no tax, the amount of which, if remitted, would be wholly employed in increased expenditure, and no part laid by as an addition to capital. All taxes, therefore, are in some sense partly paid out of capital ; and in a poor country it is impossible to impose any tax which will not impede the increase of the national wealth.

A tax on a capital gain is bad in a condition in which all of the ordinary kinds of income are taxed to the limit of the capacity of the subject leaving no margin for savings.

A capital gain of the kind taxed in the years 1947-48 and 1948-49 may in any event be purely illusory in the sense that it may be subsequently lost. If that happens and losses are to be carried forward only, not backwards, or no gain equal in its amount accrues within the period of limitation the tax is in effect a surcharge on the tax imposed on ordinary kinds of income.

Question 49.—*Have you any comments on the present position regarding taxation of profits, which accrue or arise abroad, on their repatriation to India ?*

The total income of a person resident in the taxable territories includes

- (a) income accruing or arising abroad during the previous year ;

- (b) income which accrued or arose aboard between 1st April, 1933 and the commencement of the previous year which is brought into or received in the taxable territories during the previous year;

subject to the exclusion of Rs. 4,500 having accrued or arisen but not remitted.

The Act has recently been amended so as to exclude from total income remittances made out of income which accrued or arose abroad between 1st April, 1938 and the commencement of the previous year

- (a) unconditionally in his 1951-52 and subsequent assessments in the case of a person who was not resident in two out of three years immediately preceding the previous year;

- (b) with conditions in the case of a person resident not entitled to the benefits of (a).

For so long as incomes accruing or arising abroad attract the tax on both bases (i.e., accrual and remittance) and the assessee cannot be certain that his identification of remittance with the corresponding income will be accepted by the revenue or indeed the income will not be twice taxed there is a psychological impediment in the way of the remittance of foreign profits whether ordinarily or under the provisions intended to encourage it. India could with advantage adopt the U. K. basis of charge if capital is to be attracted; the emphasis is appropriately on the word 'capital'. Only remittances should attract the tax and then only limited to the foreign income; remittances subsequently made from funds derived from an income source which has ceased should be treated as capital.

Question 50.—What change, if any, is called for in the definition of 'dividend' (section 2 (6A)); e.g., in relation to 'bonus shares'?

Sub-clauses (c) and (d) of the definition constitute a negation of the axiom that saving is a virtue and of the principle that whatever is saved has become capital; it may be observed that it was not thought fit in the United Kingdom to deny that principle following appeal court decisions against the revenue on question concerning the character of a distribution of assets in a winding-up. The tax is a tax on income; any attempt to expand the plain or judicial meaning of the word is an offence against the fundamental canon of income taxation. The subject is to yield to the State only the fruit of the tree, not the tree itself.

The corporation tax is in reality a super-tax on profits saved or retained which are accordingly twice taxed by the definition's artificial device. At the very least there should be a spread-over of the charge to the tax. The period of six years prescribed at the proviso to sub-clause (c) could be appropriately adopted for that purpose.

This Chamber is strongly opposed to any proposal to extend the definition to include what is commonly known as an issue of bonus shares. By their issue nothing is added to the wealth of the shareholder; on the contrary the intrinsic value of each unit in his original holding has, by the act of converting the saved or retained profits, been reduced. And in any event these profits have already virtually borne super-tax.

Question 51.—Do the provisions of the Income-tax Act relating to the taxability of non-residents through their business connections in India in respect of income deemed to accrue or arise within the taxable territories (Sections 42 and 43 of the Income-tax Act) affect adversely the interests of persons engaged in foreign trade? If so, what modification would you suggest in these sections?

The question is concerned only with the trading activities of a non-resident, not with any investment he may have made in India.

Under Section 42 (1) income, profits or gains accruing or arising, whether directly or indirectly, through or from any business connection in the taxable territories are to be deemed to be income accruing or arising within the taxable territories. The section enlarges the scope of the statute; by an artificial device it brings within charge to the tax income which, according to normal concepts, would otherwise not be taxable. In most other countries the income of a non-resident from business is taxed only if a trade is exercised within the country so that profits in fact accrue from the trade so exercised.

The third sub-section to section 42 is designed to exempt from charge to the tax so much of the profits of the non-resident as are attributable to the operations of the business (in respect of which there is held to be a connection in the taxable territories) not carried out in the taxable territories. In case goods are manufactured abroad for export to India, the sub-section goes some way to restore parity with the taxing laws of other countries but only some way.

Under English law if contracts which entitle the person making them to receive profits are habitually made in the United Kingdom by or on behalf of a non-resident, he is so exercising a trade in the United Kingdom, even though the fulfilment of the contracts takes place wholly or in part abroad. On the other hand, if the contracts are made abroad, the mere fact that they have been secured through canvassing done or that help has been given in the negotiation and execution of the contracts by an agent resident in the United Kingdom does not by itself constitute the exercise of a trade. The English courts find unacceptable the argument that a trade is exercised in the country in a case where the non-resident habitually employs agents to obtain orders and transmit them abroad for execution.

The words 'business connection' have been acceptably defined to mean a continuity of relationship in a profit-making association. It is thought that in case that continuity of relationship exists between a non-resident and a resident to whom has been ceded the sole right to purchase for re-sale in India at his own risk the goods of the non-resident, the selling organisation of the resident can be held to exist for the purpose of selling the goods of the non-resident. As a consequence the act of the resident who canvasses the re-sale of the goods for his own account and risk may be held to be an operation of the business in respect of which there is held to be a connection between resident and non-resident, so long as there is an exclusive arrangement between the two persons, the third sub-section may not altogether exempt the profits of the non-resident from charge to the tax although all other operations including the making of the contract, the giving of delivery of the goods and the receipt of payment are carried out elsewhere than in the taxable territories.

The mere maintenance of a purchasing agency or branch in England does not constitute the exercise of a trade. It has been held in India, on the other hand, that where there is a regular agency established in India for the purchase of the raw materials required for manufacture and sale abroad there is a business connection in India and a portion of the profits of the non-resident attributable to the purchase of raw materials in India by the agent will attract the tax.

The fiction of India's section 42 is out of accord with the laws of other countries. It creates an artificial or notional basis for charge to the tax not easily understood elsewhere. It is not possible, however, to generalise in reply to the question as to whether or not the interests of persons engaged in foreign trade are adversely affected.

In the import field smaller traders have lost foreign business connections who preferred to abandon the trade rather than submit to assessment in India. In the case of more substantial business, non-residents usually submit to the process of assessment although not without exception and not always without surprise and resentment. The conclusion that prices are increased against India to cover the tax not relieved by the exporting country is inescapable. In its application to imports section 42 may be thought to be justified by revenue considerations but it would seem doubtful whether the net accretion, taking account of the increased cost of imports, can be substantial.

So far as concerns exports the Department of Economic Affairs of U. N. O. reported in 1950 that exemption from certain taxes is in most countries the norm for goods sold for export and cites examples of exemptions from taxes on manufacture, turnover, sales, luxuries and excise.

It cannot be assumed that the levy of income-tax, actual or potential, on a proportion of the foreign customer's profits operates so as to cause him to buy elsewhere or to reduce the price he is able or willing to pay. Much depends on other duties the traffic may have to bear and on alternative profit possibilities. There is no certainty that exemption from the tax would stimulate exports.

The objectionable feature of this particular legislation is the responsibility for payment of the tax put upon the person held as an agent under section 43. Only in exceptional cases is he able to recover the tax paid out of assets of the non-resident under the protection of the indemnity provided to him at section 65. His situation is frequently made the worse because the non-resident refuses to co-operate in securing a proper assessment and the agent is not able to bring the evidence necessary under section 2(6) for the grant of a declaration that the non-resident is a company. In the result, the total world income of the non-resident and his profit margin are estimated; the assessment is made at the rates applicable to an association of persons. In such cases the Department is not sympathetic and the estimates of total world income and of profit margin are not conservatively made. Interest chargeable under section 18A(8) is added although the person treated as an agent under section 43 may have had no warning

of his impending responsibility at 15th March of the previous year and he is in any event in no position to file an estimate of the non-resident's profits for compliance with section 18A(3).

In such cases there is real hardship and adversity to the persons engaged in foreign trade to the extent that the carrying on of their business is attended by constant apprehension. There are no means by which the business may be arranged so as to keep the non-resident entirely out of charge to the tax. If the provisions of sections 42 and 43 are invoked will the non-resident co-operate in discharging his liability under what he regards as an unusual and unjust tax law?

The revenue would undoubtedly suffer if the Indian trader were relieved of his responsibility for payment of the tax. Any sanction imposed, in the alternative, upon the traffic between the resident and non-resident would be still more unpopular and would not perhaps be practicable upon a relaxation of existing controls.

Under English law, not only must the trade be exercised in that country; there must also be a person chargeable to the tax. The parties are able to arrange the course of conduct of the business, e.g., as between principals, so as to keep the non-resident out of the charge. As may be seen from the case law on the subject, however, not all of England's foreign trade avoids the tax. Nor would all of India's foreign trade if the English law were adopted. That appears to be the only possible remedy.

The second sub-section of section 42 requires no amendment. The substance of that sub-section is embodied at section 37 of the English Act of 1951.

In the alternative to adopting the U. K. law, sections 42 and 43 may be amended so as to define a business connection in the language of the United Nation's Model Convention for the Avoidance of Double Taxation according to which a non-resident person shall not be deemed to have a business connection in the taxable territories unless he maintains therein a branch, management, factory, or other fixed place of business. An agent in the taxable territories for a non-resident person shall not be deemed to be a business connection unless he has and habitually exercises a general authority to negotiate and conclude contracts on behalf of the non-resident of keeps a stock of merchandise from which he regularly fills orders on his behalf. A non-resident person shall not be deemed to have a business connection in the taxable territories merely because he conducts business dealings through a *bona-fide* broker or general commission agent acting in the ordinary course of this business as such. A fixed place of business or an agency maintained by a non-resident person solely for the purchase of goods within and conversion or sale without the taxable territories shall not be deemed to be a business connection.

Question 52.—What modification would you suggest in the definition of "agricultural income" (section 2 (1) to avoid the contingency of the same income being taxed by the Central Government as well as the State Governments, e.g., in respect of income from forests, dividends from agricultural companies, etc.?

It is the opinion of this Chamber that the scope of the Income-tax Act should be extended to incomes from agriculture and the requisite amendment of the Constitution and of the Act be undertaken accordingly. That being so, the Chamber submits no other reply to this question.

Question 53.—Are you in favour of integrating agricultural income with non-agricultural income for rate purposes? If so, which of the following methods would you advocate:

- (i) Aggregation of agricultural and non-agricultural incomes only under the State Acts;
- (ii) Aggregation of agricultural and non-agricultural incomes only under the Central Act;
- (iii) Aggregation of agricultural and non-agricultural incomes both under the State and the Central Acts?

Please discuss the administrative, constitutional and other problems that are likely to arise if any of the above alternatives is adopted.

The question of integration for rate purposes arises only so long as agricultural incomes as defined at section 2(1) continues to be exempt from the tax. In the alternative to extension of the scope of the Act so as to bring agricultural income within its charge, no variant of the methods of aggregation postulated is logical. Any one of them must otherwise result in the virtual imposition of an additional tax on the agricultural income of the subject who has non-agricultural income also and must accordingly operate to the advantage of the subject whose only income is from agricul-

ture. In the opinion of this Chamber nothing short of extension of the scope of the Act to incomes from agriculture can result in an equitable distribution of the tax burden.

Question 54.—Would you recommend the abolition, by a suitable amendment of the Constitution, of the distinction between agricultural and non-agricultural incomes and the taxation of both types of income, aggregately under a Central Act.

The Todhunter Committee of 1924-25 closely examined this question and concluded that there was no historical or theoretical justification for the continued exemption from the income-tax of incomes derived from agriculture. There were, however, administrative and political objections to change at that time. Dr. R. P. Paranjpye by his separate minute expressed the view that it was not possible to delay indefinitely the consideration of the vested interests created by the permanent settlement of Bengal and the consequent exemption of considerable incomes from taxation. The Hon'ble Sardar Jogendra Singh was of opinion that, if the burden (of taxation) were to be equally distributed the land tax must come under the Income-tax Act. The fusion would take time.

The administrative difficulties referred to by the Todhunter Committee are not 28 years later apparently of such significance as to deter certain States from the exercise of their rights under the Constitution. Nor apparently has it been found that the political objections are insuperable and it may be observed, in passing, that the constitutional right has been exercised in parts of India where objection to it was likely to be most vocal.

A tax offends against the canon of equality if its burden is not shared by all in proportion to the income enjoyed by each under the protection of the State. A tax on income should be a tax on every income. This Chamber accordingly recommends the abolition of the distinction between agricultural and non-agricultural incomes and the taxation of both types of income aggregately under the act.

Question 55.—Is the treatment given to irregular and fluctuating income in the present law satisfactory? In particular, should any changes be introduced—

- (i) to average income over a number of years where receipts are irregular and fluctuating;
- (ii) to spread lump sum receipts over a number of years?

The special provisions recently made for royalties or copyright fees go as far as meantime appears necessary for the relief of income of the kind.

By a recent amendment of the Act death-cum-retirement gratuities paid by Central Government or a State Government are entirely exempted from charge to the tax. It is thought that is not a new exemption but the amendment merely gives statutory effect to an exemption always enjoyed by certain civil servants sanctioned only by undisclosed convention. Gratuities paid to the employees of private enterprise attract the tax as they should; their exemption also not correct the position. It is, however, suggested that the spread-over relief for such gratuities usually granted under section 60(2) should likewise be given statutory effect and they be taxed by the inclusion in total income over a period of eight years by equal instalments.

Question 56.—Do you think the present provisions regarding exemption of charitable and religious trusts need any modifications?

The Chamber makes no reply to this question.

Question 57.—(i) Should the business profits of co-operative enterprises, which are now exempt, be charged to income-tax and super-tax? If so, should co-operative societies be treated as companies or should a lighter levy be imposed? In case the exemption is continued, should it be restricted to certain categories of co-operative enterprises?

(ii) Do you agree with the view that the income derived by co-operative housing societies by way of rent should not be treated as income from property assessable to income-tax? Would you, in this respect, differentiate between tenant co-partnership housing societies and other types of housing societies?

(iii) It has been suggested that there are divergent decisions by different income-tax authorities in respect of assessment of income of co-operative societies from sources other than business. If this is so, please indicate such decisions and the measures you would suggest to secure uniformity in assessment.

No consideration of the advantages accruing from the institution of co-operative principles or of the admitted merits of co-operative societies is necessary nor indeed does the question require such a consideration. The

Central Government and at least the Bombay and Madras State Governments have legislation in force designed to facilitate the formation of co-operative societies. These co-operative societies are intended to promote thrift and self-help among agriculturists, artisans and persons of limited means with common economic needs and so to create better living, better business and better methods of production. It must, presumably, be left to the Executive to see that proper use is made of the various co-operative Societies Acts. In Bombay, for example it is pre-requisite to registration of a co-operative society that it is formed for the object of promoting the economic interests of its members in accordance with its co-operative principles. The expression "co-operative principles" is not defined; it is the duty of the Registrar to be satisfied that the pre-requisite is present.

Co-operation as represented by the co-operative society differs basically from capitalism as represented by the joint stock company inasmuch as while co-operation recognises that capital is entitled to a fair interest it refuses to admit any other right attaching to its possession, more particularly a claim to a controlling voice in the enterprise. It is essentially a type of organisation for those with common economic needs and it may well be said that (again assuming there is proper executive control over the formation of and administration and membership of co-operative societies) it would defeat the very objects of co-operation to levy taxes upon the societies. On the other hand, it can be argued that there is no need and that it is not desirable to give co-operative enterprises as full an exemption as they now enjoy.

By a Notification issued in 1925, the profits of any co-operative society, other than the Sanikatta Salt Owners Society in the Bombay Presidency, for the time being registered under the Co-operative Societies Act 1912, The Bombay Co-operative Societies Act, 1925 or The Madras Co-operative Societies Act, 1932, or the dividends or other payments received by a member of any such society out of such profits are exempt from both income-tax and Super-tax but are to be included in the total income of the member. By an explanation to the Notification it is provided that the exemption does not extend to (a) income from securities taxable under Section 8, (b) income from property taxable under Section 9, (c) dividends or (d) income taxable under Section 12 as income from other sources.

The Present principles of income-tax made applicable to mutual concerns would apply to co-operative societies (even if no specific exemption were given) and a co-operative society would be exempt from tax on its so called profits in proper circumstances. Trading profits would not, however, be exempt.

The exemption given by Government to dividends or other payments received by a member of any such society out of its profits does not appear truly to derive from the principles of co-operation and might be withdrawn but presumably the loss of revenue, having regard to the income of the type of person concerned, is extremely small.

There is no reason why business profits of co-operative enterprises should continue to be exempt from income-tax and super-tax except in so far as they would in any event be exempt having regard to the principles applicable to mutual associations. As regards the rate of tax, they should be treated on the same footing as companies, because, having regard to the source, there is no reason for any distinction. In case the exemption is continued it should be restricted to categories of co-operative enterprises which are quite clearly associations of poor persons formed for their common economic good.

There is no reason why there should be any exemption from charge to the tax under section 9 of the Act in the case of co-operative housing societies. There is no exemption now and, while it may be an excellent thing that persons who are perhaps unable to build individual dwelling places should associate themselves for the purposes of building and maintaining dwelling houses more economically, there is no reason why they should not pay income-tax on the annual value of such property in the normal way. There is no ground for any differentiation between tenant co-partnership, housing societies and other types.

It is not known what are the divergent decisions in respect of the assessment of the income of co-operative societies from sources other than business referred to but, even with the present exemption, the question of applying the general principles governing mutual concerns to co-operative societies still arises in the case of co-operative societies registered abroad, or for the purposes of deciding whether the surplus accruing to a co-operative society is to be included in its total income to determine the rate of tax applicable to its total income; in the case of *The English & Scottish Joint Co-operative Wholesale Society Ltd. Vs. The Commissioner of Income-tax, Assam*, the Privy Council laid down certain prin-

ciples applicable to the taxation of mutual concerns which definitely differ from propositions previously laid down by certain Indian High Courts, e.g. *The English & Scottish Joint Co-operative Wholesale Society Ltd. Vs. Madras Income-tax Commissioner* (3 I. T. C. page 385).

Question 58.—Are you in favour of continuing the concessions given to new industrial undertakings under section 15C of the Income-tax Act? Have initial and extra depreciation allowances made the concessions practically infructuous? If so, what are the directions in which the provisions of this section should be modified?

These criticisms lie against section 15C and these remedies suggested:—

- if it is designed to increase production the concession should extend to existing undertakings as does section 56A; that may be done at little cost to the revenue since new production will usually be subsidised by old; the difficulty of application is not insuperable;
- the concession may be rendered infructuous by the initial and additional depreciation allowances which are not in themselves a concession but they are virtually interest-free loans; the undertaking should have the option to postpone the claim to these allowances at least until the expiration of the five year period; in the alternative the grant of the concession may run from the year in which assessable income first appears;
- the revenue is committed to the principle that the exemptions in each year should extend in the aggregate to 30 per cent. of the capital; there is no certainty of benefit within the five year period whether that runs from the commencement of manufacture or from the beginning of the year in which an assessable income first appears and so the limitation may be removed, restricting the concession to 6 per cent. in each year subject to a maximum of 30 per cent.

Question 59.—A suggestion has been made that banking profits of foreign branches of Indian banks should be given concessional treatment for tax purposes in order to encourage the opening of branches abroad. What are your views?

All business not only that of banking, should be encouraged to extend the scope of its operations to foreign countries. A special case may be made for banking on the grounds that it cannot easily compete with institutions already established abroad but the same may be said of insurance or, indeed, any other business. Exports of goods and services would be stimulated if the foreign profits of business resident in the taxable territories were taxed at lower rates but the concession must necessarily apply only to profits brought in. The possibilities of a shift of capital and a diversion of profits are obvious. Checks would necessarily be employed.

Question 60.—Should any liberalisation be made in the present limits of exemption from tax of life insurance premia and contributions to provident funds?

Although the general price level and consequently wages have multiplied in the meantime the exemption limit has in the individual case remained static at one-sixth of total income subject to a maximum of Rs. 6,000 since 1939. The value of the abatement, which is for income-tax only, was actually reduced in 1950 when there was a reduction in income-tax rates, slightly offset in 1951 and subsequent years when the 5 per cent. surcharge was imposed; and it may be noted that earners in the upper-income brackets were doubly penalised in 1950 when the revenue loss of income-tax was recouped by a corresponding increase in the super-tax rate.

All of the arguments favouring a substantial increase in the abatement are so widely known as not to require repetition. Attention is, however, directed to the findings of the recent U. K. inquiry into the quantum and effect of the investment of insurance companies' funds. Insurance companies are the largest investors in Government loans and in addition invest a substantial part of their funds in private enterprise which they do not seek to control. The State enjoins on the subject the need to save but Pellon in the shape of higher rates of taxation coupled with reduced reliefs is piled on the Ossa of higher living costs; there is no margin for saving and indeed the incentive to work and to save is destroyed. There is no better form of saving than that which is canalised to State loans and private enterprise through insurance companies and provident funds; that, once embarked upon, it acquires an element of compulsion makes it better still. This is a wrong to be righted as quickly as possible. There must be a substantial degree of liberalisation.

Question 61.—(i) Do you favour the grant of larger depreciation allowances to assist industry to finance the considerably increased costs of replacement of assets? If so, how and in what form should they be given—

- (a) by larger depreciation allowances on new assets;
- (b) by revalorisation of existing assets;
- (c) by treating the excess of replacement cost over original cost as revenue expenditure;
- (d) by any other method?

(ii) What is the justification for assistance from public resources to certain classes of tax-payers only by way of covering partially the excess of replacement cost over original cost of old assets?

(iii) In case adequate justification exists for assistance by Government in the form of tax concessions to meet the situation, what safeguards should be prescribed to see that the funds so made available are utilised for the purposes for which they are intended.

Although most of the damage caused by inflation has been done and cannot easily be undone, there is still a strong case for increased depreciation allowances.

The cost of buildings, plant and machinery during the eight or nine years preceding 1939 were relatively stable. During the war costs increased steadily but there were price controls and in any case new buildings, plant and machinery were not readily acquired. After 1945 costs increased very steeply until well into 1952. A pre-1939 cost index of 100 increased in 1945 to 175 and in 1953 to over 300. In the result, industry which has depreciated fixed assets on the basis of pre-war cost and based the prices of its products accordingly, has dissipated assets and lost capital.

Prudent industry has included in costings a depreciation charge based on the replacement cost of assets and has built up depreciation reserves. That, however, is not sufficient; a further provision must be made to cover the excess of the cost of replacement over original cost so that, in addition to a depreciation provision equal to the full book value of the assets, there is a further reserve for replacement.

That procedure, provided profits permit, would set aside the finance necessary for replacement in due course if it were not that taxation confiscates about half the provision made in excess of the standard income-tax wear and tear allowances which are based rigidly on original cost and diminish progressively being calculated on written-down values. In that condition, in order to provide fully for the replacement at present day prices of an asset purchased in 1939, industry must reserve or write off six times the normal depreciation. One half is taken by tax leaving as net provision three times the original cost to cover the inflation factor and provide a reserve for future replacement. Not all industry is in a position to provide out of profits depreciation and fixed assets replacement reserves at six times original cost; as a result capital has been dissipated over the years since 1939.

Most of the damage has been done and it would not now be financially possible, even if the principle were accepted, for the revenue to make good the excess tax collected. The finance necessary for replacement has to be found from other sources (additional capital from share-holders or the public or bank borrowing) in cases where adequate reserves have not been made in the past. The position could even now be remedied to an extent if there were depreciation allowances based on the replacement cost of assets. That would best be done by means of a revaluation but the difficulties of such a procedure, coupled with the possibilities of dishonest practices, would make detailed revaluations impracticable. In any case, the records of many concerns would not provide sufficient data. It should, however, be possible to base a relatively simple formula on the assessment record. Thus:—

- (1) the value of assets purchased up to 31st December 1940, as shown by the income-tax returns, should be trebled;
- (2) the value of assets purchased between 1940 and 1945 should be doubled;
- (3) the value of assets purchased between 1946 and 1949 should be increased by 50 per cent.

From the aggregate so ascertained should be deducted the total depreciation allowed in taxation assessments to date and a revised written-down value derived, on which to allow future depreciation.

In the alternative the existing written-down values could be increased by the same factors instead of applying them to original cost.

Any allowance by itself, in whatever form, does not entirely meet the case. Capital has already been dissipated by a combination of inflation and confiscatory tax. The problem now is to find the finance for the replacement of assets. Initial allowances, although in

effect only interest-free loans, taken in conjunction with a revaluation on the lines indicated would be a great help. The finance must be found. But that would derive from the reliefs arising out of the initial allowances following the replacement of the assets. To this end, the initial allowances should be as high as revenue can afford. Even an initial allowance of 100 per cent. (i.e., treating the replacement costs as revenue expenditure) would not be out of the way considering the present difficulties of certain industries.

The treatment as revenue expenditure of the excess of replacement over original cost would probably be impracticable; in view of technical developments it is very unlikely that an asset purchased 20 years ago would be replaced by an exactly similar asset.

The justification for assistance from public resources lies in the damage that has been done to the industrial structure by the combination of inflation and taxation of profits necessarily reserved. Plant wears out and has to be replaced; even buildings in time have to be replaced, although admittedly there is less justification for particular consideration in the case of buildings. Other classes of taxpayers are not in the same case at all. Even though there may have been a time lag, the effects of inflation in the case of other taxpayers have been off-set by larger emoluments.

Any form of concession introduced may be conditioned by requiring its investment or deposit with a scheduled bank pending its reinvestment for the purpose for which it is intended.

Question 62.—Are any changes called for in the classification of assets for purposes of depreciation, rates of depreciation and methods of computing the allowances?

No change appears to be called for in the classification of assets for the purposes of the allowance for depreciation. It is the general consensus of opinion that the rates are too low for application to the written-down value. Slightly lower rates applied to original cost would be preferred. The objection to the basis of original cost on account of the difficulty of annual identification of the asset is not entirely valid. When the asset is sold or scrapped the year of its being brought into use is to be determined for the purpose of computing the balancing charge. Attention is however directed to the difficulties of the electricity supply industry by reason of the different statutory rates of depreciation prescribed under the Income-Tax Act and under the Electricity (Supply) Act, 1948.

Question 63.—Should any tax concessions be given to encourage development of mineral resources? If so, what form should they take? In particular, should depletion allowance on wasting assets be allowed? How should it be computed for different kinds of assets you have in view?

The Acts provisions relating to the taxation of income from mining are in accord with the principle that the cost of raw material for conversion by a manufacturing process is a revenue expenditure but the cost of the mining site or the right to mine is an expenditure of capital just as much as the cost of machinery or buildings.

The provisions of section 56A may reasonably be extended to any enterprise engaged in the development of mineral resources. In addition there should be provision for allowance of the amortization of the cost of mining rights and other expenditure of a capital or quasi-capital nature not entitled to any allowance for depreciation.

Question 64.—In what form would you provide for personal and family allowances—

- (i) exempting the first slice of income from tax; or
- (ii) providing specific allowances for family and dependents? In the case of (i), do you consider that the first slice—Rs. 1-1,500—should be revised? In the case of (ii), what treatment would you give to the Hindu undivided family?

The present individual exemption limit of Rs. 4,200 is excessive, judged only by India's general standard of living. Judged otherwise, as by political considerations or difficulties of assessment and collection, it may be expedient. However that may be the need for personal and family allowances is adequately taken care of by the absence of charge on the first Rs. 1,500 and by the imposition of less than the standard rate of tax on incomes not exceeding Rs. 15,000 in a country where marriage is almost universal and large families the rule rather than the exception.

Question 65.—Should the present law regarding admissible expenses (section 10(2)) be altered? If so, please indicate, with reasons, the items of expenses

- (i) which are not now admissible but, in your view, should be admissible and
- (ii) which are now admissible but, in your view, should not be admissible.

The expenses to be admitted in computing the profits of a business, profession or vocation are specified at clauses (i) to (xv) of the second sub-section. After providing for certain expenses which by their special character require separate specification, general provision is made for any expenditure (not being in the nature of capital expenditure or personal expenses of the assessee) laid out or expended wholly and exclusively for the purpose of the business, profession or vocation. It has not been found necessary, practicable or expedient to attempt a specification of all the kinds of expenditure to be allowed and indeed, if that were attempted, there would be no end to discovering that something had been omitted.

In general, there are two kinds of expenditure, capital and revenue. Capital expenditure is to be disallowed but, whereas the section provides for the annual allowance of the loss in the value of buildings, plant, machinery or furniture by depreciation and all expenditure truly of a revenue character is to be allowed there is another kind of expenditure for which, by reason of its quasi-capital character, there is no allowance either upon its being laid out or over the period of years to which the expenditure may be related. There is an exception to that general rule. Specific provision is made for the allowance of expenditure incurred on research even if that expenditure is of a capital nature.

The post-war establishment and development of a number of industrial units has been made possible by association with industry in other countries. The foreign industrial unit has been established for many years and is possessed of all of the technical knowledge which the industrial unit in India is to acquire, alternative to its ready-made purchase, only by much expenditure on research and costly experiment or by the employment of foreign technicians. A number of such units have accordingly contracted with foreign industry for the grant of a licence to manufacture and the provision of technical assistance. The consideration paid for that licence and that assistance is described by the revenue as an expenditure for enduring benefit, a description having no legal sanction. In the event, the expenditure is disallowed although so much as was estimated to be attributable to the cost of the continuing technical assistance has been allowed in appeal in one case and the department has not contested the decision of the appellate authority.

The licence to manufacture is granted for a limited period of years, which may be as short as five, after which it may be revoked. Its cost is just as much an expenditure laid out or expended wholly and exclusively for the purpose of the business as is the cost of research. At the least it is entitled to the same treatment. Because of its quasi-capital character, being a fixed sum paid in cash or by a free allotment of shares, its allowance is inadmissible under clause (xv) of section 10(2). The Legislature have thought fit to make specific provision for the allowance of expenditure of a capital nature on scientific research; the like provision should be made for the cost of a licence to manufacture with which is combined technical assistance related, however, to the term of the contract under which it is paid.

There are other kinds of expenditure of a quasi-capital nature for which specific provision should be made including the cost of mining rights to which reference is elsewhere made and a premium paid for the lease of land or of buildings.

In a reference made under section 66, the High Court may make an order as to costs. The Income-Tax Appellate Tribunal has no such discretion nor has the Appellate Assistant Commissioner. On the other hand the costs incurred by the assessee in taking an appeal are not admissible as an expenditure. The revenue point of view that the Department bears its own costs is irrelevant; the tax-payer provides the revenue and so in effect bears the costs on both sides. Provision should be made for the allowance of the assessee's costs in the same ratio as his success in appeal.

In a state of inflation and increased taxation there is little or no individual saving. As consequence the practice of rewarding the services of executives by the provision of a retirement benefit has become almost universal. The executive may be a member of his corporation-employer in which case the retirement benefit serves to augment savings made through profit retention. The cost is an admissible deduction from profits for the purpose of income-tax assessment usually under the sanction of section 58R. In case the whole cost is borne by the employer, there is no conflict with the provisions of section 15 by which the exemption of provident fund contributions and life insurance premiums is restricted.

Individuals or partners in firms who are members of professional bodies engaged in the practice of a profession are denied the advantages of incorporation and of saving through profit retention. They suffer the double disability that, not being employees, as are the executives of a corporation, the cost of provision of a retirement benefit is not an admissible deduction in

income-tax assessment. Nor can they realise the value of goodwill acquired by purchase or created by hard work since high prices and high taxation leave no savings in the hands of their successors to pay for it. In the result persons with professional qualifications now prefer employment in business or industry; in the next generation only those temperamentally unsuited to business or industry or who have inherited means or for whom the work is a vocation rather than a profession will be found in the practice of the professions. That is already the position in England and in the U. S. A.

Any logical basis for the distinction no longer exists in a condition in which the professional man's remuneration, after deducting his expenses and taxation, is only a living wage; but the distinction subsists only because he is a casual worker not in the service of any one employer. That is no warrant for its continuing. Provision should be made in the assessment of incomes from the professional for the deduction of the cost of providing retirement benefits. The savings in a private company through profit retention may extend to some 22½ per cent. of income. The allowance for which provision should be made may extend to one-third of the income so as to include also the cost of contributions to an approved superannuation scheme.

The section calls for no amendment so far as concerns expenses which should not be allowed.

Question 66.—(a) Are you in favour of combining income-tax and super-tax into a consolidated levy?

(b) What are the merits or demerits of such a step from the point of view of (i) assessee (ii) administration?

(c) Are you satisfied with the degree of progression in the present rate structure (both income-tax and super-tax) especially in regard to its economic effects?

(d) In case you consider a change is necessary, what alternative rate structure would you recommend?

(e) Should the rate of surcharge levied under Article 271 of the constitution also be graduated?

The questionnaire has elsewhere invariably referred to the super-tax on companies as the corporation tax. It is assumed that this reference is made to the super-tax on personal incomes only since also the corporation tax is not shared with the States and accordingly must continue to be a separate levy.

There appears to be no great objection to a consolidation of the two taxes and in fact their combination is desirable if those reliefs presently granted in respect of the income-tax only were then to abate the consolidated tax. The consolidation would in a number of ways reduce clerical work in the administration without reducing essential statistical data.

The degree of progression in the super-tax scale is too steep. At the lower end of the scale no savings are left to a large class accustomed to save and to invest in government loans and industry. At the other end, the microscopic net return does not warrant putting the capital at risk. At the same time the super-tax exemption limit may be too high in a poor country. Those in the range of Rs. 20,000 to Rs. 25,000 receive the full benefit of the allowance for earned income and are perhaps in a relative sense least taxed as a consequence.

No criticism lies against the degree of progression in income-tax rates which, combined with the exemption limit, takes care of those factors for which no specific allowance is made. If, however, the expenditure of the State is to be financed not entirely by taxation but also through savings and if conditions in which industry may look to public subscription to provide funds for its expansion are to be re-created, there must be a less rapid progression in the super-tax incidence. In the suggested scale the first Rs. 20,000 would be exempt, the next Rs. 5,000 would bear half an anna, the next Rs. 5,000 one anna, the next Rs. 10,000 one and a half annas, the next Rs. 10,000 two annas; each subsequent Rs. 10,000 up to Rs. 1,00,000 would arise by one anna to seven annas and the balance charged at eight annas.

It is hoped the surcharge is not a permanent institution. It need not be graduated but its incidence should be equal in the same proportion as the tax.

Question 67.—Have you any change to suggest in the exemption limit for individuals (Rs. 4,200) and for Hindu undivided families (Rs. 8,400)?

The present exemption limits are generous if not, indeed excessive. While it is desirable that every subject should contribute according to his means and so made conscious of his responsibility to the State (an end to be achieved by a lowering of the limit combined with levy of a reduced rate of tax on the income brought within charge), that may be inexpedient by reason of the difficulty of assessment and collection.

Question 68.—(a) Are you in favour of a distinction being made between earned and unearned incomes? What is the economic justification for such a distinction?

(b) Is the present definition of "earned income" in section 2(6AA) of the Income-tax Act adequate in this respect or would you suggest any modification?

(c) Should the quantum of relief now afforded be extended or reduced? If so, to what extent?

This Chamber approves the distinction between earned and unearned incomes, economically justified since it is an incentive to work which is the basis of all productivity and it affords a measure of recognition of the principle that there must be an allowance for the depreciation of the capital assets of the earner, i.e., his physical and mental capacity to work as well as for expenses of a personal character including transport, for which there is no other allowance. If the need for a distinction is admitted it must logically extend throughout the entire range of incomes and abate the super-tax also; otherwise it is not what it purports to be but is merely a relief given to smaller incomes. It is observed in passing that the earned income allowance has now been increased in the U. K.

The definition of earned income at section 2(6AA) is considered adequate.

Question 69.—Have you any changes to suggest regarding the principles followed in valuing stocks of a business for assessment purposes?

The stocks of a business are to be valued for assessment purposes at either cost or market value whichever is the lower. Subsidiary thereto the principle may be applied unit-wise in the preparation of the stock inventory. It is thought that if profits are to be correctly determined the same mode of valuation must be employed at the end of each accounting period and accordingly there is no sanction for any variation in practice in making a determination of what is cost. There are three variants of that practice:

- (a) the average cost of accounting period may be taken;
- (b) it may be assumed that the materials or articles remaining in stock are those most recently purchased; or
- (c) it may be assumed that the materials or articles remaining in stock are those purchased at the outset of the accounting period.

Prices are now relatively stable; a consideration of the question is perhaps now of more academic than real significance. It was not, however, academic in the period of inflation which set in in 1938. Prices gradually increased until 1945 and increased thereafter with greater impetus, aggravated by the outbreak of war in Korea. If, however, there is now to be a recession in prices as a consequence of more settled world political conditions the question may again become of very real concern to all business.

If, when prices are rising, the stock inventory is not valued according to the principle that the materials or articles most recently purchased are deemed to have been first consumed or sold the profit & loss account will not, it is thought, disclose the true profit of the business. The converse applies equally when prices are falling.

If the original capital is to remain intact the profit inclusion in the selling price must be doubled to take care of the false profit factor; the inflationary condition is accordingly given added impetus. Reserves may admittedly be made although without allowance of any income-tax deduction but, the higher the tax, the greater the difficulty of preserving the capital intact.

It is thought that the principle of valuing stocks at cost or market value whichever is the lower should equitably be rendered less inflexible so as to permit a valuation by reference either to average cost or the cost of materials or articles most recently purchased or the cost of materials or articles earlier purchased, giving the assessee the option in each year to employ any of these variants.

Question 70.—Do you consider that any change is called for in the method of assessment of the Hindu undivided family? If so, in what respects?

The Chamber makes no reply to this question.

Question 71.—Should exemption from income-tax be allowed in respect of voluntary surrender by managing agents of the whole or a part of managing agency commission? What safeguards should be laid down against misuse of such a provision?

The question is so phrased as to suggest that the commission of a managing agent voluntarily waived or surrendered is presently included in the managing agent's assessable income and asks what safeguards should condition its exclusion if provision is so made. The implications, however, seem clear. The commission of the managing agent is frequently voluntarily waived or surrendered. In the majority of cases that is done for good consideration as when the company is in its infancy or conservation of its resources is necessary for its survival. There may be other cases where there has

been waiver or surrender and the good consideration referred to was not present; the managing agent thereby avoids both income and super-tax and gains by the tax-free increment to the value of his holding in the managed company.

As to whether the commission of a managing agent, voluntarily waived or surrendered in whatever circumstances, attracts the tax is a question to be resolved by reference to the facts and perhaps not without difficulty. The element of receivability must be present and the method of accounting employed by the managing agent may be significant. However that may be, no objection may reasonably be taken if the definition of 'income' at section 2(6C) is expanded to include or the Act is otherwise amended to bring within charge to the tax the commission of a managing agent voluntarily waived or surrendered only to avoid or reduce his own liability to the tax.

Question 72.—On what basis would you suggest that double income-tax avoidance agreements should be concluded between India and other countries?

in the absence of any convention with another country income which accrues or arises abroad is presently entitled to a unilateral relief. That relief does not extend to income which accrues or arises abroad but is deemed to accrue or arise in India brought into charge to the tax by artificial device of section 42(1). So far as concerns this second class of income a non-resident may get no relief in his own country for the tax paid in India; the aggregate tax incidence may consequently exceed the income.

Even at the cost of some immediate sacrifice of revenue, it is desirable in the long-term interest of India's trade and international relations and as well to create a better climate for the attraction or foreign capital that double income-tax avoidance agreements be concluded with other countries. Such agreements should be in the form of United Nations Model Convention for the Avoidance of Double Taxation adopted by members of the Commonwealth, the U. S. A. and a number of European countries.

Question 73.—Is the present law relating to determination of "bonâ fide annual value" of property and deductions allowed from it satisfactory? If not, please give any alternative proposals you have in this respect.

Section 9 charges income from property not occupied by the subject for the purposes of any business, profession or vocation carried on by him the profits of which are assessable to income-tax. The income is to be notionally determined as the bonâ fide annual value with deducted therefrom certain allowances for repairs, insurance, interest or other annual charge, land revenue, costs of collection and vacancies.

The annual value is to be deemed to be the sum for which the property might reasonably be expected to be let on rent, reduced in case the property is let, by the tenant's liability to taxes levied by any local authority borne by the owner notionally determined.

It may be correct to hold, as did the Investigation Commission, (paras. 336/9), that there can be no allowance for the depreciation of property not occupied for business but it is surely illogical to apply municipal taxes as a deduction in a determination of the annual value having the effect of reducing the allowance for repairs, vacancies and possibly collection charges. Nor is it logical to fix the deduction for municipal taxes at one-half of such taxes or one-eighth of the annual value whichever is the less regardless of the liability of owner and tenant respectively for their payment.

The prescribed allowances should include the municipal taxes payable by the owner.

Question 74.—Is any change required in respect of provisions relating to carry-forward of losses? Are you in favour of allowing losses to be carried backward in case of cessation of business?

The period of years over which losses may presently be carried forward is approximately related to the periodicity of the advance and recession of the trade cycle. In theory at least, however, the six year period is inadequate; the profits earned at the outset of the cycle's advance may not cover the losses suffered in the first years of the recession. By ordinary standards, however, business cannot survive such a condition and it may be of no practical consequence that losses cannot be carried forward indefinitely.

A loss is to be set off against income under any other head in the same year and to the extent it is not so set off, it is to be carried forward. In a subsequent year, however, it is to be set off only against profits in the same business. That is objectionable. There seems to be no logical reason why, if a loss in business can be set off against income from investments or from another business in the year in which the loss is suffered, there should be a denial of the principle so far as concerns the excess of the loss over income under another head. Typical of much business is the company engaged in

industry and having part of its capital or reserves invested. The income from investments is taxed as income from securities or from other sources. The excess of the loss in business over that other income in the year in which the loss is suffered is not, failing the facility for a set-off against income from business, to be set off against the income from securities or other sources in the subsequent year. That position arises also in the case of life insurance business whose liabilities in its formative years usually exceed the fund and there is a deficit. The income from securities required to be held under section 27 of the Insurance Act of 1938 to cover the shortfall between the assets of the fund and liabilities is not income from the business of life insurance but is income from securities. The loss of the inter-valuation period is not to be set off against the income from investments in the subsequent year.

Income tax is a tax on the person not on business as was the excess profits tax. It is the net income of the person which is to be taxed. The restriction on the carry forward and set off of a loss is an offence against the fundamental principles of the taxation of incomes and is entirely unwarranted.

The tax laws of the U. S. A. include provision for a carry-back of loss. There is a general desire for such a provision in India also but it is thought that the time for giving expression to that desire is not now opportune. The success of India's Five-Year Plan and the hopes business may entertain for a taxation relief in this particular form are closely co-related. In case there should be a trade recession the absence of revenue will prejudice the success of the Plan. It would be most unrealistic to contemplate the further embarrassment of the State in case tax collected in preceding years were to be repaid.

There is, however, a case for a carry-back of loss if a business is discontinued. The surplus distributed by a liquidator in a winding-up attracts the tax through the definition of a dividend if it derives from the profits of the preceding six years. In case losses have been suffered during the like period resulting in a loss of capital there is hardship if these losses are not carried back at least to the extent of the capital lost. The surplus in a winding-up is not income excepting by the definition's artificial device. It is part of the proprietors' capital. If the appropriation of that capital to the State revenue is at all warranted, to the same extent is a repayment of the tax paid during the like period so far as that is related to the capital lost.

Question 75.—Do the provisions relating to the payment of advance tax under section 18A of the Income-tax Act need any modification?

There is need for amendment of sub-section (2). It is open to an assessee to lodge an estimate and to pay the tax by equal instalments on such of the prescribed due dates as have not expired. The department has already by executive instruction extended the date for lodging an estimate to enable that to be done even some days after a due date and for paying the instalment due according to the estimate although the due date has passed. That relief was found necessary in case a demand made under sub-section (1) was served on or so close to the due date as to give the assessee no reasonable time within which to exercise his right under sub-section (2); the relief may be imported into the Act by giving the assessee fifteen days from service of the notice of demand within which to file an estimate under sub-section (2) and the like extension of time for payment of the instalment.

Sub-section (6) has recently been amended to give the executive power to reduce or waive the interest payable by an assessee in such circumstances and in such cases as may be prescribed. The intention remains undisclosed since there is apparently as yet no notification on the point. If at all there is need to relieve cases falling under sub-section (6) there is clearer need still to relieve certain which fall under sub-section (8).

In case a person resident is treated under section 43 as the agent of a non-resident he is caught by the section's machinery although the section 43 notice was not first served on or before 15th March of the previous year of assessment. If for example a section 43 notice is served for the first time on 31st March, 1953 the right to file an estimate of the income of the non-resident may have already prescribed at 15th March 1951. Although there may have been no reasonable grounds for apprehending action under section 43 nor any certainty as to its outcome if such action were taken, the person held as an agent is rendered liable for interest from 1st April, 1952 and to penalties under section 28 in respect of any tax found payable in 1951-52 and 1952-53. Not only is the onus of discovering new section 42(1) assessee thereby in effect transferred to the subject but the Statute is in this respect so utterly unrealistic as to assume that a section 43 agent is able to estimate the income if a non-resident or that the non-resident will co-operate in the preparation of an estimate in advance of the institution of any proceed-

ings under section 43. It is apparently the view of the department that the estimate may be accurately made even without the non-resident's assistance. Any attempt at such an estimate must be pure speculation.

The section must be amended so as entirely to exclude assessments made under sections 43 and 42(1) and as well to make the power of substitution provided at the third proviso at sub-section (1) (a) mandatory.

Question 76.—Do the principles underlying the assessment under section 34 of the Income-tax Act need any modification?

Section 34 was extensively amended in 1939 because in its old form it had proved to be very much on the side of the evader. The amendment had the approval of the honest assessee although it was thought that the four years limitation period prescribed for cases falling under clause (b) of sub-section (1) tended to offend against the canon of certainty. So long, however, as there was no sanction even after further amendment of the section in 1948 for revision of an assessment merely to correct a mistake in law discovered within the four year period there was no great objection to it. Unfortunately, the position has been rudely disturbed by the recent decision of the Calcutta High Court in *Raja Benjoy Kumar Sahas Roy v. C. I. T.* reported at (1953) 24 I. T. R. 70 according to which information as to the true state or meaning of the law derived freshly from an external source of an authoritative character is definite information within the meaning of clause (b) of sub-section (1) of the section. If such an interpretation of the statute was possible before its amendment in 1948 it is still more so now that definite information need not subsequently be discovered.

The assessee has precisely thirty days within which to take an appeal against his assessment. If within that time he is not aware of the fact that he has grounds for appeal but he is so within one year of the passing of the order, he may apply to the Commissioner under section 33A(2) for revision of his assessment but he has no right of appeal against the Commissioner's order. If the assessee has erred in his view of the true state or meaning of the law the remedies available to him are exhausted upon the expiry of one year from date of the assessment order.

What are the remedies available to the revenue in the same condition? The Commissioner's powers of revision under the old section 33 were abrogated when the Income-tax Appellate Tribunals were set up simultaneously with the enactment of section 34 in its present form but these were later re-introduced. Under section 33B the Commissioner may revise an assessment within two years of the passing of the order but only in case the order is in his opinion prejudicial to the interests of the revenue. The assessee admittedly has a right of appeal against the Commissioner's order under section 33B but it is objectionable that the revenue should have the protection of a two years limitation period while the assessee has only one year in which to discover he has been over-assessed. The Commissioner cannot exercise his powers under the two years prescription in favour of the assessee.

The Commissioner's powers under section 33B were restored because it was thought that re-assessment under clause (b) of sub-section (1) of section 34 did not extend to a case where the assessing officer had made a mistake in law; certainly not to a case where the true state or meaning of the law derived freshly from an external source of an authoritative character. Section 34(1) (b) must now be amended so as to exclude re-assessment in such a case and its limitation period reduced to two years so that the honest assessee may the sooner have a certain determination of his liability to the tax. At the same time the limitation of time for the passing of an order under section 33B must be reduced to one year or in the alternative the limitation of time under section 33A be increased to two years; the revenue may be expected to know the true state or meaning of the law just as well as and no less timeously than the assessee.

Question 77.—What measures would you suggest for simplifying the procedure of assessment in order to reduce the cost of compliance with tax regulations?

The procedure of assessment is not at all complex and requires no great expenditure of time or money so long as the assessee keeps clear accounts and his return of income timeously filed, is accompanied by all necessary supporting data.

Question 78.—It has been suggested that the Appellate Tribunal should have powers to enhance assessments in the same manner as Appellate Assistant Commissioners have. What is your opinion?

The Commissioner has power to revise an assessment prejudicial to the interests of the revenue and in addition section 34 provide powers of re-assessment which, as is now held, extend so as to enable the executive to correct a mistake in law. The Appellate Tribunal is not an executive authority and it is the final arbiter

so far as concerns a question of fact. If powers of enhancement are given to the Tribunal what provision is to be made for an appeal against an order made on a question of fact? There is no merit in the suggestion. Powers of enhancement should vest only in the executive and must be appealable.

Question 79.—Do you recommend that an element of progression should be introduced in the corporation tax?

Question 80.—Would you advocate different rates for different types of corporate enterprises, e.g.,

- (i) small industries;
- (ii) cottage industries;
- (iii) private limited companies or what may be termed proprietary companies;
- (iv) holding companies?

Question 81.—There is a demand for the exemption of intercorporate dividends from corporation tax. Do you consider this justified and, if so, why?

Question 84.—Do you think, in view of the fact that profits distributed by a company are subjected to corporation tax, it is appropriate that they should also be charged to super-tax in the hands of shareholders? If not, what are your suggestions in this regard?

These are connected questions and are more conveniently discussed in the same context.

The corporation tax is of American origin where it was first imposed on corporations possessing certain advantages or privileges as a consequence of the conferment of a government franchise or monopoly. The profits earned were greater than were required to attract capital and to maintain production; the tax was designed to absorb the excess and it was accordingly regarded as a tax on surplus. In its contemporary form in the U. S. A. it is a tax on capital and on dividends paid and it is described at the charging section of Article 9 of the Tax Law of the State of New York as a tax payable by a corporation for the privilege of exercising its corporate franchise. It is not a tax on income.

There was a tax on corporations in the U. K. from 1920 to 1924 when it was abolished to further the development of trade. While in force it was charged at 5 per cent. of the profits of corporations other than public utility companies and building societies.

The tax was first devised when most business was carried on with unlimited liability. The corporation, it was thought, should be made to pay for the privilege of limited liability and juristic personality. Today, the corporation is the normal not the abnormal; the limiting of liability, the right to sue and be sued in its corporate name and the facility of perpetual succession are no longer regarded as privileges but they are in fact indispensable to the provision of finance for the promotion of trade and industry.

The Todhunter Committee in 1925 described it as an impersonal tax; they were of opinion that it was inequitable that income be taxed twice and recommended that the exemption limit be abolished and that thereafter the corporation tax should be allowed as a deduction in the income-tax assessment.

According to Article 366(6) of the Constitution the corporation tax means any tax on income so far as that tax is payable by companies in the case of which the following conditions are fulfilled:

- (a) that it is not chargeable in respect of agricultural income;
- (b) that no deduction in respect of the tax paid by companies is, by any enactments which may apply to the tax, authorised to be made from dividends payable by the companies to individuals;
- (c) that no provision exists for taking the tax so paid into account in computing for the purposes of Indian income-tax the total income of individuals receiving such dividends or in computing the Indian Income-tax payable by or refundable to such individuals.

Although not a tax on incomes falling into the pool of revenue divisible between the Centre and the States, it is brought within charge by section 55 of the Indian Income-tax Act as a super-tax payable in respect of the income of a company by way of an additional duty of income-tax.

What is the corporation tax? Although charged by section 55 of the Income-tax Act by way of an additional duty of income-tax that is apparently done only for convenience of assessment and collection. It has none of the characteristics of the income-tax payable by corporations; the rate of its incidence is varied by a scheme of abatements and it is not treated as the income of the shareholder to be added to his dividend and charged to the personal super-tax.

Is it a tax on privilege? If so, there is no warrant for the differential in the form of the scheme of abate-

ments since all corporations enjoy the privilege in the same ratio as income. That it is not an impersonal tax of this character is suggested by the absence of any provision for its allowance in the assessment to income-tax.

There is already an element of progression to the extent that there is a scheme of abatements regulated only in the case of smaller corporations by reference to the income quantum and in other cases by reference to the territoriality of the dividend declaration and according to the ownership and control. The maximum abatement of public companies whose income do not exceed Rs. 25,000, the distinction made between public and private companies, the minimum abatement allowed to certain foreign companies and its total denial to others associated, as they are, with the amendment by the Finance Act, 1948 of Explanation (3) to section 4 by which certain dividends declared abroad had theretofore been deemed to be income accruing or arising in British India, suggest that the corporation tax is designed to recoup the super-tax otherwise payable by the shareholders if all profits were distributed as dividend in the taxable territories. If that is indeed the character of the tax the charge must logically be abated according as the profits of a corporation are not retained but are distributed and the progressive element more correctly introduced in that form. There should be the optimum abatement when all profits are distributed.

If the corporation tax is neither a tax on privilege nor a tax on retained profits but it is an additional duty of income-tax, there is a case for its being grossed up and credited according to the provisions of sections 16(2) and 18(5) in the assessment of the shareholder as is the first or ordinary charge of income-tax.

There is no case for any rate differential for different types of corporate enterprise if the tax is a tax on privilege since all enjoy the privilege in the same ratio as income. If a tax on retained profits the present additional abatement of one anna for small industries (i.e., units whose income does not exceed Rs. 25,000) and possibly also the reduced abatement for private companies is perhaps logical. If it is an additional income-tax there may be grounds for a differential in favour of smaller and cottage industries.

For so long as the corporation tax and the income-tax are different taxes and no provision is made either for the exemption of the shareholding corporation to its charge or for its credit in the assessment of that corporation the same profits are doubly charged to the same tax. Its double incidence is accountable for the restraint almost to the point of complete elimination of the logical development of trade and industry through specialised companies otherwise to be sponsored by the parent company for the purpose of carrying its subsidiary policies into effect. In England and in the U. S. A. the parent company has provided much of the finance and initiative for the expansion of industry. All argument is in favour of and none against the exemption of intercorporate dividends from charge to the tax.

It is an offence against the fundamental principle of taxation that the same income should twice bear the same tax and it is accordingly urged that just as the income-tax paid by a company is credited to the shareholder, an intercorporate dividend must be corporation-tax-free to the shareholder-corporation which now pays the corporation tax a second time in its own assessment. The case of the individual shareholder and his liability to super-tax is not completely analogous. The super-tax has a different intent and is payable at an increasing scale. There is no case for exemption. If, however, the corporation tax is an additional duty of income-tax, it also should be included in the income of the shareholder and credited to him as tax paid on his behalf.

This Chamber is of opinion that there is pressing need to render the status of the corporation tax less nebulous. That is best done by ascribing to it the character of an additional duty of income-tax designed to recoup the super-tax otherwise lost to the revenue if profits are not distributed and, consistently therewith,

- (a) grossing the part of the dividend which has borne the tax for inclusion in income according to section 16(2);
- (b) crediting the corporation tax inclusion in the income under section 18(5) as a payment of income-tax made on behalf of the shareholder, having the effect also of exempting the corporation-shareholder so long as the rate in the year of assessment is unchanged and the two corporations have the same status in the scheme of abatements.

Question 82.—Do you think that any special provisions are necessary for the assessment of—

- (a) bank; and
- (b) investment companies?

Do existing rules relating to assessment of insurance companies, especially mutual insurance associations, require any change? If so, in what respect?

The Chamber offers no comment so far as concerns banks. The exemption from the charge of corporation tax presently enjoyed by investment trust companies under sanction of the notification of 9th December 1933 should be continued but it would seem desirable that the exemption be sanctioned by statutory amendment rather than by notification, as should all exemptions sanctioned under the powers vested in the executive by section 60 before its amendment.

The Schedule to section 10(7) of the Act requires very extensive emendation. The alternative basis of charge prescribed for the business of life insurance is objectionable not only by reason of its uncertainty but because of the definition of gross external incomes, the limitation of expenses and since, on a change of the basis to charge, Rule 4 operates so as in the one case to preclude credit for part of the tax paid or deducted at the source and in the other to allow credit for more than has been paid or deducted in the aggregate.

There can be no equitable charge to the tax on a basis which may change from one year to another especially when the basis yielding the more revenue is to be employed. Over a period of years this must operate against the company.

The cost of procuration commonly includes the commission of the agent. The commission received upon re-insuring all or part of a risk is nothing more in the hands of the original underwriter than a recovery of the commission paid in the same proportion as the risk is re-insured yet it is included in gross external incomes by virtue of the definition at Rule 5(ii); a recovery of commission is logically to be deducted from commission paid.

The limitation of expenses is in principle wrong. In the computation of what is income, the exclusion of allowance for any expenditure which by the canons of income taxation and by the statute itself is allowed the status of a revenue expenditure is unwarranted.

Rule 4 provides that where an assessment is made in accordance with the annual average of a surplus, credit is not to be given under section 18(5) for the tax paid or deducted at the source during the previous year but for the annual average of the tax so paid or deducted during the intervalation period. In case the basis of charge changes from that of the annual average of a surplus to that of gross external incomes less expenses and that occurs in the assessment next following a triennial valuation and there is no subsequent reversion to the original basis of charge, credit for two-thirds of the tax paid or deducted at the source during the intervalation period is precluded; so much of the tax is lost to the company. Upon the reverse happening the revenue suffers in the same proportion.

The need for a single basis of charge is clearly suggested without a limitation of expenses.

The Insurance Act, 1938, as now amended requires all life insurance companies to make a valuation at least once in every three years. This amendment has adversely affected companies whose practice it was to make a valuation every five years. The involuntary shrinkage of the intervalation period has caused numerous companies substantial loss by reason of the exclusion of credit for tax paid or deducted at the source to the extent of one-fifth in some cases or in others two-fifths of the tax so paid or deducted during the preceding quinquennium. Neither Act nor Schedule provide any remedy; the revenue is apparently indifferent to the submissions made on the point. It is no answer for one department of Government to say that the loss caused to life insurance business as a direct consequence of an amendment of the law sponsored by another department of the same Government derives from one of the several anomalies inherent in the Schedule by which the revenue also may suffer. It should be a matter of some concern to Government which in other ways is commendably anxious to secure the development of life insurance on a sound footing. The remedy lies in a refund to the company, either in one instalment or two, of the tax excluded from credit, subject to the deduction of any credit for tax in excess of that actually paid or deducted which the company has at any time enjoyed either as a consequence of a change in the basis of charge or by reason of an extension 'sou motu' of the intervalation period.

Question 83.—Do you think that differentiation should be made between distributed and undistributed profits of companies for tax purposes? If so, on what grounds? What change would you suggest in the present quantum of differentiation in favour of undistributed profits? Should the concession in future be restricted to particular industries?

If the tax concession in favour of undistributed profits is allowed to continue as at present or in a modified form, what measures would you suggest to ensure:

(a) that retained profits are not used as a device by shareholders of private limited companies to evade super-tax;

(b) that retained profits are actually applied for productive purposes?

In particular, are the provisions of Section 23A of the Income-tax Act satisfactory? If not, what changes would you suggest?

There is a close connection between the purpose underlying the differentiation and the condition in which trade and industry must conserve their resources and so survive. The differentiation is designed to go some way to counteract inflation. A policy of dividend limitation is to be observed if provision is to be made for the replacement of capital assets, materials and merchandise expended during the inflationary period. The former encourages the latter and so the two are complementary. It is accordingly thought that the differentiation between distributed and undistributed profits must continue for so long as no alternative adequate relief is provided for the replacement of assets. If at all changed the abatement of income-tax allowed since 1948 must be increased.

The private sector is to make an important contribution to India's 5-Year Plan. That contribution is not to be made only by the industrial undertakings to which sections 15C and 56A of the income-tax Act apply but it is to be made also by undertakings established before 1st April, 1948 and by industries other than those specified. There is no case for a restriction to particular industries. Nor is there better assurance for the employment as a contribution to the Plan of any higher dividends paid as a consequence of denial or restriction of the differentiation.

The private limited companies referred to at the second part of the question are presumably those to which section 23A applies. The word 'evade' at question (a) is presumably intended to be read as 'avoid'.

There is in fact no direct connection between the retained profits of private companies and the income-tax abatement referred to as a concession in favour of undistributed profits. Under section 23A the quantum of the dividend to be paid is virtually regulated and compelled. It is not appropriate to ask how, having been encouraged to observe a policy of limitation by the grant of a concession, there may be assurance that there is no super-tax avoidance.

Section 23A permits a private company to save some 22½ per cent. of its income and its shareholders to escape super-tax in the same proportion. Is it implicit in the question that only a public company must reserve a part of earnings against the hazards of an uncertain future or for development of its undertaking? So long as saving is considered a virtue and the tax is payable only on what is income, the super-tax must be avoided to the shareholder to the extent that the private company does not distribute all of its earnings for so long as the saving is less than the capital.

In the wider sense the retention of profits is by itself productive to the extent that there is a saving available for investment. It is not true to say that profits saved and reserved primarily for the protection of capital and not employed to increase the productive capacity of the existing unit are not applied for a productive purpose.

These criticisms lie against section 23A:—

- (a) it should not apply to a company in which more than 50 per cent. of the voting power is controlled directly or indirectly by one or more companies in which the public are substantially interested;
- (b) the liability of the shareholder may be uncertain for so long as six years after the dividend is declared; there should be a time limit for certainty which may conveniently be ninety days after the date at which the time for taking any appeal against the company's assessment has prescribed and no appeal is pending;
- (c) the profits to be distributed for the avoidance of its provisions should be only one-half of the remainder after the payment of taxes, leaving one-half for saving; very few public companies distribute so large a proportion as 60 per cent. of the residue;
- (d) account should be taken of losses subsequently suffered so far as these are ascertained before the date of the passing of any order when the shareholders may have lost all or part of their capital;
- (e) account should also be taken of distributions in preceding years exceeding 60 per cent. of the residue; these should be carried forward and set off against any short-fall appearing in the year under review;
- (f) the company should have opportunity to distribute the shortfall from 60 per cent. after the assessment is final;
- (g) income of a notional character such as that brought within charge by sections 42(2) and

10(2) (vii) should be excluded from the assessable income;

(h) profits whose remittance is blocked should be excluded from assessable income;

(i) a sum paid for a licence to manufacture or for technical assistance whether in cash or in shares being in the nature of capital or deferred revenue expenditure and so not admissible as a deduction under section 10(2) and other expenditure of a quasi-capital nature laid out to acquire or exploit a wasting asset should be treated as a deduction from assessable income to the extent to which it is charged against the profits of the year;

(j) sums reserved for the payment of retiring gratuities to workers and for the rehabilitation or replacement of assets should be treated as a deduction from assessable income; and finally;

(k) the executives are variously interpreting the decisions in *Sir Kasturchand Ltd.*, and *Ezra Proprietary Estates Ltd.*; the department should publish an official interpretation so that private companies may know what treatment to expect; it is of no consequence and there will be no grounds for complaint if a conflicting or over-ruling judgement later appears

Question 85.—Would you consider that industrial, commercial and similar other enterprises undertaken by the Centre, the States and Local Bodies should be required to contribute, from their earnings in the way of income-tax or in other ways, to general revenues?

As a general rule the income of all State or Local Government enterprise should be charged to the taxes on income; the measure of efficiency in its conduct is not otherwise to be properly disclosed and unfair competitive capacity is added against the private sector in the same sphere. There are exceptions to that rule. Certain services are virtual monopolies of the State as railways, posts and telegraphs and the provision of ordnance and of local Governments as the supply of water. On the other hand, the income of State or local Government enterprise which is also in the sphere of the private sector or which operates in the same field as private enterprise should not be exempted from the charge. Notable examples are power and road transport, the supply of milk, brewing and distilling and the manufacture of anti-biotics.

Question 86.—What measures would you suggest for the greater use of the services of Chartered Accountants for assisting in the determination of the taxable income of assessee? What obligations should be placed on a Chartered Accountant when he certifies a statement of accounts of an assessee for purposes of income-tax assessment? In particular, with a view to minimising evasion of tax, would you recommend that the certificate of a Chartered Accountant should invariably accompany the return for business income over a certain limit? If so, would you suggest that a form of certificate should be prescribed indicating the scope of the check that should be exercised by Chartered Accountants who render the certificate mentioned above? Do you agree that fees payable by assessee to Chartered Accountants for such certificates should be restricted to a schedule to be prescribed by Government?

The question appears to contemplate and propose amendment of the Act so as to require (a) every business assessee to employ a chartered accountant and (b) a chartered accountant so employed to certify the assessable income. Even in cases where the accounts are presently audited and certified for compliance with the relative provisions of the Companies' Act, performance of the audit does not necessarily require that degree of research necessary for the computation of the assessable income or, at the least, for the disclosure of expenditure not to be allowed as a deduction under the Income-tax Act. The accounts of business are designed to disclose a true and correct view of the state of the business according to and consistent with normal commercial principles and practice and the statutory law, not including the income-tax law. They are not designed to disclose the assessable income. The proposal is considered wholly impracticable and accordingly the further questions as to how it may be carried into effect do not arise.

Question 87.—What changes would you suggest in the present law relating to the representation of assessee before Income-tax authorities (section 61) in order to ensure—

(i) effective representation of assessee at reasonable fees;

(ii) a minimum level of proficiency on the part of representatives regarding the subject of income-tax law, rules and regulations?

The question in its first part, appears to suggest that the assessee is not now effectively represented for a

reasonable fee; if that is so it is a state of affairs for which the assessee is himself responsible. Adequate representation at moderate cost is available to the honest assessee; is it possible that the scale of the representative's remuneration varies in direct ratio as the degree of evasion practised by the assessee? Sub-section (3) of section 61 should be amended to provide more rigorous penalties for misconduct on the part of a representative.

Question 88.—Will it assist in checking evasion if the names of the persons who are penalised for concealment of income are published?

At the least the publication of the names of persons penalised for evasion will not encourage its practice. So long, however, as public opinion is insensitive and unresponsive only the least odium will attach to the person whose name is published. If evasion is to be checked section 52 should provide for rigorous imprisonment for a longer term without the option of a fine and sub-section (2) of section 53, giving the Inspecting Assistant Commissioner power to compound the offence, should be repealed.

Question 89.—Do you think that the present practice of excluding, from taxable profits, perquisites given to employees of business undertakings results in considerable loss of revenue? If so, please state the perquisites you have in mind, and how they should be dealt with for the purposes of taxation.

The allowance to be made in computing the profits of business are specified at section 10(2) and include (clause xv) any expenditure laid out or expended wholly and exclusively for the purpose of the business. The exclusions from taxable profits are both in law and in practice only the allowances specified at section 10(2). There is no sanction for the allowance of a perquisite as such although anything which may come within its meaning in the hands of the employee may be admissible as a deduction under section 10(2) as an expenditure laid out or expended wholly and exclusively for the purposes of the business. That test is invariably applied when computing the profits of business.

Question 90.—In the case of a company under liquidation, what steps if any would you suggest for safeguarding payment of tax dues before any payments are made to shareholders?

This question is closely concerned with that put at No. 95 and possibly also that put at No. 94. It is prerequisite to recovery of the tax in all cases that both assessment and recovery proceedings be instituted without delay.

The question is not too happily conceived. The State has precedence at common law in respect of income-tax arrears over unsecured creditors. Under the Companies' Act the State enjoys a substantial degree of priority in respect of taxes which have become due and payable within one year before the commencement of the winding-up or the date of the winding-up order according as it is a voluntary or a compulsory winding-up. If the completion of assessments has been delayed and orders are passed and demands issued only after the company has been taken into liquidation the State has no priority in respect of such demands. The question of safeguarding recovery once the company is in liquidation arises only if it is contemplated that the department may neglect to file a notice of claim or that the liquidator may alienate assets which have come to his hands. No form of safeguard should be necessary to protect the revenue against the first contingency. If assets are alienated the liquidator renders himself personally liable for the loss to the revenue under the provisions of the Companies' Act.

Question 91.—Do you think that, in order to minimise evasion and avoidance of tax, there is a case for conferring larger powers on income-tax authorities? If so, what further powers should be given to them? In particular, should powers to search premises and seize documents and books of accounts be given to income-tax authorities? If so, what is the lowest grade of officer on whom you would confer these powers?

The reference to avoidance in the same context as evasion is inappropriate. The subject is entitled so to arrange his affairs as to avoid the tax or reduce his liability to it so long as that is not done in breach of the law. The powers conferred by the Act, if honestly, vigorously and intelligently applied, are already adequate for the detection of evasion. Any encroachment on the liberty of the subject as the question contemplates would be intolerable and it is thought unlikely, in any event, that the dishonest assessee who practices evasion by concealing his transactions will keep accounts and documentary evidence where they are likely to be discovered, if at all he keeps them. The investment of further powers in the executive officers of the Department has no popular sanction judged by the fact that the Select Committee amended the Bill of 1952 by requiring the previous approval of the Commissioner for the exercise of the power to require submission of a statement of wealth.

Question 92.—What precautions are necessary and possible to prevent the creation of an artificial legal entity—a trust or a private limited company or a partnership, especially family partnership—either for avoiding payment of income-tax or for fractioning of income to escape higher rates? Would you recommend the use of penalty rates of tax to minimise such practices?

The expression "artificial legal entity" is a novel one and its meaning somewhat obscure. Reference is presumably intended to cases where the existence of a partnership is held out where none, in fact, exists but one or more of the partners are real and the others bogus or where a trust claiming to escape the mischief of sub-section (3) of section 16 has been created but the settlor continues to enjoy the income or a company formed with capital subscribed by nominees of the person providing it who alone is in receipt of the dividends paid. In such cases it is for the executive to register the partnership or not, to tax the trust income as the income of the settlor if the beneficiaries do not enjoy the income and to tax the dividends as the income of the real owner in case the nominees are not able to show that they acquired the shares from their own monies and they have received the dividends for their own account and advantage. When application is made for registration of a partnership the onus of proof is upon the persons making the application. In the other classes of cases the onus of proof is on the Department.

In all such cases the person seeking to avoid or reduce his liability to the tax should be liable under the Act's penal provisions if he is not now so liable.

Question 93.—In the case of a registered firm, would you advocate recovery of unrealised tax of any partner from the firm as such or from other partners?

This Chamber is against any proposal for recovery of the tax from a person or persons not enjoying the income.

Question 94.—Are present arrangements relating to recovery of income-tax adequate? Would you advocate the Income-tax Department having separate machinery for enforcing the recovery of arrears of tax?

The existing provisions for the recovery of arrears are quite adequate and no separate machinery is necessary. The question at its second part refers specifically to arrears of tax but there would be less non-recovery if assessments were timeously completed. That the question should at all arise appears to suggest only that assessments are not made nor is action for recovery taken in time.

Question 95.—What provisions should be made to ensure timely collection of tax from private limited companies? Do you consider that liability for payment of tax in such cases should be placed upon shareholders of the company in proportion to their shareholdings?

Timely assessment is pre-requisite to timely collection of the tax. Assessment proceedings must be rigorously instituted especially in cases where no payment has been made under section 18A or no provisional assessment made. While regretting that evasion of the tax may be possible by an alienation of assets this Chamber is strongly opposed to any proposal designed to transfer the liability for its payment to the members of the company. Such an alienation of assets is a fraud on the revenue; it is for the department to see that suitable provision is made for its punishment if indeed such provision does not now exist.

Question 96.—If income from any property is included for assessment purposes in the hands of a person other than the ostensible owner, would you agree to the tax so assessed being also made recoverable from such property?

It is assumed that what is envisaged here is an amendment to the Act providing for attachment of property for the purpose of recovery of tax from an assessee who has included in his return income from that property although the property stands in the name of another. Presumably such an amendment would be on the footing that the fact that the income was included in the assessee's return is evidence of his beneficial ownership of the property. This would not appear to be objectionable. If a person enjoys the income from any property it seems reasonable that the property should be security for the tax payable. A provision would however have to be made for trust property. If the assessee merely had, say, a life interest it would not be proper for the trust fund to be destroyed. If action was being taken on the lines suggested it would also be necessary to make provision for the assessee or any other person interested to prove that the property did not in fact belong beneficially to the assessee.

Question 97.—What concrete measures should be taken to improve the relations of the Income-tax Department with assessee, especially in regard to—

- (i) provision of free advice to small assesseees on the following points :
 - (a) maintenance of accounts in a form acceptable to the Income-tax Department; and
 - (b) matters such as filling returns of income, claiming refunds, facilities for tax payment, expeditious disposal of assessments, etc.;
- (ii) provision of information on various matters relating to assessment proceedings, such as, disposal of refund applications, adjournment applications, examination of records, etc.;
- (iii) arrangement of work so as to obviate the necessity of assesseees or their representatives having to wait in Income-tax Offices for unduly long periods; and
- (iv) securing of the largest measure of agreement on facts between the assessee and the department at Income-tax Officer level?

In a condition in which the rates of tax are so high as to be considered oppressive, many assesseees exercise the utmost of their ingenuity to conceal their incomes and the tax department has been rapidly expanded and includes a high proportion of relatively inexperienced officers, a measure of mutual distrust and resentment is perhaps not entirely avoidable.

The Income-tax Investigation Commission made a number of recommendations at paras. 443, 444 and 445 of their Report to the end that there should be an improvement in relations between the department and assesseees. These enjoin a certain course of conduct upon the Income-tax Officer but the Commission was critical of a system in which his ability is measured by his success as a collector of revenue. It appears too frequently to be the case that the Inspecting Assistant Commissioner is responsible for the continuance of the state of affairs proposed to be remedied by the Commission.

Apart from the generality the remedy lies with the Department so far as concerns these practices in particular:—

- (a) appropriation of a refund due against a dormant demand (e.g., tax attributable to D. I. T. relief) in breach of Central Board of Revenue instructions;
- (b) the postponement of a section 23(3) order when that will result in a repayment of all or part of the instalments paid under section 18A; the Department should secure amendment of the Act to make a provisional assessment mandatory within 30 days of the filing of the return;
- (c) delay in giving effect to orders passed in appeal or in revision in case a repayment is to be made;
- (d) the adverse exercise of the discretion allowed by the third proviso to section 18A(1); when the assessment of a subsequent year is completed and the income assessed is less than was assessed in the preceding year there should be no abstinence from exercise of the discretion but the lower demand for payment in advance should be substituted;
- (e) requiring the attendance of the assessee for an undisclosed purpose which may prove to have no direct bearing on any pending assessment; the inquiry is more conveniently made in writing;
- (f) including in the income assessed an expenditure concerning which no inquiry has been made during the assessment proceedings thus causing the inconvenience and cost of taking an appeal which must and does succeed.

The Investigation Commission discussed the difficulties arising out of small assessments at para. 201 of their Report but made no recommendations so far as concerned maintenance of accounts in a form acceptable to the Department. At para. 446 of their Report they discussed a proposal for the appointment of an Inquiry officer whose duty it would be to help small assesseees to complete their income returns but they viewed more favourably a proposal for the appointment of a Complaints officer whose duty it would be to look into complaints and grievances of a general character. Proceedings in any assessment must be completed in a spirit of mutual co-operation if both the Income-tax Officer and the assessee are to be satisfied with the result. There is a tendency, however, to emphasise too much the responsibility of the Income-tax Officer and too little that of the assessee. The limit of exemption is not now so low as to warrant the presumption that the assessee is entirely ignorant of the significance of the assessment procedure; a solution for present difficulties may be found if the Commissioner were to maintain a panel of persons entitled under section 61 to appear in proceedings under the Act who would advise small assesseees on the maintenance of accounts, the filing of returns, refund applications and appeals at a time scale of

remuneration which need not be disproportionate to the resources of the class of assessee for whose benefit the panel would be maintained. It would be necessary to prescribe the upper limit of income of the class entitled to the benefits of the arrangement, the principal merit of which would lie in the fact that the small assessee would no longer be entitled to complain that he is unjustly assessed only because of his ignorance of his rights under the Act.

The largest possible measure of agreement on facts may be secured if the Department will devise a questionnaire in a standard form appropriate to each type of business carried on and the assessee is required to complete that questionnaire and to file it with the income return and if the Income-tax Officer makes proper inquiry concerning a receipt or an expenditure before including it in the income assessed.

Question 98.—What changes would you suggest in the existing arrangements relating to:

- (i) issue of notices;
- (ii) simplification and filing of returns;
- (iii) levy of penalties;
- (iv) recovery of tax; and
- (v) appellate procedure and machinery, particularly with reference to administrative control over Appellate Assistant Commissioners?

The investigation Commission discussed at some length the representations made concerning the status of Appellate Assistant Commissioners and recommended (numbers 148 to 151) that they be removed to the control of the Appellate Tribunal, a number of senior subordinate judges be recruited as well as persons holding appointments in the Judicial and Income-tax departments and they should have the prospect of promotion to the Appellate Tribunal. These recommendations have not been adopted.

On the contrary the Finance Minister has recently been reported to have expressed himself in favour of the status quo on the grounds that the first appeal against assessment in other countries is to be made to an executive of the tax department. That is certainly not so in the United Kingdom where the powers of assessment are vested in Commissioners of several classes who also are to hear and pass orders in appeal. The only qualification of these Commissioners is that they are persons of substance and respectable citizens.

By training and experience the Appellate Assistant Commissioner is unsuited to the discharge of a judicial function. In spite of the administrative instruction on the point it is patent that his decisions are influenced by considerations of revenue and promotion prospects. The assessee's appeal is frequently upheld if the Income-tax Officer has quite clearly gone wrong but only rarely if its upholding requires the assumption of any degree of independent responsibility. He is under the control of the Central Board of Revenue not only so far as concerns the persons or classes of persons or incomes or classes of incomes and the area in respect of which he is to discharge his functions; it is possible to bring evidence to show that the control extends to denial of the benefits of a rule established by one of the High Courts.

Every argument is in favour and none against adoption of the recommendations of the Investigation Commission.

Question 99.—(a) Do you think that undue delay occurs at present in the course of assessment proceedings? If so, what do you attribute this to and what are your suggestions for remedying this?

(b) In order that delays of the kind mentioned above do not appreciably affect collection of a substantial portion of the tax due, should any special concessions be provided to assessee to induce them to make advance payment of tax?

There is no doubt that the completion of assessments is in many cases unduly delayed in these circumstances:—

(a) the income return and the assessee's accounts indicate a loss;

(b) a provisional assessment has been made under section 23B;

(c) the income return and the assessee's accounts indicate that completion of the assessment must result in repayment of all or part of the tax paid in advance under section 18A;

(d) the assessment is large or is complex requiring time and labour; it counts only as one of the quotas to be completed and accordingly completion may be deferred until the limit of time prescribed at section 34(3) is about to expire; in the meantime the Officer may be transferred or promoted.

The remedy lies in amendment of the Statute so as to reduce the period of limitation in cases not falling under section 34(1) by two years.

There need be no consequent delay in collection of the tax due. In cases where section 23B cannot be invoked for want of the income return, the Officer may

in the alternative exercise his powers under section 23(4). The question of need of special concessions to induce advance payment of the tax does not arise.

Question 100.—What, in your opinion, would be the circumstances which would justify the levy of Excess Profits Tax or special business taxes?

The levy of an Excess Profits tax or special business taxes is justified only in case trade and industry is otherwise to secure an advantage not to be enjoyed by the individual as in a state of national emergency. In the inflationary conditions created by a state of war, actual or potential, the profits accruing to trade and industry from the increased expenditure of public money should be recouped by the State through the medium of a tax designed for that purpose without at the same time promoting inflation, inefficiency and reckless expenditure as did the Excess Profits tax introduced in 1940.

Question 101.—What are your main reactions to the Estate Duty Bill at present before Parliament?

In the context of the modern concept of social justice and clause 2(b) of the Commission's terms of reference which refers to the objective of reducing inequalities of income and wealth the proposed Estate Duty is unexceptionable. It may have no popular appeal since the subject can never unreservedly approve a new tax but the proposed duty has the merit that it can never reasonably be said to destroy the incentive to produce and to earn; there is greater merit if the revenue from the duty is applied to reducing the tax burden on incomes.

The need for international conventions for avoidance of double duties should not be neglected.

Question 102.—Would you in the matter of rates of levy differentiate between self-acquired property forming the estate of a deceased and property inherited by him?

There should be no differentiation between rates of duty in the case of self-acquired property and inherited property; it would be extremely difficult in practice to do so as there would be endless disputes as to which was which. If Estate Duty is to be levied at all there are no grounds for such a distinction. Provision must, however, be made for the grant of relief in a case of quick succession so that the same property does not at once take the full blow of a second levy of duty. The Bill, as drafted, so provides.

PART III—COMMODITY TAXES (CENTRAL AND STATE)

CUSTOMS

Import Duties.

Question 103.—Do you think that any changes are necessary in the Indian Customs Tariff in respect of—

- (i) grouping of commodities;
- (ii) additions to and alterations in tariff items;
- (iii) correlation with the Import Trade Control Schedule;
- (iv) clarification in nomenclature and in units of measurement or weight.

The Chamber has felt for some time the need for revising the Customs Tariff Schedule, and when Dr. P. M. Mukerji, the then Director-General of Commercial Intelligence and Statistics, was deputed by the Government of India in July 1952 to revise the Import Trade Control Schedule, he was asked when he met representatives of the Chamber in Bombay, whether this revision of the I.T.C. Schedule was going to assist in any way in correlating it with the Customs Tariff Schedule. His answer to this question was that the Customs Tariff was outside his terms of reference. It became increasingly evident that importers generally were experiencing hardship due to the differences in the description of goods existing in the two schedules which involved them in numerous disputes with the Customs. This Chamber accordingly took the opportunity to move the following resolution at the Annual General Meeting of the Associated Chambers of Commerce held in December 1952, which was adopted unanimously and forwarded to the Government of India:—

"This Association recommends to the Government of India that, while the Import Trade Control Schedule is being revised, the opportunity should be taken also to revise and enlarge the Indian Customs Tariff to make it more suitable to the present-day pattern of trade and to correlate with it, so far as possible, the Import Trade Control Schedule."

The Import Control Schedule as it stands at present contains, in Parts I to VI, 601 items each of which has been given a serial number, and in many of the serial numbers there are further sub-divisions. In the First Schedule to the Indian Customs Tariff, which regulates the rates of duty to be charged on every dutiable article entering this country, there are only 87 items, the last

one being "all other items not otherwise specified, including articles imported by post". Since this Import Tariff was framed the pattern of the country's trade has undergone a substantial change. A number of items specifically provided for in the Tariff are not now imported; some were specifically included to meet special circumstances not now arising. On the other hand, there are numerous new commodities and articles which are not included except under a general heading. To enumerate the large number of commodities of all kinds and sorts, particularly under the heading of "Chemicals, Drugs and Medicines", which now form a part of the trade of this country but did not do so when the Tariff was framed, would take much too long. In any event, it is unnecessary because the answer is to be found in the Import Control Schedule.

The situation today is that there are hundreds of items in this Schedule which are licensed for import under varying conditions and in respect of which it is quite impossible for importers to ascertain from a reference to the Customs Tariff what duty will be payable on the goods when they arrive, or even whether they will be allowed clearance. The doubt about clearance of the goods arises because, in many instances, when an importer is applying for a licence he cannot definitely state in his application the item number in the Customs Tariff under which the goods will be classified. There have been numerous cases in which importers have received licences for the import of certain commodities and, relying upon these licences, have arranged for the import of the goods, only to learn on arrival that they are quite differently classified by the Customs Authorities. In the result, penalties have had to be paid and, pending settlement of the matter, heavy demurrage charges have been incurred.

Another difficulty which arises is in regard to Open General Licences. An importer may order certain goods, the description of which, in his opinion, tallies with that given in the Open General Licence. On arrival of the goods he may find the Customs Authorities taking a different view and so classify the goods that a specific licence is necessary. The importer is then faced with the charge of bringing in unauthorised goods and, again, the question of a penalty arises or, in the alternative, the goods are confiscated or ordered to be re-shipped. Resulting from the extreme difficulty of reconciling the Import Trade Schedule items with the Customs Tariff items, *bonâ-fide* mistakes have occurred which frequently have proved to be very costly. The correct understanding of the Import Tariff is not made any easier by the numerous footnotes referring to amendments made from time to time by Government notifications. For example, against the item "Chemicals, Drugs and Medicines, all sorts", there are no less than eight asterisks and other marks necessitating reference to an equal number of footnotes.

Dr. Mukerji, it is understood, has now submitted his report to Government and his proposals for a revision of the Import Trade Control Schedule are possibly under consideration. It is therefore suggested that an early opportunity should be taken to have the Customs Tariff Schedule revised on the same lines, so that the descriptions of articles in both the Schedules will be uniform. Only then will it be possible for importers to estimate beforehand what rate of duty they may have to pay on the goods they import, provided of course the goods conform to the description given.

The units of weights and measures adopted should accord with international standards.

Question 104.—(i) What considerations should govern the fixation of rates of import duties for different groups or sub-groups of commodities or for special tariff items?

The primary considerations should be revenue and the protection of industry to the extent recommended by the Tariff Commission. Rates should be fixed with due consideration to the importance of each item in the country's economy.

(ii) Have you any modification to propose in the present rates of duties in the light of the considerations suggested by you?

The Chamber is of opinion that certain duties afford too great a measure of protection to indigenous industry, with the result that the latter does not always find it necessary to improve quality.

(iii) Do you consider that import duties should be reduced in respect of any specific commodities in order to reduce the scope for smuggling?

No comments.

(iv) Are there any cases within your knowledge where duties on the constituent parts are higher than on the finished product? Is there adequate justification, in your opinion, for this differentiation?

No comments.

(v) Do you think that owing to high rates of duties the yield on any commodity has reached the point of diminishing returns?

While it is true that high rates of import duty are likely to have an adverse effect on the volume of

imports and consequently on customs revenue, in a system of rigorous import control it is not possible to assess whether a point of diminishing returns has been reached.

Question 105.—Is the relative use of ad valorem and specific duties in the Indian Customs Tariff satisfactory? If not, in what respects would you enlarge or restrict the scope of application of either, whether used singly or in combination?

The present use of ad valorem and specific duties as laid down in the Customs Tariff Schedule is working satisfactorily and the Chamber recommends no change in the scope of application of either.

Question 106.—(i) In what circumstances would you consider 'tariff values' a satisfactory basis for assessment of import duties? (Section 22 of the Sea Customs Act.)

(ii) Are there any commodities to which you would extend the application of "tariff values"?

(iii) What changes, if any, should be made in the procedure for determining 'tariff values'?

Tariff values should be fixed only in respect of those commodities whose prices are fairly stable throughout the year. Before tariff values are fixed it is recommended that the trade should be consulted, as experience in recent months has shown that there have been instances where tariff values have been fixed in relation to market prices which existed several months prior to the enforcement of the tariffs and when they were unduly high.

Question 107.—(i) What changes in your opinion are necessary in the present provisions (Section 30 of the Sea Customs Act) regarding the determination of 'real value' and why?

The Chamber is very seriously concerned at the manner in which the Customs authorities disregard the statutory provisions of the Act in regard to the determination of real value under section 30 and at the methods of assessment now employed. As a consequence importers are unaware of the extent of their liability under the Sea Customs Act. The Chamber submits that Collectors should first advise importers of their proposed intention so to alter the methods of assessment, and the reasons therefor, and should grant an opportunity to the importers to discuss the matter with the appropriate authority in the Customs House before action for assessment is actually taken. Article (vii) of the General Agreement on Trades and Tariffs which was signed at Geneva on the 30th October 1947, to which India is a signatory, lays down the broad general principles of valuation for customs purposes, and paragraph 2 of this Article which covers actual value, reads as follows:—

(a) The value for customs purposes of imported merchandise should be based on the actual value of the imported merchandise on which duty is assessed, or of like merchandise, and should not be based on the value of merchandise of national origin or on arbitrary or fictitious values.

(b) 'Actual value' should be the price at which, at a time and place determined by the legislation of the country of importation, and in the ordinary course of trade, such or like merchandise is sold or offered for sale under fully competitive conditions. To the extent to which the price of such or like merchandise is governed by the quantity in a particular transaction, the price to be considered should uniformly be related to either (i) comparable quantities, or (ii) quantities not less favourable to importers than those in which the greater volume of the merchandise is sold in the trade between the countries of exportation and importation."

Paragraph 5 of the same Article states that the basis and methods for determining the value of products subject to duties or other charges or restrictions based upon or regulated in any manner by value should be stable and should be given sufficient publicity to enable traders to estimate with a reasonable degree of certainty the value for customs purposes. It is recommended that Collectors of Customs should be asked to adopt this procedure so as to enable importers to know in advance their liability for customs duty. The same principles should be adopted in the assessment of export duties. Reference may be made to the Chamber's reply to Question 113.

(ii) Would you suggest any specific measures to counter the evasion of import duties through deliberate under-valuation?

If the Customs appraiser considers that a shipment is under-valued, he has the power under Section 30 of the Sea Customs Act, to make an assessment on the market value subject to the present right of appeal.

(iii) Have the methods of valuation in the Sea Customs Act proved satisfactory in relation to trade through the Land customs border, especially on the Indo-Pakistan border? If not, have you any specific suggestions to make in this regard?

The Chamber has no comments to make on this question.

Question 108.—What changes would you suggest in the matter of granting exemptions from, or reductions in, import duties especially in regard to:

- (1) raw materials used for essential industries;
- (2) materials used for scientific research;
- (3) materials imported for charitable and humanitarian purposes;
- (4) materials imported for stimulating desirable activities, such as agricultural development; and
- (5) necessities of life?

All of the materials to which reference is made and as well the capital plant and equipment for industry should be exempt from duties or at the least bear the lowest rate of duty.

Question 109.—To what extent do you think revenue might be sacrificed in the interests of bilateral and multilateral fiscal arrangements such as G.A.T.T. or the preferences in favour of certain Commonwealth countries?

Revenue may be sacrificed in the interests of bilateral and multilateral trade arrangements.

Question 110.—Under what circumstances should customs duties be used in preference to import quotas as a means of restricting imports?

Reference may be made to the reply to Question 104(1); the primary considerations which should govern the fixation of rates of import duties are revenue and the protection of industry. So long as foreign exchange control is necessary the restriction of imports by a manipulation of customs duties cannot be practicable.

Import control for the purpose of protecting indigenous industry should only be resorted to when recommended by the Tariff Commission after due enquiry and only to the extent that may be recommended by the Tariff Commission.

Question 111.—In what respects should the present law regarding "drawbacks" and "warehousing" be altered in order to assist the export trade in manufactured goods which involve the use of imported raw materials?

The principle of drawback should be extended to all exports of manufactured articles in which imported raw material is used.

Question 112.—Have you any suggestion to make regarding the administration of the Sea and Land Customs Acts, especially in regard to—

- (a) facilities for settlement of disputes arising out of appraisement;
- (b) penalties imposed under the Act and the appellate procedure relating to them?

There is at present no statutory provision for the settlement of disputes arising out of appraisement nor any right of appeal from an order of the Chief Customs Authority for which the discretion vested in the Central Government under Section 191 of the Sea Customs Act is unsatisfactory.

Article X of the General Agreement of Tariffs and Trade, to which India is a party, requires the setting up of tribunals for the prompt review and correction of administrative action. Existing procedures do not 'provide for an objective and impartial review of administrative action' and India is accordingly not entitled to claim exemption from the operation of the covenant. Regardless of the provisions of GATT there is a compelling need for independent judicial machinery for the prompt review and correction of administrative action. Reference may be made to the Chamber's replies to questions 107 and 113.

Export Duties.

Question 113.—Under what circumstances, in your opinion, should export duties be imposed?

An export duty should be imposed only when there is need to maintain parity between internal and external prices. It should never be imposed for revenue considerations. Necessarily operating with retro-active effect, the sanctity of the contract is violated. According as the contract provides, the duty imposed is a loss either to the exporter or to a foreign buyer who has already re-sold the goods. An example of the retro-active effect of an export duty and flagrant disregard of the sanctity of contracts by the executive is provided by the action taken by the Indian Customs in 1952 when the method of assessing the duty on manganese ore was summarily altered, setting aside contract prices theretofore accepted as the basis of assessment and substituting an arbitrary value at the time of shipment. In the result forward contracts made in a rising market as long as two years previously are artificially surcharged as much as 90 per cent. above the official rate of duty. Buyers are naturally incensed and conclude the Indian Government would revert to the contract price basis if the market were to fall. Their search for alternative sources of ore is therefore intensified and with reported good prospects of success in Brazil and Africa in both of which new mines are in process of development.

Question 114.—What measures would you suggest to achieve greater flexibility in the rates of duties to accord with the changing conditions of export markets?

Bureaucracy does not quickly respond to altered conditions; duties are tardily withdrawn or relaxed after the event and foreign markets are lost. Once imposed the effect of an export duty must be closely watched and careful attention paid to the advice of the non-official advisory committees at each major port.

Question 115.—Would you suggest that the whole or a part of the receipts from certain export duties should be funded for financing schemes for promoting long range development of the export trade, subject to the obligations under G.A.T.T.?

The Chamber is generally opposed to the appropriation of a tax or duty for specific purpose. Long-range development may be left to the interests concerned.

Question 116.—Would you in the interests of revenue or from any other point of view, recommend increased participation by the State in import and export trade? If so what form do you think should such participation take?

The function of Government should be confined to such legislation and controls as may, in the circumstances existing at the time, be necessary to ensure an overall balance by, for example, exchange control and quantitative control of exports and imports where this is necessary, either because of shortages of certain commodities or to ensure that available foreign exchange is expended on essential imports. Except in these circumstances or in the event of a grave emergency the State should not participate in the country's foreign trade on any basis, either monopolistic or otherwise. The machinery of Government is not equipped for efficient operation in the sphere of commerce.

Central Excises.

Question 117.—Do you regard as satisfactory the present selection of commodities for purposes of levying excise duties? If not, what changes would you suggest and why?

There is nothing inappropriate in the levy of excise duties on articles of common use or consumption in a country where so few have the capacity to bear any form of direct taxation and so large a part of the revenue must come from indirect taxation. The duties are appropriately imposed *inter alia* on articles whose import from abroad is prohibited or precluded by prohibitive import duties.

Question 118.—(i) Have you any changes to suggest in the present rates of excise duties?

- (ii) Are the provisions regarding valuation satisfactory where ad valorem excise duties are levied?

The rates of duty should be more flexible; at the same time imports should not be prohibited nor precluded by high customs duties. There should be a constant equation or near-equation between the two so that regular imports may be possible. In the absence of that check the rate of the duty is fixed only by reference to revenue considerations; the indigenous industry as a whole need not produce at an economic cost and the price to the consumer is accordingly higher. The more efficient units in the industry would be able to sell in competition with the imported article if excise and import duties were co-related.

The incidence of the duty on competing commodities should be equal.

Question 120.—Do you think that the lower rate of duty on the cottage match industry has been helpful to its development? If not, would you suggest any change in the existing rates of duties?

The Chamber is informed that the differential favouring the cottage match industry has resulted in its substantial growth between 1946 and 1950.

Question 121.—Do you think that the arrangements for the assessment and collection of excises in respect of manufactured and unmanufactured commodities require simplification? In particular, please comment on the present system as regards

- (a) licensing,
- (b) warehousing, and
- (c) transport of excisable commodities.

The arrangements for assessment and collection are generally satisfactory although attended by the usual difficulties arising out of the absence of ability to take decisions at the lower levels of the administration and the non-disposal of appeals. There is scope for economy in the administration especially at factories where the system of control need not be so complex as at a distillery. Recommendations made by an adviser lent by the U. K. Government shortly after the war were apparently not adopted.

Question 122.—Do you agree that a part of the proceeds of excise duties may be earmarked for expenditure on research and development schemes designed to improve the quality and marketability of the commodities?

No direct appropriation for expenditure on research and development schemes should be made from excise duties.

Question 123.—Do you think that the imposition of excise duties has affected adversely the development of industries producing excisable commodities e.g., their size and competitive capacity in export markets?

Excise duties, fixed only by reference to revenue considerations, are too high; use and consumption is correspondingly reduced and the development of industry retarded. So long as the excise is not to be borne by the article to be exported the limiting factor is the export duty or the efficiency of the industry or a combination of both.

Salt Duty.

Question 124.—Would you recommend the re-imposition of the excise duty on salt? If so, on what conditions?

Mahatma Gandhi's objections to the Salt Duty were

- it was not historically an Indian tax but it had been imposed by foreign rulers;
- it was regressive, bearing equally hardly on rich and poor;
- it was levied on a universal necessity.

A tax is not necessarily bad only by reason of its alien derivation; that may be said of other forms of taxation also.

It is true that its incidence was equally imposed on rich and poor. Where the burden of direct taxation is necessarily imposed on a very small section of the population the major part of the revenue must accrue from taxation in its indirect form. It is desirable that every subject should be made conscious of his responsibility to the State and to contribute so far as he can since otherwise the total burden is to be borne only by a few. The incidence of the tax on the individual, no matter how poor, can scarcely be described as oppressive.

Nor is a tax necessarily bad because it is levied on a commodity in general use or because it is unavoidable. On the other hand the duty on salt has the merit that it is particularly simple in its administration since the number of producers is limited and it is inexpensive in collection.

If the duty is re-imposed the recovery of salt should again become a monopoly of the Central Government. There is then assurance for complete control of prices and for the absence of scarcity which has appeared from time to time since the duty was abolished. The individual may be permitted to recover salt free of duty for his personal consumption. Salt for industrial purposes should be free of duty.

Taxes on the Sale & Purchase of Goods and on Advertisements.

Question 125.—Under the Constitution, the only sales or purchases which can be taxed are sales or purchases of goods. Do you consider that the sales tax should be extended to—

- services, so that the tax may be leviable on (a) charges for services proper (e.g., bills from a goldsmith or a printer), (b) charges for both services and goods where the two cannot be readily separated (e.g., hotel bills) and (c) charge for certain types of goods into the price of which service enters as a substantial element (e.g., paintings or photographs); and
- transactions of sale or purchase in stock exchanges and futures markets?

If so, please deal with the administrative and other issues which may arise in the implementation of your suggestions.

In no case should the Sales Tax be extended to services as such. Where the charge for service is a major ingredient of the selling price no Sales Tax should be imposed.

Transactions of sale or purchase in Stock Exchanges should not be subject to tax; transactions in commodity markets or futures markets should be taxed only when the transactions materialise in the transfer of property in goods.

Question 126.—(i) The Union alone has the power to levy a tax on sale of newspapers or on advertisements in them. This power has not, so far, been exercised. Would you propose as desirable and feasible (a) a tax on sales only, or (b) a tax on advertisements only, or (c) a tax on both?

As regards (a), it has been urged that, on account of the small price charged for each newspaper, the sales tax would be fractional and cannot be passed on to the buyers, whereas in the aggregate it would be an undue burden on the concern itself. If you agree with this, how would you meet the difficulty?

As regards (b), what classes, if any, of newspapers or advertisements would you exempt from the tax, and what rates of tax, graded or other, would you levy?

- Have you any suggestions to make regarding the taxation of advertisements other than those appearing in newspapers?

The selling price of a newspaper is generally thought to be less than its cost; the revenue is derived from advertisements of all kinds. A tax on the sale of a newspaper must be recovered through a higher charge for advertising and in effect would be a tax on advertisements. A tax on the dissemination of knowledge is in any event not desirable.

The cost of advertising is an ingredient in the cost of selling the article advertised. A tax on advertisements would therefore be a tax on the cost of selling. In so far as there is already a tax on the goods sold as a result of advertising there should be no tax on a sum spent in effecting the sale. The cost of advertising is included in the selling price of the merchandise; there should be no tax on the components of the price when the tax is levied on the whole.

The foregoing applies equally to other forms of advertising.

Question 127.—As regards sales tax generally and, in particular, the sales tax on goods leviable by the States, it is sometimes argued that—since all goods sold in a State must fall within one of three categories, viz., (a) manufactured or produced within the State, (b) transported into the State from elsewhere in the country and (c) imported into the State from abroad—an extension or increase of excise would serve just as well as sales tax for category (a), of octroi or terminal tax for category (b), and of customs for category (c). Do you agree with this view which implies that the sales tax has no specific function to perform in the country's system of taxation? If not, what in your opinion, from the point of view of a correlated tax-structure, is the legitimate place and scope of the sales tax as distinguished from that of excise, octroi and customs?

The Chamber agrees that the multiplicity of taxes should be reduced wherever possible. It would not, however, be administratively possible to collect an excise on all goods manufactured or produced in the State. Octroi and terminal taxes are a restraint on the free movement of trade and should be abolished rather than increased. The third suggestion can be practicable only in case the first and second are adopted and carried into effect. A properly constructed tax on the sale or purchase of goods is an appropriate means of raising revenue.

Question 128.—(a) Sales tax is almost invariably levied by the State Governments in terms of the turnover of the dealer over a given period. Since a sales tax leviable on the individual transactions necessitates fairly elaborate accounts, cash memos, etc., which only a small proportion of dealers is equipped to maintain, do you agree with the view that, in Indian conditions, the bulk of the sales tax is likely, for a long time to come, to continue to be leviable on aggregate turnover as distinguished from the individual sale-price?

- In most States there are separate laws governing sales tax on petrol. To what articles, if any, do you consider it desirable and feasible to extend the particular system adopted in respect of petrol?

While in present condition it is not easy to levy a tax on individual transactions, sales tax must necessarily be levied on the gross turnover. Regard should however be had for the fact that the imposition of sales tax liability only on a dealer whose gross turnover exceeds a certain limit, creates a certain amount of competitive disability for the registered dealer in relation to the unregistered dealer. The unregistered dealer may reasonably be required to pay a licence fee.

No extension is considered necessary.

Question 129.—(1) In regard to a system of levy based on turnover, is the choice broadly limited to the alternatives hereafter mentioned or is there any other system you would advocate? Under the system you recommend would sales tax continue to be roughly as significant a source of State revenue as at present? The alternatives referred to above are:

- a relatively low rate of levy at each of almost all points of sale; few dealers excluded and few goods exempted (Multi-Point);
- a relatively high rate of levy at only one point, viz., the point at which a registered dealer sells either to a consumer or to an unregistered dealer; exemption from tax of sales by one registered dealer to another registered dealer; exclusion from compulsory registration of a dealer below

a certain limit of turnover; a large number of exempted goods (Single point);

(iii) various combinations of the above.

(2) Which of the above alternatives would you advocate? Please state your reasons in some detail, comparing merits and demerits from the point of view of (a) the consumer, (b) the dealer, (c) industry, trade, etc., generally and (d) Government. Please relate your arguments, as far as possible, to lessons which may be drawn from the actual working of Sales Tax Acts in different States.

(3) In particular:

(i) as regards (a) above, do you think that the sales tax, or any particular form of it, leads to a greater burden being placed on the consumer than is accounted for by the proceeds which accrue to the Exchequer?

(ii) as regards (b) above, have you any suggestions to make regarding the simplification of forms, accounts, etc., and of the procedure generally in order to make the administration of the tax less burdensome to the dealer? Further, having regard to the cost of maintenance of the machinery for compliance, would you suggest an alternative form of taxation so far as small dealers are concerned?

(iii) as regards (c) above, has the imposition of the sales tax led to any noticeable change in the organisation of the trade in the country, especially in regard to the size of the business unit, location of head-offices, number of intermediaries, variety of the goods dealt with, etc.?

(iv) as regards (d) above, please examine the financial and administrative aspects, including the scope for evasion presented by the particular system and the difficulty or otherwise of counteracting it.

A multi-point system is inflationary and is not approved; the tax should be levied only at one point. The rate of tax may be different for different classes of articles according as different income groups are affected. What articles should be exempt from tax altogether is a question independent of the structure of the tax. Articles which are considered essential to the community and accordingly so notified by the Central Government should be completely exempted under State legislation although taxed by the State before the passing of the Central Act. It is again emphasised that the Sales Tax should not be imposed on any goods subject to an excise duty. The incidence of the tax should invariably be at the first point. A combination of the single point and multi-point systems is not approved. From considerations of tax evasion, it would be advantageous to reduce the points of incidence to the lowest possible number.

All raw materials and semi-processed articles which are bought by industrial consumers for purposes of manufacture should be exempt from sales tax at all stages as the cost of these materials will enter into the cost of the finished products which would eventually bear a sales tax on the total cost. On articles manufactured in India or manufactured abroad and imported into India, it is particularly important that the levy should be at the first point of sale.

The rate of tax must be co-related to the ability to pay. If the tax is levied at the first point only, the likelihood of evasion is less since the assesses will be fewer in number and of more substantial status.

The adoption of a single-point levy at the first stage will result in an economy of records and administration.

The diversity of Sales Tax systems throughout the Union has caused a very considerable confusion and the adoption of practices not in the best interests of the economy.

Question 130.—In relation to the particular system you advocate:

(i) should there be special rates of levy, higher than the ordinary rate, for certain articles? If so, for which types of articles?

(ii) should there be special rates of levy, lower than the ordinary rate, for certain articles? If so, for which types of articles?

(iii) which articles, if any, should be exempted altogether and why? Please elaborate the principles which, in your opinion, should underlie exemptions.

All articles declared by the Central Government as essential to the community should be totally exempt from the tax in all States. Other essentials should bear the lowest rate of duty. Semi-luxury should be taxed at higher rates and luxury goods at the highest rate. A tax on essential or near-essential articles such as soap, cloth, sugar, foot-wear and razor-blades would

add substantially to the cost of living of the bulk of the urban population who are bearing more than an equitable share of the taxes at present levied.

Question 131.—In regard to system, rates, exemptions, etc., what degree of uniformity between the different States do you consider desirable and feasible? Would you bring it about—

(i) by formal or informal convention;

(ii) by central legislation promoted at the instance of two or more States;

(iii) by constitutional amendment, so as to include certain basic matters connected with the sales tax in the Concurrent List;

(iv) by constitutional amendment, so as to include the item of sales tax, as a whole, in the Union List? In the last mentioned case how would you apportion the proceeds? Would this alternative be a practicable proposition from the point of view of the finances of the States?

A uniform system of tax should prevail throughout India. Provided essentials are exempted and near-essentials taxed at a lower rate, the rates of tax may also be uniform. A uniformity of system and of rates can only be achieved through Central legislation. The receipts from the tax should be distributed to the States according to their needs.

Question 132.—To what extent has any desirable uniformity been achieved in regard to exemptions (in favour of "goods essential for the life of the community")—under Clause (3) of Article 286 of the Constitution? What principles would you advocate for deciding the exemptions to be made under this provision of the Constitution? Do you consider that the scope of the provision contained in Clause (3) of Article 286 should be extended also to "essential articles" which had been subject to sales tax before the relevant central enactment came into force?

The goods which have been declared as essential under Article 286(3) of the Constitution have in fact been exempted from Sales Tax only to the extent that no additional imposition of tax is permitted without the consent of the President. The tax on these goods existing prior to the Central Government legislation of 1952 continue to be in force, and these taxes varied from State to State. The result is that no uniformity has been achieved. The proper course now is to repeal the taxes currently levied on these articles by the States.

The exemptions presently notified under Article 286(3) of the Constitution may be considered adequate if the rate of tax on near-essentials is as low as possible.

Question 133.—As regards 'sales outside the State', 'inter-State Commerce', etc., please discuss the adequacy or otherwise of the relevant provisions of Article 286 and suggest remedies for any defects which, in your opinion, have been revealed in the actual working of these provisions.

(b) Please discuss in this connection the desirability and feasibility of the suggestion that purchases only (and not sales) should be taxed, so that the tax jurisdiction of each State might be confined to parties residing within the State. Alternatively, do you consider that purchases should be taxed in certain cases and sales in certain others; if so, how and on what considerations would you define the two categories? In either case, please describe your scheme in some detail and explain the advantages which you claim for it.

The majority decision of the Supreme Court has converted, by legal fiction, a large number of transactions, which are essentially of an inter-State character, into intra-State trade subject to sales or purchase tax in the receiving State. As a result all States which have sales tax legislation have taken steps to collect sales tax from sellers outside their respective jurisdiction even in cases where such sellers have no place of business of their own or agent or manager within the taxing State. Consequently a dealer in a State trading with people in several other States is called upon to render accounts to those other States, to submit his books of account for scrutiny and to keep himself fully familiar with the changing regulation and rates in all States. This entails considerable harassment and wasteful expenditure to all such dealers and acts as a restraint on inter-State trade. Further, enforcement requires an elaborate machinery which cannot be wholly effective.

According to the Supreme Court decision, a transaction which is essentially of an inter-State nature becomes one of intra-State nature if, as a direct result of the sale, goods are delivered from State 'A' to State 'B' for consumption in State 'B'. Can the seller in State 'A' or the buyer in State 'B' declare at the time of their transaction *inter se* whether the goods are for consumption within State 'B'? The question can be

answered in the affirmative if the dealer in State 'B' is himself the consumer. However if the dealer in State 'B' is purchasing for purpose of resale, he would not be in a position to say that the goods would eventually be consumed in State 'B'. There are many cities and towns which, by their commercial and geographical position, serve as distribution centres for regions covering more than one State. Dealers in these cities and towns will not really be able to say at the time of their purchases of goods from other States what portion of these goods will be consumed eventually within the State and what portion will be re-exported by them to other States. In such cases are Government going to assume that all goods coming within the State are intended for consumption therein, whereas in fact they will not be so? Whether or not goods are going into consumption within a certain State can only be determined at the point of consumption and not earlier. It is logically wrong to determine the place of sale by what might ultimately happen to the goods after several other transactions. The place of sale must be determined by reference to the sale itself, not by reference to any subsequent transaction. There is also difficulty in interpreting the words "as a direct result of the sale".

The Chamber is of opinion that the Supreme Court decisions show that the provisions of Article 286 of the Constitution have given rise to even greater difficulties than were first envisaged. Sales Tax law must be simple and straightforward for ordinary dealers to understand and implement in their manifold day-to-day transactions. In the interests of simplicity, all transactions which are of an inter-State character should be treated as such; some of them should not be, by legal fiction, converted to intra-State transactions. The imposition of a Sales Tax levied at one and the first point only by the Central Government at uniform rates as recommended by the Chamber will resolve all of the difficulties, disadvantages and inequities implicit in the several questions asked by the Commission. The restraints on inter-State trade will abate in a condition in which there would be only one authority responsible for policy. The tax will be collected from a limited number of generally substantial persons, reducing problems of administration and evasion. The equitable distribution of the proceeds by the Centre will ensure a fair share to those States where by reason of the paucity of original sellers at the first point the revenue from the tax would otherwise be limited.

Question 134.—Do you think that lack of uniformity between the States as regards the rates of sales tax and the methods of applying it (single or multiple point) has the effect of raising barriers in inter-State commerce or of inducing uneconomic diversions of trade? If so, what measures would you suggest to rectify the position?

These questions are already answered.

State Excises.

Question 135.—(a) In regard to State excise duties and the revenue therefrom, have you any comments or suggestions to make—

(i) on features of importance connected with the system of levy of these duties in different States

or

(ii) on policies involving various degrees of relinquishment in certain States of the revenue from these duties?

Should there, in this context, be uniformity between different States? If so, in what particulars and to what extent?

(b) Is there proper co-ordination between the levy of Central excise on medicinal and toilet preparations containing alcohol, etc., and of State excise on alcoholic liquors? If not, what steps would you suggest to ensure adequate co-ordination?

In a condition in which it is not possible in the absence of revenue, to provide education and medical services to a large section of the population even on a minimum standard, a policy involving any degree of relinquishment of revenue from excise must be wrong. Such a policy puts in reverse the maxim attaching merit to doing the greatest good for the greatest number. However that may be, there should at the least be a uniformity of policy throughout the Union. The policy of prohibition cannot possibly be wholly enforced so long as the importing of alcoholic liquors from other States cannot altogether be prevented. If there can be no uniform policy, at the least practice should be uniform and the complexity of restrictions on the inter-State trade in alcoholic liquors removed by an equalisation of excise rates.

General.

Question 136.—Do you think there is a case for vesting in the administration the power to alter, by executive order, the rates of import duties, export duties and excise duties? If so, please indicate in

what circumstances and within what limits such power should be exercised?

There is no case for vesting the Administration with power to alter duties by executive order excepting only in very exceptional circumstances and then only at ministerial level subject to the sanction of Parliament taken at the first opportunity. It is thought that the dangers of the whole system of export duties is implicit in this question.

PART IV.—AGRICULTURAL INCOME-TAX, LAND REVENUE AND IRRIGATION RATES.

Question 139.—A few States levy agricultural income-tax, but in almost none is it among the more important sources of revenue; the progress of land reforms will further reduce its yield. Would you, in order to increase the yield from this tax on for other reasons (which may please be specified), make major modifications in the present system of taxation of agricultural income? If so, please indicate the modifications you would make?

Question 140.—In particular, do your suggestions involve—

(a) correlation, and if so, to what extent, of agricultural with non-agricultural income-tax;

(b) alteration, and if so, in what manner, of the levy of land revenue?

As regards (a), if the correlation suggested takes the form of the levy of a single tax on the total of non-agricultural and agricultural income, instead of the present separate Central and State taxes, please deal with the constitutional, administrative and other problems involved, including the apportioning of proceeds among State Governments. Alternatively, if the State Governments continue separately to levy a tax on agricultural income, but the rates of levy are based on the total of the two types of income, agricultural and non-agricultural, what are the specific problems which arise, and how would you deal with them?

As regards (b), please indicate the probable net effect of the suggested measures on the revenues of Government. What administrative or other issues are involved, and how would you deal with them?

With the progress of land reforms, the abolition of Zamindari and the break-up of large estates, agricultural income-tax is not likely to yield a return commensurate with the cost of assessment and collection unless correlated with non-agricultural income-tax. There is, however, no longer any valid argument for excluding agricultural income from the total income of any assessee provided it is possible to define agricultural income in a simple and equitable manner. One method of determining agricultural income for the purpose of income-tax is discussed under the next question. If income from agriculture so defined is to be included in the general income-tax return of the assessee and income-tax collected on the total income by the present income-tax organization, the non-agricultural income-tax ingredient could be apportioned between Central and State Governments according to the present arrangements for apportionment. It is not possible to assess the probable net effect of the suggested measures on the revenue of Government without a very detailed study of the land revenue records of all the State Governments.

Question 141.—How would you determine taxable income in the comparative absence of accounts in rural areas? What treatment should, in particular, be given to the following:

(i) expenses of cultivation, harvesting, preparation for the market, etc.;

(ii) agricultural losses owing to a calamity or other persons; (In this connection, would you favour giving the assessee the discretion to choose the alternative of averaging his income over a number of years—say 3 to 5 years—in order to cover good and bad years?);

(iii) depreciation in respect of—

(a) live stock,

(b) implements and carts,

(c) means of irrigation, e.g., wells, etc.,

(d) buildings?

The majority of agricultural holdings are so small that even the gross yield from their cultivation would fall well below the present exemption limit for income-tax. The number of assessees on the basis of agricultural income alone must be few, but there may be a considerable number already assessable to income-tax on the basis of non-agricultural income who also have some agricultural income which ought to bear the income-tax. Any method of determining taxable income earned from agricultural operations must fulfil two basic conditions:

(i) it should be possible to determine it on the basis of the existing revenue records;

- (ii) assessment should be related to the potential standard yield of land rather than on the actual yield from each particular plot of land.

If an attempt is made to assess the actual gross return from agricultural operations and to determine the net return after making allowances for expenses of cultivation, harvesting and preparation for the market, as well as for depreciation in respect of livestock, implements and wells, the cost of assessment will be out of all proportion to the expected yield. Further, as it will not be possible to exercise any close supervision in outlying rural areas, there will be far too great a scope for corruption and harassment. On the other hand, if it is possible to calculate the net agricultural return on the basis of the admissible rent that can be collected by a superior holder from an inferior holder (this is usually limited to so many times the land revenue assessment on the land), all the complications of making allowances for expenses are avoided. In most States there is a limit on the rent which the landlord or the superior holder can legally demand and collect from the peasant who actually cultivates the land. Such rent can be taken as a net return on the land, as generally all expenses of cultivation are borne by the actual cultivator. Where land is held in the name of the cultivator himself and no rent is, therefore, paid to a superior holder, the rent that could be demanded by the superior holder, if there were one, may be taken to be the net yield from agricultural operations.

The method suggested here is obviously very crude. If there is to be an aggregation of agricultural and non-agricultural income suitable adjustments will have to be made in every State, taking into consideration the local land revenue system and existing legislation for protection of tenants, under which limits are set to what a superior holder may legally demand from an inferior holder.

Question 142.—What rates would you prescribe for agricultural income tax and how would you graduate them? Is it possible to have uniform rates in all States? What exemption limits would lay down?

The aggregation of agricultural and non-agricultural income for assessment under the Income-tax Act is desirable and accordingly the question of separate rates or their graduation does not arise. Agricultural income would be included in the total assessable income and would automatically be subject to uniform rates in all States.

Question 143.—For areas already under or likely hereafter to be brought under ryotwari or similar tenures, do you consider that land revenue policy should be based on some form of periodical settlement?

If not, what alternative would you suggest? How would you work it? What would be its probable net effect on Government's revenues?

With the steady rise in the prices of agricultural produce over the last 14 years, land revenue is no longer a very heavy charge on the cultivator. In principle, however, it would not be equitable to ignore long-term changes in either the fertility of the land or in other factors like access to markets. There is, therefore, a case for periodical settlement. But with the decreasing importance of land revenue in the nation's budget, it is no longer necessary for such settlements to be as elaborate as the original settlements. Adjustments in the existing rates of revenue should be made only when there are major factors increasing or diminishing potential income of the farmer in the areas covered by such settlements.

Question 144.—If you are in favour of periodical settlements, what modifications, if any, would you make in the practices and principles which have been followed hitherto, and why? In your reply, please refer in particular to the following—

- (i) **Period of guarantee.**—Should this be shorter than in the past? Would you suggest longer periods in special circumstances, e.g., when ryotwari tenure is introduced for the first time?
- (ii) **Scope of guarantee.**—Should a fixed assessment be guaranteed for specific piece of land (or for a proprietary body, as for instance, in the Punjab)? Alternatively, should a basic rate be fixed and limits guaranteed within which it may vary? What factors would you take into account in varying the rate, e.g., area, nature of crop, yield, prices, etc.?
- (iii) **Basis of assessment.**—How should the basic rate be fixed? Would you introduce an element of progression?
- (iv) **Incentive to production.**—Would it be feasible so to regulate assessment as to provide an incentive for—
 - (a) larger agricultural production?

- (b) shifts in production, e.g., from cash crops to food crops or vice versa?

- (c) capital improvements to land?

- (v) **Payment in kind.**—Would it be possible to provide for payment in kind either partially or in full? Please discuss the advantages, difficulties, etc.

- (vi) **Uniformity between States.**—In the application of these principles what degree of uniformity between different States would be desirable and possible?

Question 145.—In regard to a re-settlement as distinguished from an original settlement, what additional principles, if any, would you suggest?

Account must be taken of existing settlements and principles of revenue collection in different States. It would be obviously impossible, politically, to effect any major changes to the detriment of the cultivator who has always regarded his land and everything associated with it as stable and constant. There is only a very limited scope for alterations and improvements in this connection and it is not possible to introduce any broad, general reasoning.

Question 146.—Where re-settlement is overdue but cannot yet, for administrative or other reasons, be undertaken, what transitional steps would you recommend in order to bring the old rates into conformity with changed conditions?

Would you levy a surcharge on the old rates, graduated if need be with reference to such factors as crop grown, size of holding, etc.?

How would you provide against the possibility of such a surcharge accentuating the disparity already present as a result of settlements of different areas having been undertaken at different times?

If the existing disparity is itself of a significant degree, what steps would you take to reduce it?

It would be politically unworkable to levy any surcharge on land revenue in the absence of resettlements. Where conditions have changed so materially as to result in a significant degree of disparity between neighbouring areas, a resettlement should be undertaken as expeditiously as possible. Short-term measures will be unworkable unless there is a proper resettlement.

Question 147.—Since a certain degree of disparity may be present—

- (i) between the pre-existing and the newly merged areas of a Part A State; or
- (ii) between the different units which have gone to form a Part B State;

What steps, if any, would you take, pending a general resettlement of such areas, towards removal or reduction of disparity?

The cultivator, in whatever State or area, considers his tenure and conditions of farming to be one of the most stable and constant factors in his environment. Any administrative action, in the absence of a resettlement, undertaken with a view to remove disparities between adjoining areas in Part "A" States and Part "B" States, will therefore be politically unworkable.

Question 151.—Are there any suggestions which you would make in regard to the assessment of—

- (i) agricultural land in rural areas, used for non-agricultural purposes;
- (ii) land classed as agricultural but now part of an urban area and used for non-agricultural purposes; and
- (iii) land classed as non-agricultural, whether in rural areas or in urban areas, and used for non-agricultural purposes?

It is now a recognised principle in most States that land used for non-agricultural purposes should bear a heavier revenue than land used for agricultural purposes. The equity of this principle has not been questioned seriously and it should be extended to all non-agricultural use regardless of the original classification of the land as agricultural or non-agricultural.

Irrigation Rates & Betterment Levy.

Question 155.—Would you recommend any of the following taxes, either singly or in combination, where a major irrigation work has been constructed by the State—

- (i) a betterment levy representing a portion of the increase in the value of land;
- (ii) an irrigation rate for the water actually supplied;
- (iii) a small compulsory cess for all lands under command whether the water is actually utilised or not;
- (iv) any other tax or taxes, as an alternative to or in conjunction with the above?

Where a major irrigation work has been constructed by the State, there is every justification for both a

betterment levy representing a portion of the increase in the value of the land, so long as that is imposed only upon a sale when the actual cash value of the betterment is determined, as well as an irrigation rate for the water actually supplied. There is also every justification for a small compulsory cess for all lands under command, as any landholder entitled to use water should contribute in some measure for its availability whether or not he chooses to make use of it. Such compulsory cess should however, be a very small charge by comparison with the irrigation rate for water actually supplied.

Question 156.—What portion of the increment in land value may be reasonably absorbed by the State as betterment levy?

How should it be assessed, in what instalments should it be collected and by what administrative machinery?

How would you time the recovery in relation to development, i.e., before the project comes into full operation or afterwards when substantial incremental value is actually realised?

Would it be proper and practicable to impose a betterment levy on lands already benefited by an existing irrigation work?

Should the proceeds from the levy be earmarked for a specific connected purpose, e.g., contributing towards the cost of the particular irrigation project or of other irrigation projects?

With so many alternative irrigation projects under consideration, landholders in areas fortunate enough to receive priority for construction should have no cause to complain if as much as 50 per cent. of the increased value of their lands is absorbed by the State by way of a betterment levy provided that the levy is collected only at the time of sale of holdings.

The provision of irrigation facilities makes such an enormous difference in the value of the land and the potential standard of living of the landholder that there is every justification for a betterment levy. The assessment and collection of the levy however, must present very serious administrative problems. The simplest method of collection might be one which comes into operation at the time of transfer of the improved land-holding by sale. It should be relatively easy to determine the difference between the value at the time of the last sale and sales effected after the provision of irrigation facilities. To some extent, this method can yield certain revenue even before a project comes into full operation as land values will appreciate in anticipation.

Further appreciation, that is appreciation after the first sale following on construction of the project, presents a more difficult problem; the same land should not be subjected to a second betterment levy unless it is possible to devise a method of assessing further automatic improvements in the value of holdings unconnected with the efforts of the landholder.

If the proposal to realise betterment levies by a charge at the time of registering subsequent sales of land is accepted, it will not be difficult to impose a betterment levy on lands already benefited by an existing irrigation work provided it is possible to estimate the standard improvement in land values in the area.

In no progressive system of taxation can receipts be directly linked with expenditure for specified purposes.

Question 157.—(i) Should the irrigation rate be no more than an adequate charge for the water supplied or should it also contain an element of additional levy on the increased yield or crops? Can you indicate with reference to conditions in your State whether, and if so to what extent, there is an element of additional levy in respect of (a) old irrigation works (b) new irrigation works? What limits would you place on the quantum of additional levy in respect of (a) old irrigation works (b) new irrigation works?

(ii) Would you base the irrigation rate primarily on (a) area irrigated, (b) quantity of water supplied, (c) crop value, (d) any other factor?

(iii) Are you in favour of periodical revision of water rates? If so, with reference to one or more specified States, what period would you consider appropriate in conformity with economic considerations and in the light of administrative convenience?

(iv) Do you advocate concessional or incentive rates particularly in the initial stages of development, with a view to encouraging the production of specific crops or the adoption of desired farming techniques?

The benefit normally derived from the provision of irrigation facilities is so great that there is every justification for inclusion in the irrigation rate of an element of additional levy on the increased yield of crops. The irrigation rate could, in fairness, be assessed so as to be in the same proportion to estimated value of the

standard yield as land revenue to estimated yield on unirrigated land.

The irrigation rate should be based primarily on the quantity of water supplied; the landholder who, by utilising a given quantity of water to better purpose, is able to secure a higher crop value than his neighbour should not be penalized.

Water rates once determined should not be revised too frequently. In general, the same consideration should determine the revision of water rates as determined resettlements affecting revision of land revenue.

It is not desirable to complicate assessment of water rates by introducing concessional or incentive rates for particular crops or farming techniques. The necessary incentive in this respect is best provided directly by offering a better price for specific crops and educating the farmer who will learn that a better economic return results from the use of improved techniques.

Question 158.—How would you fix the compulsory irrigation cess? Would you make it a small fee relatable to the annual cost of maintenance of the work?

Landholders are likely to accept compulsory irrigation cess more easily if they appreciate that it is related to the annual cost of maintenance of the work.

Question 159.—If the items mentioned above—betterment levy, irrigation rate and irrigation cess—were discussed in connection with a minor irrigation work, or a tube well scheme, to what extent would your replies have to be modified?

What has been said of betterment levy, irrigation rate and irrigation cess applies with equal force to minor irrigation works or tubewell schemes as the landholder benefits appreciably from investment by the State. He should, therefore, be prepared to contribute towards the cost of such work and towards extension of similar works to other less fortunate areas.

Question 160.—In what circumstances would a consolidated rate of land revenue—where the assessment includes an element of water rate—be preferable to a scheme of separate irrigation rates and cesses?

A consolidated rate of land revenue including an element of water rate is not practicable as it will not be possible to assure constant and adequate supply of water to every landholder in the area; the element of water rate must have some relation to the quantity of water supplied.

Question 161.—What is the scope for the imposition of a surcharge on irrigation rates based on—

- (i) crop values;
- (ii) sizes of holdings, etc.,

for the purpose of financing projects of a local character?

Land covered by irrigation schemes can obviously bear a higher local cess than dry lands. If local cess is to be determined as a proportion of land revenue, it will be only fair to assess local cess on irrigated lands after adding irrigation rates to the land revenue. If the local cess is based on annual value, irrigated land will automatically bear a higher cess as it will have a higher annual value than dry land.

PART V.—OTHER TAXES (Central and State).

Stamp Duties and Court Fees.

Question 162.—Under the constitution—

- (1) the Union is empowered to fix the rates of stamp duties in respect of bills of exchange, cheques, promissory notes, bills of lading, letters of credit, policies of insurance, transfer of shares, debentures, proxies and receipts, and
- (2) the States are empowered to fix the rates of all other stamp duties.

As regards both (1) and (2), have you any suggestions to make for the levy of a stamp duty where it is not already levied, or for an increase or decrease of the present rates where a stamp duty already exists? Please give reasons for your suggestions. Are there any general principles which you would propose for adoption in regard to the fixation of rates of stamp duties?

As regards (2), since the rates vary from State to State, what degree of uniformity do you consider desirable and feasible, and how do you propose to achieve it?

If possible, please estimate the net effect of your proposals on the revenues of States.

The present duties on commercial documents are high enough. The duty on cheques payable until 1927 was thought to impede the development of banking and was accordingly withdrawn. It is now more than ever important that the banking habit be encouraged

and money concentrated where it will be productively employed. The duty on cheques should accordingly not be re-imposed. As with other duties and taxes there should be uniformity throughout the Union if only for the sake of simplicity. The Stamp Act is a most complex piece of legislation.

Question 163.—*Certain States (e.g., Bombay) levy stamp duties on transactions in forward markets. What is your view regarding the complaint that these duties have tended to affect the business in these markets, particularly that of the middle class traders? If you consider that the levy of stamp duty on transactions in these markets is a suitable and potentially important means of securing revenue, what administrative and other measures would you suggest for the efficient collection of such duties? Alternatively, in place of stamp duties, would you suggest some other form of taxation of transactions in stock exchanges and futures markets? If so, please elaborate your suggestion.*

A contract for the ready purchase and sale of any commodity attracts no tax or duty of the kind contemplated by the question although there may be an increment to the price by way of Sales Tax. Any such tax or duty would operate as a restraint on the movement of commodities and on trade generally. So much can with equal force be said of the forward contract made as a form of insurance indispensable to all traders in or users of commodities. If it were possible to distinguish between the genuine hedge and the speculative contract the latter should be heavily taxed; but there seems to be no means of identifying the speculative contract excepting only that in shares in the case of which a speculative transaction may be presumed if there is no delivery.

Question 164.—*In this country, the stamp duty is ordinarily a tax on documents which constitute evidence of legal rights. There are, however, certain taxes, such as the entertainments tax, which are sometimes collected in the form of stamps, and suggestions have been made that this system may be appropriately extended to the collection of taxes on the sale of goods or on other transactions. Do you agree with this view? If so, to what taxes would you extend the scheme?*

The utmost economy in collection is desirable but it is extremely doubtful whether it would be practicable to substitute a stamp duty for the tax on a sale of goods in its present form if the facility for evasion is not thereby to be increased.

Question 165.—*What are the more common methods of evasion or avoidance of payment of stamp duty? What means of prevention would you suggest?*

There is a substantial loss in the revenue from stamp duties in a condition in which—

- the transmission of a share is possible without evidence of probate or letters of administration;
- it is the custom to hold shares on blank transfers;
- the stamp duty on a transfer of shares is paid by adhesive label.

It is commonly provided by Airticles of Association of companies that the directors may in their absolute discretion dispense with the production of probate or letters of administration or such other legal representation by the person claiming title to the shares of a deceased member of the company. There is substantial avoidance of probate duties as a result. It is important that the avoidance be checked. It may at the same time be noticed that avoidance of the probate duty will continue to be possible so long as the obligations proposed to be imposed by the Estate Duty Bill may be discharged without an application for probate or letters of administration. In the result there will be a diversion of revenue from the States to the Centre.

It is doubtful whether the practice of abstaining from securing the registration of shares has appreciably abated since the Bombay High Court held in *Shri Sakti Mills Ltd. v. Commissioner of Income-tax* (reported at 1948, I.T.R. 187) that credit under section 18(5) of the Income-tax Act for the tax paid by the company could be claimed only by the person registered as the holder of the shares. The payment of the stamp duties on the transfer is avoided if the shares are held under a deed of transfer executed only by the transferor to the extent that the property in the shares may pass through a number of hands without the registration of any transfer and it may be observed that certain banks customarily make advances upon the pledge of such shares without requiring their registration either in the name of the bank or in the name of pledger. No stock or share may be sold under sanction of the rules of the London Stock Exchange unless registered in the name of the vendor. There can be no escape from payment of the duties on the transfer. The enforcement of that rule is rendered practicable by arrangements for securing the completion of transfer within the shortest possi-

ble time believed to be 48 hours at the most. In India the time taken for the completion of a transfer of shares extends to three months or more. It may not be practicable in India to adopt the English law and practice; the evasion of the payment of stamp duties on transfers of stocks and shares may, however, be substantially abated if the banks are prohibited from making an advance upon the pledge of stocks or shares not registered in the name of the pledger or in the name of the bank or its nominees.

Even if cancelled as by an indelible rubber stamp at the time a transfer is approved the adhesive label by which the stamp duty on a transfer of shares is paid is easily removed and used a second time. The label does not carry the date of its issue as does the impressed label. It is believed that a substantial evasion of duty derives from the use of the adhesive label and that the revenue would advantage if the stamp duty on a transfer of share were to be paid by impressed label.

Question 166.—*The rates of court fees differ from State to State. To what extent do you consider uniformity in the rates desirable and feasible?*

Question 167.—*Have you any suggestions to make regarding the schedules to the Indian Court Fees Act and the rates of levy thereunder?*

Uniformity throughout the Union is certainly desirable.

Taxes on Motor and other Vehicles.

Question 168.—*Taking into account (a) the several taxes, Central, State and Local, which affect motor transport directly and business, trade, etc., indirectly, (b) the variation in some of these taxes from region to region and between different categories of vehicles, and (c) the relative financial needs of the different taxing authorities, both generally and, in particular, for the maintenance, improvement and extension of roads, what changes, if any, would you introduce in the present system of motor vehicles taxation? What degree of uniformity do your suggestions involve? Instead of several taxes by different authorities, a consolidated tax has been suggested: do you consider this feasible? How would you apportion the proceeds among the different authorities concerned?*

Taxes on vehicles are a tax on transport and are accordingly an indirect levy on the goods, commodities or persons taxed. The cost of transport including the taxes levied on it directly affect the cost of living, the health, the education and well-being of every one of the nation's crores of citizens.

The present inadequacy of transport facilities is a serious restraint on development and prevents the raising of living standards. In many regions road or rail transport is non-existent or roads are so poor that transportation costs are prohibitive. Production is accordingly equated to local consumption for want of cheap transport to consumers in other areas. The fishing industry, for example, is undeveloped because markets remote from the coast cannot be quickly reached; fruit is left to rot or is used as manure since there is no cheap and efficient transport to carry it to other parts of the sub-continent.

It is essential that all transport including motor transport and its taxation be placed under the direct control of the Central Government. The present condition in which there is a multiplicity of authorities should be changed and the right to impose taxation vested only at the Centre. Railways, air services and shipping are already so co-ordinated and controlled; they do not suffer a tax of the same character as the taxation on other forms of transport. Charges made by the docks and air-ports for facilities provided are not taxation according to any concept. Transport by motor vehicles being equally essential should have the same treatment. If the sole right to tax motor transport is vested in the Centre there will be complete uniformity.

A consolidated tax imposed at the Centre would present no unusual difficulties. The several States or municipalities could be made responsible for its collection and the preparation of the statistical data necessary for its allocation.

Question 169.—*To what extent and in what manner, in your view, should the proceeds from motor vehicles taxation be earmarked for road maintenance and development?*

The proceeds of a consolidated tax on motor vehicles levied at the Centre should be used in part as a subvention to the States, municipalities and other local authorities out of which to maintain roads within their jurisdiction not the responsibility of the Centre, and in part be appropriated to a non-lapsing road Fund to be expended on the construction and maintenance of roads over the whole country by a system of broad priorities. The need for a central organisation such as the Bureau of Public Roads in the U.S.A. or the Indian Railway Board is indicated. With it should be incor-

porated the Roads organisation of the Ministry of Transport. The construction of new roads cannot, however, be financed entirely from revenue but part of the cost must be financed by borrowings.

Question 170.—Have you any specific comments to make on the main recommendations of the Motor Vehicles Taxation Enquiry Committee, 1950?

The Chamber approves the rates of tax proposed by the Motor Vehicles Taxation Enquiry Committee, 1950 but is of opinion that its control and administration is better vested in the Union Government and further that—

(a) in the altered conditions in the automobile industry all motor vehicles and their components should be exempt from the Sales Tax;

(b) the fuel tax should be at a uniform rate of 6 annas per gallon of motor spirit on which there should be no Sales Tax.

Question 171.—Have you any suggestions to make regarding the extension of taxation to, or increase of present taxation on, users of roads other than motor vehicles? How would you classify the users, what rates would you suggest and who, in your view, should be the taxing authorities? How would you dispose of the proceeds?

All animal-drawn vehicles should be taxed subject to an abatement if fitted with rubber tyres. The tax would then be more appropriately described as a Roads Tax rather than a Motor Vehicles Tax.

Entertainments Tax.

Question 172.—This tax is usually levied on tickets of admission to entertainments or amusements, of which the cinema is by far the most important. In this regard, the Cinematograph Industry Enquiry Committee considered the incidence of the tax on the industry too heavy. Do you agree with this view and, in particular, do you consider that the rates have reached the point of diminishing returns?

The Committee also suggested uniformity in the rates of duty which differ widely from State to State. Do you agree with this view? If so, how should it be achieved?

How far would you apply graduation in the rates of entertainments tax?

What modification in the system of levy would you suggest?

The tax may be judged to be too heavy if in the result the cost of a desirable form of entertainment is beyond the means of a large section of the population and an important industry suffers or, from the revenue angle, the law of diminishing returns operates so as to reduce receipts. It is generally reported that the receipts from the tax have declined and accordingly there may be a presumption that the tax is too heavy.

A uniformity of charge throughout the Union is always, in principle, desirable. The tax should be graduated with exemption at the bottom of the scale. The present system of levy is considered satisfactory.

Question 173.—What principles would you adopt in regard to exemptions? Should the criterion be:

- (i) character of the entertainment (e.g., educational film);
- (ii) nature of object to which net receipts are applied, (e.g., charity show);
- (iii) class of persons admitted to entertainment (e.g., lowest class of ticket);
- (iv) any other factor?

The exhibition of educational films should be exempt.

Question 174.—How important is evasion of the entertainments tax and what methods of evasion are practiced? What steps would you take to minimise evasion? Should there be a restriction on the number or proportion of complimentary tickets issued? Should collection be more generally by stamps?

According to reliable information, evasion is not extensively practiced: the present system of inspection is adequate for its detection. The practice of allowing reputable exhibitors to pay weekly in arrears should continue.

Question 175.—Would you suggest the extension of the scope of application of the tax to any other organised and conveniently taxable forms of entertainment not taxed at present? Would you recommend the exclusion from the scope of the tax of any kind of entertainment which is taxed at present?

The Chamber has no comments.

Tax on the Consumption or Sale of Electricity.

Question 176.—A tax on the consumption or sale of electricity is levied in several States in India. Do you consider that this is a suitable tax and may be adopted by other States? Would you restrict it to consumers of energy for domestic purposes or would you extend it to sales for industrial uses also?

Electrical energy is pre-requisite to almost every form of productive activity and accordingly its generation and distribution is one of the major objectives of the Five-year Plan. A tax or duty imposed at its very source must operate as an impediment to productivity and should find no place in a healthy tax structure. The national income will increase in direct ratio as the employment of electrical energy in agriculture and industry; the State will advantage by the larger revenue from direct taxation in the form of income-tax and from indirect taxation on the increase in consumption resulting from improved living standards.

There is no better case for the tax or duty on electrical energy used for domestic purposes. It is both literally and figuratively a source of light and is an essential and important element in the modern standard of living. The tax discourages its universal application and tends to deny its benefits to persons not far removed from the subsistence level. It should be the policy of the State to make electrical energy as cheap as possible.

Question 177.—In respect of domestic purposes—

(a) should a distinction be drawn between the electrical energy consumed for light and fans and the energy consumed for other domestic purposes (frigidaires, heaters, radios, etc.)? On what principles would you determine the rates of duty?

(b) what exemptions would you suggest and on what basis? Would you apply a lower rate of duty to small consumers?

If at all a tax or duty is imposed on electrical energy used for domestic purposes no distinction is practicable between classes of domestic consumption without introducing the need for a separate and expensive wiring system. Any tax or duty should be levied as a percentage of the selling price, and applied without distinction as to the domestic use to which it is put.

Question 178.—If you are in favour of a duty on energy used for industrial purposes, on what principles would you determine the rates of duty? What exemptions would you provide for and on what basis?

The Chamber is opposed to any tax or duty on electrical energy for whatever purpose used. Any tax or duty imposed notwithstanding should not exceed the lowest rate of tax levied by the State upon the sale of an essential commodity and there should be an exemption in favour of any industry in which the cost of the energy exceeds 10 per cent. of the prime cost of production.

Question 179.—How would you modify your suggestions in reply to the foregoing questions if electrical energy—

(i) is entirely supplied by Government undertakings in a State,

(ii) is supplied by Government undertakings in some areas of a State, and private undertakings in other areas?

The objection is taken to a tax or duty on electrical energy primarily because it must operate as an impediment to productivity. That objection lies whether the energy is supplied by the State or by private enterprise.

Question 180.—What degree of uniformity as between different States would be desirable in regard to the levy of electricity duty? How would you achieve it?

Any tax or duty must be uniform throughout all States in the Union if the tax burden is to be equitably distributed and one industrial unit is not to be placed at an advantage over another merely by reason of its situation. Power to impose the tax or duty should vest in the Union, not in the State.

PART VI.—LOCAL TAXATION

In dealing with this part of the Questionnaire, the Chamber confines itself to a few observations on octroi and terminal taxes.

Article 301 of the Constitution provides that trade, commerce and intercourse throughout the territory of India shall be free. Do octroi and terminal taxes not in effect set up internal frontiers and create barriers to be opened to the passage of goods only upon payment? Their levy may not be 'ultra vires' the Constitution according to the letter of the law; but the good intentions of the Constitution-making body are at the least frustrated.

Any tax or duty which bears on the raw materials of industry or on goods carried by road merely by reason of their being so carried is bad for it increases the cost of production and of motor transport with consequent discouragement to road development.

In line with its proposals for a reduction in the

multiplicity of taxing authorities and for a uniformity of tax rates throughout the Union, the Chamber is of opinion that the authority to levy these taxes should be repealed and that local authorities be compensated for their loss by a subvention from a tax on consumption, viz., the Sales Tax.

VIEWS OF THE BOMBAY CHAMBER OF COMMERCE SUPPLEMENTARY TO THEIR REPLIES TO THE QUESTIONNAIRE OF THE TAXATION ENQUIRY COMMISSION.

Copy of letter, dated 8th October 1953 from Secretary of the Chamber to the Secretary Taxation Enquiry Commission.

"My Committee's submission made in reply to the Questionnaire is now in your hands. My Committee desire me, however, to direct your attention to these matters which they consider to be of particular importance, namely

- (a) the need for a reduction in the multiplicity of taxing authorities and a uniform system of taxation throughout the Union at equal rates;
- (b) the proposal made for the inclusion of agricultural income aggregately with other income under the Indian Income-tax Act;
- (c) the need for better definition of the status of the corporation-tax;
- (d) the significance of the frequency of questions put concerning the assessment and collection of income-tax;
- (e) the private company's status in the economy;
- (f) the administration's disregard of the procedure prescribed at section 30 of the Sea Customs Act and failure to create the arbitral machinery agreed to be set up under Article X of the General Agreement on Trade and Tariffs;
- (g) the proposal made for the re-imposition of the Salt Duty.

2. My Committee are not unmindful of the valid considerations for which the States were given so substantial a degree of autonomous government and so wide a field for the raising of revenue; nor are they unaware of the significance of any proposal for constitutional modification of the powers presently enjoyed by the States. The experience of trade and industry during the last few years, however, suggests urgent need for such modification and a larger vesting of control at the Centre so that not only the incidence of a tax but also the regulating statutory provisions are uniform throughout the Union.

3. My Committee believe the proposal to extend the scope of the Income-tax Act to agricultural incomes is generally approved and needs little emphasis.

4. Nothing has been done since the Todhunter Committee reported in 1925 to clarify the position of the corporation-tax. Its double incidence on the shareholder-corporation is a long-standing grievance which merits serious consideration. My Committee are of opinion that it would be logical to treat the corporation-tax as an additional duty of income-tax as it is described at section 55 of the Act and to credit it as tax paid on behalf of the shareholder after inclusion in his income. My Committee's views are set out at some length in the submissions made by way of reply to the questions put at Part II of the Questionnaire.

5. A significant feature of the Income-tax section of the Questionnaire is the emphasis on evasion, the recovery of arrears and, in perhaps less degree, the relations between the Department and the tax-payer and procedural delays.

6. My Committee will support any proposal designed to check evasion and to recover the tax so long as the liberty of the subject is not thereby endangered and the measure proposed does not carry with it increased opportunity for corruption. They observe, however that the Legislature has strengthened the administration in a number of ways during the last fourteen years. The period of limitation for the institution of an assessment or for re-assessment has been extended and the impediment implicit in the pre-requisite discovery of information removed; the scheme for advance payments and the power to make a provisional assessment has been introduced; the power of indirect recovery has been established; The power to make a summary assessment and to issue a demand payable within twenty-four hours has always been a feature of the statute. A number of the questions asked appear to suggest that the executive must have still more powers if the Act is to be effectively administered.

7. My Committee understand that some 26 crores of rupees of income-tax are in arrears; in addition sums due under assessments made by the Investigation Commission are to be recovered over a long period of years by an unwarranted liberality of instalments. According to the Department this unsatisfactory situation derives from a

shortage of executive staff. Persons closely associated with the work of the Department, however, observe with grave concern its reduced output attributable, in their opinion, to a growing deterioration and demoralisation of the administration. The Income-tax Officer is not always the sinister character he is reported to be but his future prospects may on the one hand depend upon the exercise of diligence to the point of harassment as evidenced by the assessment record and, on the other, upon an abstention from diligence in favour of a particular assessee at the instruction of his superior. In such a condition there can be no loyalty, no 'esprit de corps'. Government must enjoin upon the senior officials of the Department the need to observe an unimpeachable code of conduct in their relations with the public and should, in particular, express its disapproval in case there is a close association with persons of substantial means and ill-repute.

8. My Committee have noted with disapproval and some concern references recently made in a certain place to the private company; it has been said it is bogus, being in reality a partnership in disguise, and should be taxed as an association of persons. These references are apparently inspired by the default of a number of private companies whose assets have been alienated before income-tax assessments have been discharged; it is in any event to be seen whether action for assessment and recovery was taken in time.

9. In advanced countries, the private company is the rule, not the exception. In India, constitution as a partnership may be preferred, not always to avoid the charge of corporation-tax but frequently, with notable exceptions, because of the potential for evasion implicit in the unregistered partnership in a condition in which registration under the Partnership Act is permissive, not mandatory, and the power of assessment as a registered partnership can be exercised only if the partners are known.

10. The private company is frequently the public company in embryo and it derives from the facility with which a number of persons may join together for the promotion of a business or industrial enterprise. The members of such a company are no less entitled to the benefits of incorporation, including the development of capital through profit retention, than are the members of a company so entitled merely because of its larger membership.

11. The difficulties accruing from the disparities between the Customs Tariff and the Import Trade Control Schedule and official non-observance of the provisions of section 30 of the Sea Customs Act are in themselves serious enough. The absence of a quasi-judicial arbitral machinery for the resolving of disputes and the hearing of appeals is a matter of much concern; it is hoped the Commission will take particular notice of Government's failure to implement the provisions of Article X of GATT to which a reference is included in the submission made in reply to Question 112.

12. My Committee's submission throughout emphasises the importance of the indirect tax in a condition in which only so small a number are able to contribute directly to revenue. At one or more points attention is directed to the relative prosperity of labour, both urban and rural, and the poorer condition of the middle classes especially the lower middle class. Even the latter, however, are not so poor that they would be greatly affected by a re-imposition of the Salt-Duty. Only the very poor are likely to be affected but it is thought its incidence is not likely to be oppressive even on the poorest; in the alternative some means for the abatement of its incidence may be devised.

13. The Committee will look forward to the issue of your report with the keenest interest."

Copy of letter, dated 23rd September 1954, from the Secretary of the Bombay Chamber of Commerce to the Secretary, Taxation Enquiry Commission.

Commission's Note on "Sales Tax".

"When representatives of the Chamber gave oral evidence before the Commission on 8th February this year, the Chairman said he would send to the Chamber for its comments a note on "Sale Tax" containing certain tentative proposals to overcome the present difficulties experienced by non-resident dealers in the matter of inter-State Sales Tax.

Nothing further was heard from the Commission, but a copy of the Note sent by the Commission to the Bengal Chamber of Commerce was forwarded to this office by the Associated Chambers of Commerce, Calcutta. The Committee of the Chamber have considered this Note and they have the following comments to make on the proposals contained therein. The Committee hope that their views will be given due consideration by the Commission in formulating their final recommendations to Government.

At the outset I have been asked to make it clear that the Committee do not accept the lists of articles enumerated in the Commission's Scheme as exhaustive. These lists, have to be considered rather carefully, and I have been asked to emphasize that my Committee have not done so at this stage as they consider the whole Scheme to be far from practicable. The Committee's detailed comments on the Note are as under:—

Recommendation 1.—It is not clear from the recommendation whether the prohibition of imposition of Sales Tax would be only on the exporting State. In our view the articles enumerated in this recommendation are all essential to the life of the community and should be free from Sales Tax at any stage in any State.

It appears that the recommendation is only limited to prohibition of tax by the exporting State, as recommendation No. 6 deals with certain articles which should be free from all Sales Tax. As stated earlier, we are against a tax being levied on these articles even in the importing States. In fact, in most States these articles are even to day free from any Sales Tax.

Recommendation 2.—This recommendation implies that industrial raw materials will have to bear some Sales Tax although the total incidence of tax is sought to be limited by a ceiling. We reiterate the view set out in our memorandum to the Commission, viz., that raw materials should be entirely free of tax, for the reason that the finished products will be available for taxation.

Further, assuming that these articles have to bear some tax in the present context of National economy, it is not clear how the ceiling is going to be enforced without substantial Central intervention and regulation of the taxing machinery. If the ceiling is to be imposed, there has to be a statutory prohibition, which means amending the Constitution in a material manner. Moreover, goods of this kind on sale in any one province may have emanated from more than one State, each of which will have its own rates of tax. The tax levied in the receiving State will depend on how much has already been charged by the exporting States. This implies that the dealer in the receiving State will have to keep himself abreast of the rates of taxation in all the exporting States and will have to keep his accounts in such a manner as to show from what State he has received his stock. Further, these goods having once come into a particular State, will pass from the importing dealer to other dealers, and it will be extremely difficult to trace the origin of each lot. In short, if a ceiling has to be enforced, it can only be effectively done by limiting the imposition of tax to one stage. A multi-point tax system does not suit the proposal.

The proposal also implies that the same transaction may be subject to a tax in the exporting State and a tax in the importing State, which is against the spirit of Article 286 of the Constitution. Moreover, this does not solve the problem as to who is to pay the tax in the importing State, whether it should be the dealer in the exporting State, or the dealer or the consumer in the receiving State.

We therefore emphasise that insofar as Central intervention is inevitable under the proposed Scheme and the taxation structure envisaged is a single-point one, the tax might as well be levied by the Centre.

Recommendation 3.—This proposal also implies amendment of the Constitution—

- (a) so as to empower the exporting State to levy, a tax, and
- (b) to limit the power of the exporting State to a particular ceiling.

Further, it also implies Central Government intervention and the possibility of taxation of the same transaction in the exporting State and in the importing State. The problem of "who is to pay the tax in the importing State" still remains unresolved. If the exporting State, within whose jurisdiction the specified articles are manufactured, should be given some revenue, the proper way of doing that would be to give an allocation from the

Sales tax revenue on inter-State trade to be collected by the Central Government according to our proposal, at the rate of three pies in the rupee on goods exported from the manufacturing State. We are of the opinion that since largescale Central intervention and amendments of the Constitution are necessary, this might as well be done by the Centre to simplify the whole structure of taxation, leaving the question of allocation of revenue to the different States to be decided periodically by a suitable machinery.

Recommendation 4.—This proposal contemplates the exclusion of the enumerated articles from any tax in the exporting or importing States so far as inter-State movements are concerned. Further it also contemplates a single-point tax at the stage of sale to the consumer or, presumably, to the unregistered dealer. Once the desirability of a single-point tax is conceded in regard to a wide variety of articles classified as 'Luxury goods', there should be less reason for retaining a contrary structure, i.e., multi-point, in regard to articles of necessity. We therefore again stress that a single-point tax system is the most suitable and that, in any case, this system has the widest acceptance among the States.

This proposal also contemplates amendment of the Constitution so as to limit the power of the States to a particular ceiling.

Recommendation 5.—In the event of an export tax becoming permissible, we agree that such a tax should not be levied where there is no tax on internal consumption. However, as stated earlier, we are against the levy of an export tax by the exporting State.

Recommendation 6.—We do not think that the articles which should be free from all sales tax at all stages in any State should be limited to agricultural implements worked by human or animal power. As already stated with reference to our comment on Recommendation (1), there are many other articles which should receive the same treatment.

Recommendation 7.—We have already stated earlier that a multi-point tax system is not suitable.

General.—The Committee would like to draw the particular attention of the Commission to the fact that the Central Government have so far refrained from intervening in the rights of State Governments to administer their own sales tax laws in the best way suited to their financial requirements. The Scheme envisaged in the Commission's Note, however, cannot be implemented without substantial intervention by the Centre in the matter of fixing the suggested ceilings and amending the Constitution so as to empower the exporting State to levy a tax on the goods exported out of the State. In view of this, the Committee consider that the scheme would not find favour with the States and they would therefore, reiterate that the following proposals, which they have already submitted to the Commission in their Memorandum, should be given due consideration as being the next best alternative solution to the problem:—

- (1) Tax should be levied only at one point in any State;
- (2) This is best done at the first point;
- (3) Neither the exporting nor the importing State should have the right to levy sales tax on inter-State sales. Such tax becomes unnecessary as the goods will be available for taxation at one stage according to our recommendation, to the extent to which the inter-State sale is not directly to a consumer.
- (4) All manner of inter-State sales, whether they come within the purview of Article 286(1) (a) or 286(2), should be treated as forming one single category, which would be subject to Central control and no other. If it becomes imperative to levy tax on inter-State sales, the power to do so should vest exclusively with the Centre. In other words, Article 286(1) should be amended by eliminating clause (a) and the Explanation.
- (5) Goods which are declared as essential to the community under Article 286(3) of the Constitution should be free from not only future impositions of sales tax, but also from existing levies.
- (6) A uniform rate of tax may be prescribed in regard to certain articles. Under the system of Single-point tax recommended by us, it should be easy to implement such a ceiling."

HINDUSTAN CHAMBER OF COMMERCE, MADRAS

REPLIES TO THE QUESTIONNAIRE OF THE TAXATION ENQUIRY COMMISSION.

PART I.—THE TAX SYSTEM

GENERAL

Question 1.—The system of taxation should take note of the stage of economic development of the country and should be so designed as not to hinder the production of greater wealth and the maximisation of production. In any tax system foremost place and precedence should be given to the objective to provide incentives to work, to save and to invest. The taxation should leave a sufficient margin for savings and encourage its flow into investments and thereby increase the productive wealth of the country.

The Chamber is aware that the reduction in inequalities of income and wealth forms the aim of tax systems, in certain advanced countries. The importance and the place which have to be accorded to this objective depends upon the stage of economic growth of the country. In advanced economies this may be a socially desirable subsidiary objective.

There will be economic warrant for bringing about by taxation a change in the pattern of distribution if it will in no way damage economic efficiency but on the other hand will promote it.

In a country like ours whose national income is low and whose economy is yet to be developed such equalitarian objectives will mean no tangible economic significance.

The objectives of taxation to serve such purposes as to counter inflationary or deflationary tendencies or to improve the external balance of the economy are permissible subsidiary objectives.

Question 3.—Taxation in India has more often been an *ad hoc* growth and more than ability to pay the revenue exigencies have been an important factor.

Question 5.—The Chamber is aware that the proportion of tax revenue to the national income in India is small when compared to other countries. India is a country with a huge population who have no adequate means of livelihood with a proverbially low standard of living. The relative burden of taxation on the people in different countries cannot be considered apart from the stage of the economic development of the country, its national and *per capita* income and the services rendered by the State to the people in return for taxes levied. In our country where national income is low, a higher proportion of taxation to national income will impose on the people a greater burden than the one in a country which has a higher national *per capita* income. So, at present there is no scope for raising the proportion. Any raising of the proportion will injure consumption and production.

Question 7.—At present non-tax revenues are derived by the Government from such State Undertakings as Railways, Post Offices, and other Industrial Undertakings started recently by the Government. If non-tax revenues are to be increased it will imply that the State has to enter into industrial field by starting industries even in the private sector; thus it will mean the revision of the industrial policy of the Government.

However, in future, the State is likely to derive larger revenue from the new undertakings such as the Sindri Fertiliser, Machine Tools and Cable factories recently established. But it is felt that they are not likely to occupy a more important place.

Question 8.—We agree with the view that the receipts from particular taxes should not as a rule, be funded or earmarked for specific purposes.

Question 9.—It is desirable under certain conditions to levy cesses for such purposes, say for developing a particular industry, but the Chamber does not approve the levy of cess on a particular industry for the purpose of assisting a counterpart of the same industry. The Chamber have in their mind, the levy of the cess on mill cloth for the purpose of development of the handloom industry.

Question 10.—It is the view of the Chamber that it is not desirable for further extension of State undertakings. State undertakings should be treated as any other private company and as such should be liable to tax.

Question 11.—The net surplus earned by State undertakings should accrue to the general revenues. In the case of Railways, now the general revenues of the Government get a contribution of four per cent. on the outlay. Such State Commercial Undertakings should be placed on a par with private commercial undertakings and should also be made liable for the payment of income-

tax and other taxes. The surplus earned from such undertakings can also be used for the purpose of financing projects of development. In certain circumstances, the surplus can be invested in the particular undertaking concerned, for instance where there is very heavy rehabilitation to be made or great programme of development has to be undertaken.

Question 12.—*Incidence of taxation.*—In examining the incidence of taxation on various classes of people the three factors namely income, residence and occupation have to be taken in combination.

Question 13.—The burden of present tax system Central, State and Local is not fairly distributed among the various classes of the people and in different States. The burden of direct tax and tax on commodities fall more heavily upon the urban population. The various taxes on commodities in force in the State also account for the unfair distribution of the tax in different States.

Question 16.—The benefits accruing from public expenditure has to be taken into account in considering the burden of taxation. Any expenditure incurred for development, say irrigation or agriculture and social capital expenditure have bearing on the burden of taxation.

Question 18.—*Taxation and economic development.*—The Chamber is of the view that taxation should not be used for the purpose of finding additional resources to finance development of the country. Development finance has to be found by borrowing and by promoting greater production of wealth.

Question 19.—In maximising resources required for financing development, importance should be given to economy, rationalisation of expenditure and prevention of tax avoidance and tax evasion.

In the present context of the country's economic development the Chamber is of the view that there is no scope for higher rates of existing taxes.

(e) To find resources for development, it is not necessary for the State to enter into the business field. Even from the point of view of revenue to the State, it will not be profitable for the State to enter into this field for the purpose of finding finance from non-tax revenues. Undertakings by private enterprises will yield better revenue to the State.

Questions 20 and 21.—The appropriate tax relief will certainly give impetus to capital formation. Relief in the matter of taxation of companies and on individual incomes will make savings possible and help their flow in investment channels.

Question 23.—Partly out of the high cost of living and increase in taxation the saving capacity of the middle class has been very much impaired. Any tax relief accompanied by fall in the cost of living will certainly assist the growth of savings.

Question 25.—In advanced economies where the consumption standards are high, taxation can be used to restrict consumption and thus the funds made so available may be made to flow into investment channels. But the consumption standards of India being already very low any regulation of consumption standards will mean not only greater hardship on the people but also is likely to hit adversely demand and interturn production. So, it is not desirable to regulate consumption standards as a means of finding larger resources for development.

Question 26.—Multiplicity of taxes and their lack of uniformity from State to State affect the efficiency of the economy.

Taxes on commodities should at least in certain basic matters, be similar. With our Constitution having a federal structure to attain uniformity or complete rationalisation in tax structure may be difficult. Anyway by periodic meetings or conferences among States agreement could be evolved on certain basic issues relating to commodity taxes.

Questions 27, 28 and 29.—Tax policy can influence overall demand. The high taxation on commodities can check consumption and prevent the flow of funds in the production of such goods. By modifying taxation and by providing liberal concessions, say, by way of depreciation allowances by light or no taxation on returns from particular investments, inducement can be provided for desirable investment or promoting new ventures.

The Committee feel, however, that taxation by itself cannot carry far economic development. It has to be used in conjunction with other inducements.

Monetary policy by itself will not secure the desired investment. For planning economic development monetary policy and tax policies have to be co-ordinated. Taxation is a good instrument for redistribution of income and wealth so long it does not damage the primary objective of not hindering the production of further wealth.

Question 30.—The present tax system in India with its high rate of taxes on income and other tax on luxuries makes for reduction of inequalities of income and wealth.

Question 32.—In modern economic societies public expenditure has also a place in the matter of achieving greater measure of equality of income. When the State incurs expenditure in giving subsidies for food such expenditure has the effect of reducing inequality in incomes.

Question 34.—(a) and (b).—The Parliament of India has now passed a measure for the levy of Estate Duty in preference to duties in respect of succession to properties. Some States have already passed the necessary resolution agreeing to the inclusion of agricultural property in the Estates liable for duty.

(c) At present Stamp Duty is collected in respect of transaction in Stock Exchanges. Besides this, there is no possibility of levying any other tax.

(f) In the present state of the literacy of the country any tax on newspapers will not be advisable as the same would be passed to the consumer.

Question 35.—*Tax on capital.*—Already the country is faced with paucity of funds for development. It has to think of means to secure the necessary funds for financing the development of the country. In the circumstances there is absolutely no scope for the levy of a tax on capital in India. Any tax on capital will deplete capital resources and adversely affect even the little investment in the country and will ultimately affect the revenue of the State.

Salt duty.—The levy of salt duty is surrounded by political considerations. The salt duty was an old tax and if its levy is light, its incidence will also be negligible.

At present certain States levy tax on agricultural income. There is a scope for the levy of tax in the country. There should either be a surcharge on land revenue or income-tax on agricultural income.

Our country is yet to evolve social security measures. So any possibility for tax on social security has to be ruled out.

Modification of the policy of prohibition will be desirable in as much as the States will be obtaining increased revenue with which they can finance their development programmes. The modification of the policy is desirable at least until such time the country develops its resources.

Question 36.—It is feasible to levy a tax on unearned income on value of lands or other property. When land or other property has benefited from the projects constructed out of the revenues of the State it is desirable that they should also contribute to the Exchequer in as much as their increment in value is due to the projects undertaken at State expenses, but such a levy should be spread over a long period of time and its burden should be low enough to leave a margin of gain to the beneficiaries.

Question 37.—At the present stage of the economy of the country we cannot think of any other fresh source of taxation.

Question 40.—Taxation and inflationary and deflationary situations:—We cannot claim as much efficiency as in other countries for taxation as an instrument to meet deflationary and inflationary situations. But in such situations, it has its utility. India being a price economy, a change in taxation is not without its effect. If there is reduction in taxation and if it leads to lower cost, there is a tendency for consumption to expand.

If taxation is used for countering inflation by imposing new taxes or by increasing existing taxes it itself after certain point produces inflationary situations.

Question 41.—In countering inflationary or deflationary conditions in the economy first place should be given to indirect taxes.

A reduction in or abolition of indirect taxes will accelerate consumption and thus counteract deflationary tendencies. Levy of or increase in indirect taxes will act as a brake on consumption in inflationary conditions.

Among the indirect taxes first importance should be given to Sales-tax and Excise Duties.

Direct Taxes will, of course, only affect investments. So, changes in direct taxes come next.

Question 43.—Public expenditure can also moderate the forces of inflation and deflation.

In inflationary conditions except expenditure on profits which would enhance the productive capacity of the country, all other expenditure has to be avoided.

A well timed and appropriate public expenditure can mitigate the forces of deflation. But the manner in which

public expenditure is financed is also relevant. Public expenditure financed mostly out of taxation will not yield the desired results. Further in a country like India, certainly public expenditure in such basic investments as Irrigation, Power, Agriculture, etc., will be desirable to stimulate economic activity. But public expenditure calculated to increase investment in the public sector alone will not be effective in moderating deflationary forces. Investment in private sector has also to be stepped up to achieve results.

Question 44.—Tax changes for dealing with the effects of rising or falling prices on particular groups of taxpayers or sectors of the economy are desirable.

Question 45.—The present economic situation obtained today in India is that the forces of inflation have been overcome. Due to lack of purchasing power, there are signs of demand not catching up production.

Further it has been noticed that there is a fall in the level of employment.

To stimulate demand to absorb the production of the country it may be necessary to abolish certain levy on commodities.

The situation now demands that every incentive has to be provided for stimulating investment in the private sector. For the purpose re-orientation of the tax policy with a view to reduce the burden of direct taxation is also necessary.

PART II.—DIRECT TAXES

INCOME-TAX.

Question 48.—To assess to tax capital gains of industry is objectionable. The Committee understands that such a form of taxation does not exist in any country except in U. S. A., Levy of such taxes in a country like ours will prove detrimental to fresh activity. Capital for industries is usually drawn from the public who invest their savings in new enterprises in expectation of appreciation of their capital as the industries develop. If such appreciation in the value is taxed it will mean drying up of the sources from which new industries have to find their finance for establishment. Further it is common knowledge that the Government of India once sought to raise this tax and subsequently abandoned the same in view of its poor yield and of its unscientific nature.

Question 50.—Bonus Shares issued from reserves or profits should not be taxed. When Bonus Shares are issued by a Company from its profits for the purpose of capitalising or for investment in fresh machinery or assets, it does not involve any release by the Company of its assets. The Shareholder at best gets only a share but receives no money.

Question 52.—Dividend derived from agricultural companies by the Share-holders are now sought to be taxed. Dividends received from agricultural Companies should be placed on a par with the agricultural income and should be exempt from income-tax.

Questions 53 and 54.—Aggregation of agricultural and non-agricultural income by Central Act will be preferable. The yield should be appropriately assigned to the state from which taxes on agricultural income is collected.

If the above alternative is adopted, it would mean the amendment of the Constitution. But this will ensure a measure of uniformity all over the country.

The Chamber is of opinion that the Government of the States and the Union must come to an agreement by which the law relating to the agricultural income-tax and its administration are uniform, although the rates of tax may be allowed to be fixed by the States.

Question 56.—It is felt that provisions of the present Income-tax Act relating to the donations to Charitable and Religious Trusts are very stringent. If an Institution is endowed only for the benefit of any particular community there will be no exemption. There are, in the country, numerous endowments to Hindu Temples and other Religious Institutions meant for wholly for Hindus or for Muslims or Christians. These Institutions though they are endowed to benefit a particular religious community they yet benefit a large class of the public. So it is necessary that this scope of exemption should be widened and that all institutions though they might not have registered under any statute but which are founded for the promotion or development of religion, science, etc., should also be entitled to exemption.

Question 57.—Business profits of co-operative enterprises be charged to income-tax and super-tax. They should be treated as Companies. But Societies with profits less than a figure, say a lakh of rupees business profit may be exempted.

Question 64.—The personal income-tax law does not take note of the domestic responsibility of the assessee and not related to his ability to pay. So, personal and

family allowances should be provided by giving specific allowances for family and dependants. With regard to Joint Family such allowances should be granted at least to the adult male married members.

Question 66.—Rate Structure.—Yes. The Income-tax and Super Tax may be integrated wherever possible. The consolidation of income-tax and super-tax at least with respect to taxation of individuals would help the administration. This would enable the assessee to readily appreciate the tax liability. As the States have no share in Corporation Tax, it may not be possible to integrate the two with regard to companies.

Question 67.—Where a Hindu Joint Family consists of four or more persons, the minimum limit of exemption for income-tax and super-tax should at least be three times the exemption limit provided.

Question 68.—The distinction between earned and unearned income has to be maintained. The quantum relief has to be extended. It is felt that the present earned income relief is inadequate. This distinction between earned and unearned income should be extended upto the income of Rs. 50,000 that is the maximum now allowed for earned income relief should be raised to Rs. 10,000. It has been noticed that a differentiation is made in the matter of allowing earned income relief. For instance when an employee, say of Government goes on leave, in the matter of assessment, even for the leave salary drawn, he is granted earned income allowances. But such allowance is granted in a partner of a concern when he is away from the place of business.

Question 70.—A change is called for in the method of assessment of the Hindu Undivided Family. They should be treated as a registered partnership.

Question 71.—Exemption will be granted from income-tax in respect of voluntary surrender by managing agents of the whole or part of a managing agency commission if it is made *bonafide* in the interests of a company or of the shareholders.

Question 73.—The present law relating to determination of *bonafide* annual value of property and deduction allowed for it are not satisfactory. The basis of recovery of tax on national income is leading to anomalous results and the owners are called upon to pay tax to an extent not at all justified by the surplus income over expenditure. Full allowance should be granted for all such taxes paid in respect of Municipal Property Tax.

Question 74.—Carry-forward of losses.—Where a partnership ceases and any of the other partners continue the business, the carry-forward of loss, at least in respect of the share of the partners who continue the business should be allowed.

Question 75.—Advance payment of tax was introduced as a counter inflationary measure. There is no justification for continuance of the same. Anyway, it is felt that all the complications will be avoided if the suggestion made by the business community is accepted by the Government namely that the assessee may be called upon to pay the Income-tax on their estimated income along with the return.

If advance payment of tax on fifty per cent. of the estimated profits is made, there should be no penalty. Advance payment should carry interest from the date of payment to the date of provisional or regular assessment.

Question 76.—Enquiries by the Income-tax Officers should be limited to the particular subject of enquiry, but all roving enquiries should be avoided.

Question 78.—There is no necessity to vest powers in the Appellate Tribunal to enhance assessments.

Question 81.—Dividends received by a company from another company which itself has paid super-tax on its profits should not be assessed to Corporation Tax in the hands of the receiving company. Since the other company has paid tax, it amounts to double taxation if the receiving company is also taxed.

Under the budget for this year exemption from Corporation tax to dividends received by companies on their investments in specified industrial undertakings formed after 28th February of this year and to dividends received by them in respect of fresh capital issued by existing companies engaged in specified industries has been granted. The scope of the exemption granted is narrow and has to be made as wide as possible and extended to dividends received by companies from investments in other companies.

Question 85.—Industrial and commercial enterprises undertaken by the Central, State or Local Government should also be subject to income-tax.

Question 86.—Fees payable by assessee to Chartered Accountants may be made on a scheduler basis.

Question 87.—Assessee may either represent by himself or by his employee or by Chartered Accountants or

Legal Practitioners. No other class of persons to be recognised for representation before the Income-tax Office.

Question 89.—The perquisites given to employees (business undertakings) should not be subject to taxation.

Question 90.—The tax liability may be made a first charge.

Question 81.—Powers for search etc., should not be vested in the Income-tax Officers.

Question 94.—The present arrangements for recovery of Income-tax are adequate. No separate machinery is needed.

Question 95.—In the matter of collection of Income tax no distinction should be made between private limited companies and public limited companies.

Question 97.—In each circle there should be an office who should help assessee in the matter of filling up of forms and give them advice. There should be regular meetings between the Commissioners of Income-tax or Senior Officials and the Income-tax Practitioners and the assessee to exchange views on the administration of the Act.

Question 98.—Levy of penalties.—The principle that the ignorance of law is no excuse, should not be rigidly applied. First offence should be very leniently treated.

Appellate Assistant Commissioners should be placed under the Control of the Appellate Tribunal.

Recovery of tax.—There should be provision in the main Act itself vesting power in the Appellate authorities to stay recovery of the tax, penalty or interest pending the disposal of the appeal or reference to the extent to which such tax, penalty or interest is in dispute.

Question 99.—There should be no frequent transfer of officers. Before an officer proceeds on transfer he should complete the enquiry of the case which he dealt with. Whenever a loss is reported such cases are not taken up by the officers. This leads to delay.

Questions 101 and 102.—Death Duties.—Since now the Estate Duty Bill has been adopted by the Parliament. The limit of exemption from this tax has been fixed at Rs. 50,000 in respect of a share in Mitakshara Joint Hindu Family and Rs. 75,000 in other cases. The exemption limits have to be raised in view of the low purchasing power of the people and of the very much restricted nature of the item; not to be included in the estate for the purpose of this levy.

If the saving habit among the people is to be encouraged the limit of exemption of insurance policies has to be fixed somewhere in the neighbourhood of Rs. 25,000. Liberal provisions relating to rapid succession relief should be made especially in the initial years; and in view of the high rate of mortality in this country, at least for a minimum period of five years the same estate should not be liable to duty for a second time. The rates now proposed to be levied are likely to prove severe in its operation. So the initial rate should be at two and a half per cent. and the maximum at twenty-five per cent. in the initial years. There should be provision for an Appellate authority on the lines of the Income-Tax Appellate Tribunal to hear appeals against the decision of the Controller of Estates.

PART III.—COMMODITY TAXES (Central and States).

CUSTOMS.

Import Duties.

Question 110.—Under what circumstances should Customs Duties be used in preference to import quotas as a means of restricting imports?

Tariff Control should be used in preference to import quotas for the purpose of restricting imports when there is no inflation in the country and domestic production is adequate.

Further if for the development of industry it is felt necessary to restrict the quantum of imports, tariff control can achieve the purpose and can be used by the levy of import duties at appropriate levels.

Import quotas in preference to tariff control has to be employed when there is need to conserve foreign exchange resources.

Question 113.—Export duties: Under what circumstances, in your opinion should export duties be imposed?

Question 114.—What measures would you suggest to achieve greater flexibility in the rates of duties to accord with the changing conditions of export markets?

Question 115.—Would you suggest that the whole or a part of the receipt from certain export duties should be funded for financing schemes for promoting long range development of the export trade, subject to the obligations under G.A.T.T.?

The Chamber is of the view that generally export duties should not at all be levied. Even if a country has monopoly of a commodity when export duties are levied it makes the importing countries search for substitutes.

There may be occasions when export duties have to be levied to conserve domestic supplies of a commodity or raw-materials or with a view to earn foreign exchange or to absorb profits when internal prices are low compared to foreign prices.

Export duties once they are levied as experience has shown they have tendency to stick on and become rigid.

Question 116.—*Would you, in the interests of revenue or from any other point of view, recommend increased participation by the State in import and export trade? If so, what form do you think should such participation take?*

The Chamber is of the opinion that participation by the State in the export or import trade is not necessary for increasing revenue.

With the emergence of the buyers' market there will be keen competition in international markets. Under such a condition it will be necessary to make a systematic study of the market, the taste and the demands of the consumers. This task will require great adaptability, personal contact, initiative and quickness of decision. To this task the Chamber is of the view that State organisation which is bound by routine and rules and which has no personal interest will hardly be suited.

Question 124.—*Salt Duty.*—*Would you recommend the re-imposition of the excise duty on salt? If so, on what conditions?*

The abolition of salt duty has a political background. It cannot be said that removal of the levy has in any way eased the burden of taxation on the common man or cheapened the price of salt. The incidence of the tax is spread over a wide area and the burden on the consumer is very little. In view of this and in the context of the need of the State for additional resources the re-imposition of the levy will not be open to any serious objection.

Question 128.—*(a) Sales tax is almost invariably levied by the State Governments in terms of the turnover of the dealer over a given period. Since a sales-tax leviable on the individual transaction necessitates fairly elaborate accounts, cash memos, etc., which only a small proportion of dealers is equipped to maintain, do you agree with the view that, in Indian conditions, the bulk of the sales-tax is likely, for a long time to come, to continue to be leviable on aggregate turnover as distinguished from the individual sale-price?*

The Chamber is of the opinion that for some time to come the bulk of sales-tax should continue to be leviable on aggregate turnover.

Question 128.—*(b) In most States there are separate laws governing sales-tax on petrol. To what articles, if any, do you consider it desirable and feasible to extend the particular system adopted in respect of petrol?*

The Chamber is not for treating petrol separately and is of the view that there should be no separate laws governing separate commodities.

Question 129.—*(1) In regard to a system of levy based on turnover, is the choice broadly limited to the alternatives hereafter mentioned or is there any other system you would advocate? Under the system you recommend would sales-tax continue to be roughly as significant a source of State revenue as at present? The alternatives referred to above are:*

- (i) a relatively low rate of levy at each of almost all points of sale; few dealers excluded and few goods exempted (Multi-point);
- (ii) a relatively high rate of levy at only one point, viz., the point at which a registered dealer sells either to a consumer or to an unregistered dealer; exemption from tax of sales by one registered dealer to another registered dealer; exclusion from compulsory registration of a dealer below a certain limit of turnover; a large number of exempted goods (Single Point);
- (iii) various combinations of the above.

(2) Which of the above alternatives would you, advocate? Please state your reasons in some detail, comparing merits and demerits from the point of view of (a) the consumer, (b) the dealer, (c) industry, trade, etc., generally and (d) Government. Please relate your arguments, as far as possible, to lessons which may be drawn from the actual working of sales-tax Acts in different States.

(3) In particular:—

- (i) as regards (a) above, do you think that the sales-tax, or any particular form of it, leads to a greater burden being placed on the consumer than is accounted for by the proceeds which accrue to the Exchequer?

(ii) as regard (b) above, have you any suggestions to make regarding the simplification of forms, accounts etc., end of the procedure generally in order to make the administration of the tax less burdensome to the dealer? Further, having regard to the cost of maintenance of the machinery for compliances, would you suggest an alternative form of taxation so far as small dealers are concerned?

(iii) as regards (c) above, has the imposition of the sales-tax to any noticeable change in the organisation of the trade in the country, especially in regard to the size of the business unit, location of head-offices, number of intermediaries, variety of the goods dealt with etc.?

(iv) as regards (d) above, please examine the financial and administrative aspects, including the scope for evasion presented by the particular system and the difficulty or otherwise of counter acting it?

The Chamber is in favour of alternative No. (ii) for a single point tax. Sales-tax should be levied at one point that is at the point at which the registered dealer either sells to the consumer or to an unregistered dealer. There should be exemption from tax on sales by one registered dealer by another registered dealer. Dealers below a prescribed limit should be exempted. Dealers above that limit of turnover may be required to be registered.

Further sales-tax being a regressive tax it should carry liberal exemptions.

A single point tax has the merit of simplicity. It is easily understood both by the consumers and the dealers. A commodity has necessarily to change hands in the course of trade before ultimately it reaches the consumer. If every point in the course of trade is charged to sales-tax it adds to the cost of the consumer. Moreover, this has the effect of eliminating the intermediaries who have an economic function to perform. Small dealers are also eliminated and business tends to be concentrated. Manufacturers may dispense with traditional channels or selling agents or distributors and they themselves may prefer direct transaction with the consumer. From the point of view of the consumers, it is said that the elimination of the intermediaries as a result of multi point sales-tax will be to his advantage inasmuch as his cost of the article will be less. However, the Chamber feels that this advantage may result to the consumer when in a multi-point the rates are very low. In a single point the burden of tax on all the articles will be the same while in a multi-point it will vary according to the number of stages an article passes through. The number of stages an article has to pass through varies from article to article. In a multi-point tax, an article which goes through more stages will bear a heavier burden of the tax. In a single point tax the burden will be the same irrespective of the number of stages an article passes through.

Under the single point system of sales-tax the number of assesses will be less consequently the work of the sales-tax department will greatly be minimised and naturally the cost of administration and collection will be less.

From the standpoint of all concerned the Chamber thinks that a single point sales-tax will be a convenient and a preferable system to a multi-point system.

Question 130.—*In relation to the particular system you advocate:*

- (i) should there be special rates of levy, higher than the ordinary rate, for certain articles? If so, for which types of articles?
- (ii) should there be special rates of levy, lower than the ordinary rate, for certain articles? If so, for which types of articles?

Generally the Chamber is not for the different rates for different articles, but for articles of luxury there can be special rates of levy. In this connection it is important to stress the necessity for uniformity throughout the country in the matter of goods which are classified as luxuries and the rate of levy.

Differential rates are likely to direct trade from one regional to another.

Question 130.—*(iii) Which articles, if any, should be exempted altogether and why? Please elaborate the principles which, in your opinion, should underlie exemptions.*

Articles of essential consumption to the common man such as grains, pulses, fruits, condiments, edible oils, clothing, school text-books, fuel, matches and raw materials needed by the industries should be exempt from tax. The principles which should underlie exemption should be that no essential article of consumption to the common man and no basic and principal raw-materials required by the industry should be subject to tax. Further, goods which are subject to Central Excise Duty should also be exempt from sales-tax.

Question 131.—*In regard to system, rates, exemptions, etc., what degree of uniformity between the different States do you consider desirable and feasible? Would you bring it about—*

- (i) *by formal or informal convention;*
- (ii) *by central legislation promoted at the instance of two or more States;*
- (iii) *by constitutional amendment, so as to include certain basic matters connected with the sales-tax in the concurrent list?*
- (iv) *by constitutional amendment so as to include the item of sales-tax, as a whole, in the Union List? In the last mentioned case how would you apportion the proceeds? Would this alternative be a practicable proposition from the point of view of the finances of the States?*

While complete uniformity and inclusion of sales-tax as a whole in the Union list is desirable the Chamber feel that it cannot be hoped for or practicable in the present circumstances. At least in such basic matters as the basis of levy, rates, exempted goods and inter-State sales, uniformity has to be secured. Uniformity can be brought about by constitutional amendment or formal or informal convention.

Question 132.—*To what extent has any desirable uniformity been achieved in regard to exemptions (in favour of "goods essential for the life of the community") under Clause (3) of Article 286 of the Constitution? What principles would you advocate for deciding the exemptions to be made under this provision of the Constitution? Do you consider that the scope of the provision contained in Clause (3) of Articles 286 should be extended also to "essential articles" which had been subject to sales-tax before the relevant central enactment came into force?*

Article 286 in actual practice has not brought about any desirable measure of uniformity.

Clause 3 of the Article 286 regarding essential articles should also be extended to sales-tax legislation which were extended before the relevant Central Act came into force.

Question 133.—*As regards "sales outside the State", "inter-State commerce", etc., please discuss the adequacy or otherwise of the relevant provisions of Article 286 and suggest remedies for any defects which, in your opinion, have been revealed in the actual working of these provisions.*

(b) Please discuss in this connection the desirability and feasibility of the suggestion that purchases only (and

not sales) should be taxed, so that the tax jurisdiction of each State might be confined to parties residing within the State. Alternatively, do you consider that purchases should be taxed in certain cases and sales in certain others; if so, how and on what considerations would you define the two categories? In either case, please describe your scheme in some detail and explain the advantages which you claim for it.

Article 286 has been variously interpreted by the States. The expression inter-State trade has been the subject of divergent interpretation. Inter-State trade has been held to cover sales to another State for consumption in that State. If a purchaser in the second State sells to another dealer in a third State, it is said that this clause of the Article does not apply to such sales.

Further the recent Judgment of the Supreme Court has held that though the State from which the sale is made cannot subject such transactions to tax, the State in which the goods are delivered can levy a tax on such sale.

The Chamber is of the view that no tax on sales should be levied on goods passing out of a State's territory either to any other State in the Union or to a foreign place.

Further simplicity requires that the powers of the State in regard to exercise of the levy of sales-tax should be confined to its territorial limits and all inter-State transactions should be exempt from levy of sales-tax.

(b) Levy of purchase tax will certainly avoid these complications when confined to territorial limits of each State but even in such a system uniformity in the matter of levy and rates should be secured all over the country.

The Chamber is not for levy of purchase tax in certain cases and tax on sales in others. This will necessarily complicate and prove cumbersome to the trade.

Question 134.—*Do you think that lack of uniformity between the States as regards the rates of sales-tax and the methods of applying it (single or multiple point) has the effect of raising barriers in inter-State commerce or of inducing uneconomic diversions of trade? If so, what measures would you suggest to rectify the position.*

The Chamber thinks that lack of uniformity between the States as regards rates of sales-tax and the system of levy and exemption has affected free flow of trade in inter-State commerce. Uniformity in system at least in basic matters will be the only remedy.

THE INDIAN MERCHANTS' CHAMBER, BOMBAY.

REPLIES TO THE QUESTIONNAIRE OF THE TAXATION ENQUIRY COMMISSION.

INTRODUCTION

With the rapid spread of the democratic form of Government in the present century, particularly after the end of the first World War, the scope of Government activity in the economic and social spheres greatly increased all over the world. The concept of the place and position of Government in building up a Welfare State has resulted in the administrative machinery undertaking enlarged functions. As the administrative functions increased, it became necessary for governments everywhere to raise a larger volume of revenue from the public from year to year and various forms of taxation had to be devised for the purpose of defraying the normal recurring expenditure on administration, quite apart from the developmental expenditure which also became an increasingly recurring feature. Today, in some of the economically developed countries, the revenue collected by Government by means of taxation forms a substantial proportion of national income. In an under-developed country like India, the scope for raising revenue by taxation is necessarily restricted, as compared with that in the economically developed countries, particularly of the West. It is futile to point out the high proportion of national income which these countries contribute to the public exchequer and to suggest by implication that in India too taxation can yield similar returns.

When Government expenditure was small, it was comparatively easy to obtain the necessary revenue by means of a few simple taxes which did not produce much perceptible effect on the trend of economic activity. However, as the volume of expenditure went up, Government had to tap a variety of sources for collecting the required revenue and in the process gave twists and turns to the course of economic development. As the necessity of appropriating a substantial proportion of the national income to the Treasury increased, taxation, naturally, became an important instrument of Government's economic policy. Governments everywhere now frame their taxation proposals not only for meeting budgetary expenses, but also for helping the achievement of such general objectives of economic and social policy, including the maintenance of economic stability, by counteracting inflationary or deflationary pressure, and encouragement of incentives to work, save and invest. The primary objective of a sound taxation policy, however, remains the collection of adequate revenues in a manner which would not weaken the incentive to work and impair the springs of action. For, howsoever effective the taxation policy may be in assisting the achievement of social objectives, if it does not safeguard the incentive to work, save and invest, it would have adverse repercussions on the volume of production and in the long run the standard of living, instead of registering improvement, would go down.

Direct taxation in this country has already surpassed the point of maximum returns and even in respect of indirect taxation, taking into account the very low level of *per capita* income and the high cost of living, the margin available may not be considerable. Realising that the principal goal of economic policy, which the country has to pursue and which has been embodied in the Five-Year Plan, is increased production and realising also that private enterprise has been assigned an important role in the attainment of this goal, it is essential that Governments, both at the Centre and in the States, should explore all possible means of cutting down their expenditure, particularly on administration, so as to avoid the continuance of the present policy of excessive reliance on direct taxation which has resulted in curbing enthusiasm for increased or new efforts for expansion of activity in spheres of production. The

scope for pruning governmental expenditure, particularly on administration, should be more systematically investigated and in that context, the suggestions repeatedly made, that the obligations undertaken by Government in spheres of State trading and in regard to the working of the controls designed for the period of shortages are continuing burdens in the shape of expenditure of an avoidable character, assume added importance.

The needs of the exchequer will still be comparatively large in the context of the enlarged functions undertaken by Government and avenues would have to be found for meeting those needs mainly by a re-adjustment of the existing taxes, by achieving a greater spread in the burden and by slowing down the pace of progress of proposals for achievement of certain social objectives, however laudable ideologically involving a set-back in the budgetary equilibrium by the consequent increased expenditure or loss of revenue and also necessitating the imposition of unpopular taxes at steep levels.

Out of the total Indian population of about 357 million in the year 1951, only about eight lakhs of persons were liable to income-tax. The rates of direct tax in India, for some years past, have approximated, if not in some cases exceeded, the levels elsewhere, and as a result of this heavy direct taxation, large chunks of personal incomes have flowed into the Treasury. This levelling down process has drastically reduced the volume of savings and hindered the progress of economic activity. The cause of the present subdued tempo of business activity in the private sector may directly be traced to the cumulative effect of the high level of direct taxation in the post-war period. As increased production is the principal means of raising the general standard of living, the imposition of heavy direct taxes produces a boomerang effect.

It is in the light of this wider perspective of encouraging a continuous and speedy increase in production, which is the only solution to the present low standard of living in the country that the Committee of the Indian Merchants' Chamber have attempted to express their views in reply to the questionnaire issued by the Taxation Enquiry Commission. Stress has been laid on the vital importance of incentives in the system of taxation. Liberal tax concessions are lately marked features of budgetary policy in almost all the important countries. In fact, 'incentive budgets' are the order of the day. The latest news about substantial tax concessions comes from Australia. The tax concessions recently announced amount to £A118.4 million, a substantial sum for a country of Australia's size. "In all, wage and salary earners will benefit from an average cut of 12½ per cent. in income-tax; public companies will pay 6s. (instead of 7s.) in the £ on the first £5,000 of taxable income and 7s. (instead of 9s.) in the £ on the balance, while private companies will benefit from a cut of 1s. in the £ on each of their equivalent rates. Goods previously subject to sales tax of between 20 and 50 per cent. will now carry a flat duty of 16½ per cent. (less in some cases), entertainments tax will be abolished altogether, and rates of customs and excise on spirits will be reduced by 21s. a gallon. Differential rates of tax on income from property will be removed and the exemption limits for both estate duties and payroll tax will be raised." We are emphasizing the importance of incentives in the system of taxation not with the insular object of safeguarding the interest of any special class or community, but with a view to encouraging the growth of savings and capital formation for stimulating increased economic activity and thereby ensuring all-round progress.

PART I.—THE TAX SYSTEM

General

Question 1.—What in your opinion should be the objectives of a sound tax policy? What should be the place in such a policy of the following objectives?

- (a) reduction in inequalities of income and wealth;
- (b) encouragement of incentives to work, to save and to invest;
- (c) countering of inflationary and deflationary tendencies; and
- (d) maintenance of the external balance of the economy.

In what directions would you suggest modification of the Indian tax system, having regard to these objectives?

A sound tax system is recognised as an integral part of the larger economic policy, which has for its objectives maximisation of production, increasing opportunities for high and stable levels of employment, and raising the standard of living of the people in general. In a relatively backward economy like ours, where a large proportion of the community has a sub-normal standard of living, the economic policy—and therefore the tax policy—must concentrate on achieving an accelerated pace of development by a careful mobilisation

of all its resources. As pointed out by the Planning Commission, a larger early increase in consumption and a higher rate of capital formation cannot go together, and it, therefore, becomes necessary to maintain a judicious balance between requirements of consumption and capital formation. While on the one hand, the level of consumption is to be maintained at such a level as to provide the necessary market for production, at the same time it will have to be remembered that 'unless capital formation is stepped up substantially, India will have to go on living from hand to mouth and the rate of economic advance will be small'. In other words, the conflicting claims of the need for securing capital formation to the maximum extent and the sustained consumption must be so adjusted as to bring about an optimum rate of development. Besides the objectives stated in the Question, relative importance of which we discuss below, we would like to emphasize that a sound tax system should be fair in its incidence on all sections of the community and at the same time adequate to meet the needs and requirements of an expanding economy.

(b) In our opinion, in a backward economy, besides the primary object of raising the necessary resources for meeting the expenses of Government, highest priority must be assigned to the objective of encouragement of incentives to work, to save and to invest, so that the same may result in the creation of increased wealth and in the improvement of the general standard of living of the people. It is recognised on all hands that taxation in our country has reached a stage, where it is bound to have a retarding effect on savings and investment capacity of the public. In our view, the taxation policy needs to be so re-orientated as to create conditions favourable for stimulation of capital formation for increased economic and industrial activity in the country. In this context, the Planning Commission, while they have recognised the importance of allowing private enterprise to tackle the sector of industrial development, have not given adequate consideration to the conditions and pre-requisites of any such organised development in that sector. The present steeply progressive rates of direct taxes and various other imposts and burdens in the shape of indirect taxation have considerably undermined incentives to save and to invest. In this connection, we would like to invite reference to the point of view expressed by the Planning Commission that 'increased reliance should be placed on the building up of corporate savings and public investment rather than individual savings'. In our view, the emphasis is not fully justified, inasmuch as for a long time to come for purposes of industrial development reliance will have to be placed on private savings, and it would, therefore, be necessary to afford all necessary facilities to create an atmosphere favourable for private savings.

There is, in our opinion, a very strong case for reducing the level of taxation, which has been in force for over a decade now and which has proved to have definitely prevented not only industry from conserving its resources, but also made inroads into the capacities of individuals to save. Even in industrially advanced countries like the U.K. and the U.S.A., increasing attention is being paid to the damaging effects of a high level of taxation, and the present tax system is described as threatening to "strife initiative, expansion and ultimately jobs". The following observations in the May 1953 issue of the *Guarantee Survey* indicate the trend of informed opinion on the issue elsewhere:

"Individual incomes, especially those in the middle and higher brackets, are traditionally the principal source of the savings that normally supply the great bulk of the venture capital available to new business. Small savers are not usually in a position to assume broad risks, nor are the 'institutional' investors, that have become the principal custodians of small savings. The heavy tax rates on personal incomes in general and the almost confiscatory rates on the larger ones, leave relatively little surplus for investment in equity securities and little incentive to assume the risks that such investment necessarily involves. The situation is aggravated by the Estate taxes, which further weaken the incentive to risk-taking investment and tend to depress the market for equity securities, both by forcing liquidation and by breaking up estates into smaller units, for which such securities represent a less suitable form of investment."

In our country, the case is all the more strong for evolving a tax structure which provides positive measures of relief for achieving the objective of facilitating a continual flow of savings and capital formation. It is necessary to point out that vigorous and enduring economic expansion requires not only that adequate amounts of capital be available, but also that a sufficient proportion of the capital be of the risk-taking kind and it is a matter of common knowledge that 'risk' or 'venture' capital was not becoming sufficiently available for healthy business growth, and the situation unless rectified may result in industrial stagna-

tion, financial anaemia or both. It is, therefore, of the utmost importance that the tax policy must be reviewed and revised in terms of the major objective, viz., encouragement of incentives to work, to save and to invest.

Having stated what we consider to be the primary and major objective of a taxation policy, we will now refer to the remaining objectives which, according to us, are either incidental to a taxation policy or secondary in character. The question of maintaining the external balance of a given economy and the question of counteracting inflationary and deflationary tendencies vary according to the nature and stage of development of that economy and the given combination of circumstances which may prevail at the given time in that country.

(c) In any economy, conditions either of open or suppressed inflation, where too much money chases too few goods, spiralling up the prices, or deflation where the falling off of the monetary purchasing power leading to lowering of the standards of living and running to waste of the productive power, thus affecting the cost-price structure, productivity and employment, present numerous problems of serious magnitude and attempts are made with varying degrees of success to restore conditions of normalcy and stability. Under these conditions, the phenomenon of a bureaucratic apparatus of control for allocating supplies through rationing of scarce goods with the attendant evils of loss of personal freedom, threats to personal morality, costs of a swollen bureaucracy and clumsy inefficiencies of direct control, is too well known to be discussed here.

In industrially advanced and developed countries, attempts have been made to control inflationary and deflationary pressures through timing of public expenditure and of public investment, in particular, and through other fiscal and monetary measures. But the situation presents a problem of correct assessment and estimation of the multiplicity of economic forces at play and there is a great danger of misjudging the situation and overdoing in regard to regulating the operation of policies. It is very difficult to foretell inflationary or deflationary pressures at all accurately even for short periods ahead, and inflationary pressures may give place to deflationary pressures with quite unexpected rapidity. Budgetary policy in terms of surpluses or deficits is deemed to be one of such instruments of Control. In an under-developed country like ours, however, there is little scope for using the taxation policy for producing the desired results in terms of countering inflationary or deflationary pressures. As is well known in India, tax policy, both of the Central and the State Governments, affects only about 7 per cent. of the national income, whereas the proportion of the same to national income is as high as 35 per cent. in the U.K. This aspect imposes a serious limitation to taxation policy in influencing inflationary or deflationary tendencies in the economy to any appreciable extent. Besides, in the present context of high and progressive rates of direct taxation, there may be what we have described above the danger of overdoing and thereby defeating the very objective in view. In our opinion, in an under-developed country, the solution of the problem of inflation should not be sought in terms of reduction of effective demand or through a high level of taxation, which results in affecting savings and thereby productive investment. The correct approach should be through increase in productivity, both agricultural and industrial, which alone can reduce prices and remove conditions of disequilibrium.

(d) Similarly, in respect of the question of maintenance of the external balance of the economy, where either exports are in surplus or imports exceeds exports and either an inflationary or a deflationary situation is created, it is doubtful how far taxation policy by itself can help in correcting the situation in an economy like ours. While external conditions of emergency may require certain drastic remedies, generally speaking policies such as incentives to exports, quantitative import controls, with a view to safeguarding the indigenous industries and maintaining a balance and requisite tariff and exchange regulations are sufficient to meet the requirements of the situation.

(e) The Planning Commission have referred to the objective of reduction in inequalities of income and wealth, and in recent years a certain seductive attraction is attached to taxation as a method of achieving same. While the ideal of economic equality and social justice is unexceptionable, we maintain that in a backward economy, where the emphasis should be on increased economic activity and therefore on incentives to capital formation, there is a great danger of overdoing as a result of excessive zeal in favour of an egalitarian social order. Under the conditions where the mass of population are poor, except a small section, who serve as the reservoir to irrigate the dry fields of investment and where national production is low, due care should be taken to see that the presumption of economic inequality and the policy to correct the same do not result in levelling down still further the standard

of economic life in the country. It is necessary to remember that there are very definite limitations to Government effort and action to correct the supposed inequality in the distribution of incomes, before increasing the sources of income, if at the same time the productive effectiveness of the social and economic system is to be maintained. A dispassionate analysis of the figures relating to distribution of income under the different income groups will show that only 4 per cent. of the total population is liable to Income-tax and if the aggregate income of this section of the community is distributed equally among the sector constituting 99.75 per cent., there would not be any appreciable change in the general *per capita* level of income. The emphasis, in our opinion, on the reduction of inequality of income and wealth is misplaced at this juncture. For, reduction of inequality has necessarily to be attempted not by steps designed to level down a few but by a programme of action resulting in creating opportunities for raising and strengthening the position and lot of the rest. What is required is a concentration of efforts and steps which would stimulate increased economic and industrial activity in the country, leading to all-round increase in income of all sections of the society and with it the living standards of the people.

Having regard to the views expressed by us, we suggest the following modifications in the Indian tax system:—

- (1) The excessive reliance on direct taxation as the main source of governmental revenue should go and changes in the direction of broadening the basis of the tax system should be evolved.
- (2) Towards that end the existing rates structure for direct taxation should be subjected to radical modifications and possibilities of enlarging the yield from indirect taxes, particularly by levies on sections of the community which have not borne their due share under the existing structure should be gone into.
- (3) In the sphere of direct taxation:
 - (i) the progression in the rates structure should be adjusted in such a manner as not to destroy the element of personal initiative or incentive for expansion of activities;
 - (ii) the rates structure should be simplified by prescribing a composite rate, eliminating the present practice of two distinct levies in the shape of income-tax and super-tax;
 - (iii) the income level for the maximum rate of personal taxation should undergo a radical revision so that the residue of income available for disposal would afford incentives to save and to invest;
 - (iv) ploughing back of corporate profits should be increasingly stimulated by special reductions in the tax on undistributed profits of corporate undertakings;
 - (v) the ideas relating to economic concept of profit should undergo a revision so that a charge for financing of replacement of equipments in industrial undertakings would come to be accepted as an item of expenditure in calculating profits;
 - (vi) the basis of the grant of depreciation allowance on plant and machinery should be liberalised so as to assist the preservation of the productive capacity of industry;
 - (vii) ideas relating to the computation of income liable for taxation should be revised so as to take full account of the expenditure actually incurred for purposes of earning the income;
 - (viii) the basis of the other allowances deemed as admissible for computing income for tax liability should be liberalised; and
 - (ix) greater element of graduality should be introduced in the scheme of taxation of inherited wealth.

These are some of the more important changes which we have indicated in our replies and suggestions herein.

- (4) In the sphere of indirect taxation, the suggestions for changes have been discussed in dealing with the appropriate questions. The more important among them are:—
 - (i) the important tariff should be based on board considerations designed to secure adequate revenue, consistent with the need for assisting increased production in the country and avoiding undue burden on essentials of life;
 - (ii) the structure of our export tariff should be substantially modified so as not to prove to be a check on the flow of exports from the country;

- (iii) the possibilities of increased revenue through excise where increased or additional levy would not come in the way of the progress of the industry concerned, may be investigated;
 - (iv) the re-imposition of the excise duty on salt be considered; and
 - (v) the scheme of taxation on sale or purchase of goods be so rationalised as to conform to certain essential requirements so as to make the levy less vexatious, and as to secure in the process a degree of uniformity for the purpose of this levy all over the country.
- (5) Income from land should pay a greater share to the revenues of the States concerned and this should preferably be by an increase in the rates of land revenue than by the levy of agricultural income-tax and also by the levy of betterment charges, irrigation rates, etc.
 - (6) In the sphere of miscellaneous taxation, a number of suggestions have been made which are necessarily of a detailed character.

Questions 2, 3 & 4.—*What criteria would you suggest for determining the equity of a tax system? How far is it possible to secure it in the Indian tax system?*

Does the Indian tax system conform adequately to the principle of ability to pay or do you think an extension of this principle is desirable and practicable? If so, in what ways?

Differing views have been expressed on the extent to which the taxable capacity of various sections of the community has been used by the Indian tax system. What is your view on the subject?

As already pointed out, in our opinion, a sound tax system should be fair in its incidence on all sections of the community and at the same time adequate to meet the needs and requirements of an expanding economy. Such a tax system must be as broad-based as possible, spreading the field of taxation almost over the entire community, relating the amount of contribution of each individual to his capacity or ability to pay. The term 'equity of a tax system' is generally used with reference to the distribution of the tax burden among various important classes, income groups, rural and urban sectors, etc. A tax system, which seeks to approximate the pattern of taxation in terms of the principle of equity must be based on a fair degree of variety in taxes, thereby lending elasticity and flexibility to the tax system as a whole.

Examined from this point of view, in the Indian tax system, there is not only lack of proper balance between direct and indirect taxes, but the range of both direct and indirect taxes is narrow. There has been a tendency to exploit to an unwarranted extent income-tax amongst direct taxes and customs particularly export duties amongst indirect taxes, irrespective of the possible adverse effects of the same on the functioning of our economy as a whole. Taking direct taxation first, it may be pointed out that the structure of income-tax in the country is more or less the result of a haphazard growth and Government have resorted to the facile expedient of stepping up rates of direct taxation by either increasing the basic rates or by adding surcharges in terms of their revenue exigencies. Such arbitrary changes were neither the result of an expert investigation nor warranted by the capacity of those concerned to bear the effect and consequence of the burden. We feel that there is a strong case for a scientific overhaul and rationalisation of the whole tax structure.

It has been admitted by all that income-tax has been strained to the utmost, and the same was already being manifested in the depressing effects on the investment activities in the country. Taxes on income in the pre-war years represented less than 25 per cent. of the total tax revenue of the Central Exchequer. At the moment such tax income represents over 40 per cent. of the tax yield of the Centre. As will be seen, the burden of this form of taxation is not spread in an equitable manner. Out of a total population of about 36 crores, only 0.25 per cent. is called upon to bear a burden of the 45 per cent. of the total revenue of the Government at the Centre and the remaining 99.75 per cent. of the population does not pay any income-tax at all. Even in this sphere, the allocation of the tax burden is neither rational nor proportionate. The number of assesses with income over Rs. 1 lakh per annum represents .0013 per cent. of the total population and accounts for nearly 63.5 per cent. of the total income demand. The point is aptly illustrated when we remember that in the U.K. about 44 per cent. of the population pays income-tax in the U.S.A. about 37 per cent., in Australia about 34 per cent., and in Canada about 25 per cent.

It is further significant to note that the income level for the maximum rate of taxation is much lower in

India, as compared to countries like the U.K. and U.S.A. In India the maximum rate of tax applies to an income of over Rs. 1,50,000. The corresponding figure for U.S.A. is Rs. 9 lakhs and odd and for U.K., it is Rs. 2 lakhs. Further, the Indian tax-payer is placed in a less favourable position in respect of the residue of income available for disposal, after meeting taxation, as compared to the position obtaining elsewhere. On an assessed income of Rs. 5 lakhs, the balance available to an Indian assessee would be just over 24 per cent., whereas in Canada it would be over 43 per cent., in the U.S.A. over 51 per cent. This reinforces the point that, if the larger objective of savings with a view to assisting capital formation for the purpose of increased developmental efforts in the economy is to be achieved, the rate structure of direct taxation will have to be rationalised and made more broad-based. It becomes imperative to so adjust the fixation of maximum rate of income-tax and super-tax on individual incomes and the level at which maximum rate should be applicable, that the spreading of the burden is secured more justly and evenly.

In the absence of a thorough and scientific study into the question of incidence of taxation on various classes and groups in India, it is difficult to say with any degree of precision the relative capacity of various classes and groups to bear the burden of taxation. However, on the basis of such investigation as have been made and the rough calculations as are available, it would appear that during the past few years the incomes of the cultivator and the industrial worker have relatively increased, as compared to those persons belonging to what may be described as the middle class. The lower income groups, in absence of a better phrase known as the lower class population, which forms nearly 87.6 per cent. of the total population, contributes only 13.67 per cent. of the total tax revenues, while the upper of the middle class people, which forms 12.4 per cent., contributes as largely as 86.33 per cent. of the taxes. The agricultural sector of the economy enjoys complete immunity from income-tax in some States, and it is in the fitness of things that this sector must assume its due share of the responsibility in the scheme of allocation of burdens among various sections of the community. It is generally acknowledged that the burden of increased direct and indirect taxation has fallen in a disproportionate manner on the middle class than on the cultivators and industrial workers. This can hardly stand the test of the principle of ability to pay.

In the sphere of indirect taxes, excessive reliance has been placed on customs as a source of revenue and has been looked upon as the main plank of public finance. It is doubtful whether customs, particularly exports can be looked upon as a stable source of revenue supply, since the same is particularly liable to wide fluctuations, being largely dependent on the state of international trade. Reference must also be made to the increased dependence on export duties, which have been extended so as to cover a long range of important commodities. It is pertinent to note that in the year 1952-53, export duties yielded Rs. 55.5 crores out of a total of Rs. 177 crores from customs revenue. While there may be some justification for Government to claim a share out of the high export prices under exceptional market conditions, there is considerable risk attached to the policy of obtaining a large yield from export duties, inasmuch as the result is likely to be one of adverse effects on the export trade of the country as a whole. In fact, under the unstable conditions of international trade and prices, Government had to drastically revise a number of export duties recently either by cutting them down or abolishing some altogether. In short, export duties constitute a very doubtful weapon, particularly at a time when the world market is rapidly changing over from a sellers' to a buyers' market. It is in this context that we would like to urge the need for broadening of the tax base, so as to provide compensatory sources for achieving equity in taxation.

The Enquiry Commission will have to work out a well-conceived system of indirect taxation, so as to distribute the burden as fairly and equitably as possible, consistent with the object of raising the requisite revenues. It may not be out of place to refer here to some aspects of existing taxation policy, where the State Governments have voluntarily chosen to relinquish important sources of revenue on either sentimental or ideological grounds. The prohibition policy followed by some of the States and the discouragement to activities like horse racing, etc., are instances in point. The Commission will have to view this aspect from a rational point of view and suggest such changes or modifications as may be in the best economic interests of the country. The abolition of Salt Duty provides another example, where the Exchequer has lost a source of revenue without commensurate benefits to the consuming public.

Having indicated the necessary modifications in the existing taxation policy, we would like to urge that before thinking in terms of fresh avenues of taxation, the Enquiry Commission will have first to ascertain

how far the present increase in the level of public expenditure, which has compelled Government to bring about a corresponding increase in the level of taxation, is justified, both from the point of view of the results achieved and that of the need to maintain the level. We have drawn pointed attention on several occasions in the past that an analysis of the expenditure on revenue account of the Governments, both at the Centre and in the States, reveals the most significant increase in the sphere of administration and salaries. The increase in expenditure on account of salaries at the Centre is nearly 275 per cent. and the same in the States is of the magnitude of 300 per cent. Leaving aside the expenditure on National Defence, which has increased from Rs. 52 crores in the pre-war years to nearly Rs. 200 crores, it is significant to note that the expenditure on Internal Security, such as Police, Civil Defence, Jails, etc., both on account of the Central Government and the States, has gone up from Rs. 14 crores to nearly Rs. 50 crores. In the wake of the new concept of Social Welfare State, expenditure in the sphere of Social Welfare has gone up from Rs. 16 crores to Rs. 75 crores. While the need for gradual increases in the expenditure on nation-building and social welfare activities is generally accepted and appreciated, the question naturally arises as to whether the results achieved are comparable to the rate of increases. There is ground for the belief that revenue raised by increased or additional taxation is absorbed to a much greater extent in expenditure on administration and expenditure of a non-developmental or non-productive character. We, therefore, urge for a thorough review of the existing pattern of Public Expenditure, which in our opinion has an important bearing on the proposals for a re-adjustment of the present taxation system and structure.

Question 5.—*The proportion of tax revenue to national income in India is considered small relatively to several other countries. Do you think this proportion can be raised, and if so, what tax changes would you suggest for the purpose?*

As pointed out in the First Five-Year Plan, the tax revenues, both of the Central and the State Governments represent about 7 per cent. of the national income, and it is suggested that it is one of the lowest in the world. In support, it is pointed out that the proportion of tax revenue to national income is as high as 35 per cent. in the U.K., 22 per cent. in Australia, 23 per cent. in the United States and Japan, 27 per cent. in New Zealand and 19 per cent. in Canada. But as the Planning Commission themselves have admitted, too much should not be read into these comparisons, as yields from taxation depend not only on the facilities for collection but also in the absolute levels of *per capita* income. In order to place the whole problem in its correct perspective, it is essential to remember that India has a vast population to maintain and that her *per capita* national income is the lowest as compared to the countries referred to above. While the national income of Canada is slightly more than that of the Indian Union, her population represents only 1/20th of that of the Indian Union and, therefore, the *per capita* national income in terms of rupees is about Rs. 4,000. Likewise, the U.S.A. has a national income of nearly 21 times greater than that of India, while her population is 3/8ths that of the Indian Union. In an under-developed country like India, with a very low *per capita* national income, there would be relatively little scope for raising the proportion of tax revenues to national income by means of increases in taxation, as would be possible in an industrially advanced country, without seriously affecting savings and investment, production and employment.

Income-tax rates in India are sufficiently steep and progressive so as not to admit of any further increase. The only direction in which tax changes can be envisaged is spreading over the existing heavy burden of taxation, which covers a very narrow range of the population to the rest of the community, so as to make the whole system broad-based and equitable. Possibilities must also be explored in terms of shifting a little more burden in the sphere of indirect taxation. As pointed out above, there also exists a good scope for stepping up land taxation in terms of an upward revision of the tax on land. There is also a case for Betterment Levy, since the capacity of the agricultural sector is likely to improve as the programme of development gets into operation and results in bringing about agricultural prosperity of the rural sector.

Question 6.—*Do you think that the relative place of direct and indirect taxes in the Indian tax system is satisfactory?*

We are of the view that in the present tax system there is an undue emphasis on direct taxation as a source of revenue and that there is considerable force in the argument, as has been indicated above, for shifting the emphasis from direct to indirect taxes, so as to cover a wider range of the population and make the existing tax structure fair in its incidence and equitable in its distribution.

Question 7.—Do you consider that non-tax revenues are likely, in future, to occupy a more important place than hitherto in the public revenues of India? If so, please state the sources of non-tax revenue you have in view and indicate to what extent they may be expected to contribute to the public exchequer.

Taking the Budget year 1953-54 as basis, the total revenue expected to be raised in the Indian Union is of the magnitude of Rs. 905 crores, consisting of Rs. 439 crores to be raised by the Centre and Rs. 466 crores by the States. If the same is to be classified into tax and non-tax revenues, the revenues raised by way of taxes account for Rs. 683 crores as against the non-tax revenue from sources, such as forests, railways, posts and telegraphs, irrigation, currency and mint, registration and other licence fees, stamps, etc., to only Rs. 222 crores. If, therefore, the question seeks to suggest that there will be increasing yields in terms of revenues, from nationalised enterprises, including State trading, we are definitely of the view that Governmental ventures in the sphere of commerce and industry hold little promise for achieving the objective in view.

The experience of the working of the sectors which have already been nationalised either in the sphere of industry or trade goes to confirm the viewpoint that the machinery of the State is ill-equipped, lacks the necessary knowledge and experience essential for the successful operation of such activities. In the sphere of State trading, it is a moot point whether these activities have been conducted in a manner, which would be deemed to have been in the best interests of the country. In the matter of import of foodgrains, the heavy costs which the country had to bear in the shape of abnormally high prices, should be a sufficient deterrent for any further endeavours in that direction. Centralised arrangement through State agencies for bulk purchases on an exclusive basis is beset with the obvious disadvantage that opportunities for encouraging competitive terms on normal trade basis are lost. It is in the light of this experience that it is felt that if private trade agencies had been entrusted with the work of procuring these supplies, perhaps, the country would have obtained better terms and conditions. Another instance in point is the case of iron and steel, where the procedure adopted in obtaining supplies from foreign sources on a governmental level had caused the country a tremendous loss in the form of high prices. We are, therefore, of the definite view that any extension in the sphere of State trading is not likely to result in any substantial contribution to the Public Exchequer. On the contrary, such activities if undertaken may entail heavy losses to the country as a whole.

Question 8.—Do you agree with the view that receipts from particular taxes should not, as a rule, be funded or earmarked for specific purposes?

Question 9.—Do you think that it is desirable under certain conditions to levy cesses for special purposes?

It has been recognised as a sound principle of Public Finance not to fund or earmark for specific purposes receipts from particular taxes. It is a matter of common knowledge that principles governing the imposition of taxes have no direct co-relation with the principles underlying the distribution of the same amongst the various activities of the State. At the same time, there are certain cases, in which earmarking of such receipts for specific purposes has been deemed to be both desirable and advantageous. For example, the sugarcane cess, the cess on cotton, certain licence fees, etc., are meant for promoting certain specific activities, such as further research or providing marketing facilities and thereby promoting the development and regulation in a given case. However, it would be difficult to draw any rigid line of demarcation since Government are expected to undertake a number of activities whose benefits may accrue to a given industry, both directly or indirectly.

Question 10.—State undertakings, commercial, industrial, etc., are coming to play an increasingly important part in the economy of the country. Have you, from the point of view of their significance as a source of revenue, actual or potential, any comments or suggestions to make on matters, such as further extension of State undertakings and their policies in regard to pricing in so far as this may be relevant to tax policy?

Question 11.—Would you suggest that the net surplus earned by State undertakings should accrue to General Revenues or be carried to a Fund for financing projects of development or be re-invested in the undertakings concerned?

We have already indicated in our reply to Question 7 that it will not be desirable to have any extension in the sphere of either nationalised industries or State trading, as the same is not likely to result in any substantial contribution to the Public Exchequer. However, there has been a progressive extension of the sphere of State activities in the economic field in recent

years. Beginning with the postal and railway services and defence industries, the State has made incursions in a wider field, covering multi-purpose projects, manufacture of fertilizers, telephones and locomotives. It has not only confined itself to industrial enterprises but also extended itself to services such as State Transport, State Trading and Air Services. The scheme hitherto embodied in our system of taxation on income was conceived, when the trading activities were essentially concerned to be outside the scope of Government agencies; such commercial activities which were owned and conducted by the State for reasons of a national character were on that basis exempt from income-tax.

Railways represent one of the most important nationalised State activities, and although they were free from liability to taxation, this was partly made good by an obligation to pay a contribution out of the residual earnings to General Revenues. But in view of the altered conditions, a new re-orientation in the above outlook and treatment has become imperative. Whatever may be the organisational set-up that may be evolved for the State trading activities, the fact remains that in the process the resources of the State are employed in competition with the resources of the citizens. It is, therefore, in the fitness of things that conditions of such competition should be made as even and equal as possible. Otherwise, an anomalous situation would arise, whereunder State-owned undertakings would be exempt from taxation. This would be all the more glaring, when we realise that under the new Industrial Policy of the Government of India, in certain sectors industries owned by the State would be functioning and operating side by side with corresponding industries owned by private enterprise. Besides, the State is to be exclusively responsible for the establishment of new undertakings in the spheres of coal mining, manufacture of iron and steel, ship-building, production of mineral oils, etc., while the existing units in those spheres are to be allowed to continue under private ownership. We submit that all these activities should be treated on a directly commercial basis for purposes of tax liability and the present exemption from taxation should go. With direct taxation on joint-stock companies as large-scale industries are mostly owned by such companies continuing at the present high level, it would mean that the profit-making capacity of the private-owned unit would be indirectly sweated to the extent of 50 per cent. In the existing context of affairs, there can no longer be any justification for continuing the exemption of profits of business undertakings owned and conducted by the State from taxation. The same principles of paying a fixed rate of return on capital invested as also the net profits, after allowing for depreciation, being liable to taxation, should be applicable here also. In the event of any surplus being available after making adequate provision for reserve, same may be contributed to General Revenues. If the present inequity of the difference in standards of treatment for taxation purposes is allowed to continue, the same will lead to result of an undesirable character, like mounting overheads, inefficiency in Government-sponsored undertakings, and what is more, will give a distorted picture of the relative position as between public and private enterprise.

The success or failure of a public enterprise must be judged solely from the criterion of the standard of efficiency which implies in respect of every unit of production of goods and services the minimum cost and the requisite quality. Besides, there should be a proper system of cost accounting and quality control and the maintenance of proper commercial accounts, which should be periodically audited and made public. As to the pricing policy, it is essential that the community should know the cost not only in aggregate but the cost of each important part, so as to reveal the efficient working of each section of an enterprise. The same cost again should be real cost and if there is any element of subsidy by the State it should be added to the expenditure actually incurred. This equally applies to any element of hidden taxation in the price and that should be also clearly brought out. The crux of the policy should be that the price fixed for the product should be such as to enable the enterprise to "break even" for a period of years.

Incidence of Taxation.

Question 12.—In examining the incidence of taxation on various classes of people, which of the following factors, singly or in combination, would you suggest as the basis of differentiation—(a) Income, (b) Occupation, (c) Rural or urban residence? Is there any other basis, which may be considered?

Looking to the present system of Indian taxation with the enormous growths of tax revenues which began during the war and has continued in the post-war years, it is of great importance to study the question as to how the tax burden is distributed. Such inquiry will go a long way in formulating a correct taxation policy, fair and equitable in the burden it imposes on the various

classes of people in the community. Unfortunately, no comprehensive study has been undertaken on the subject, nor any relevant data is available for the purpose of such a study. In absence of such a study, the replies should be treated as indicative of the broad trends, subject to certain inherent limitations.

While income should generally be considered the main basis of differentiation, due importance will have to be attached to the occupational and rural or urban residence bases of differentiation as well. The study of incidence of taxation in India must imply a careful analysis of the change in shifts and the distribution of incomes and changes in the distribution of tax burden among different classes, as a result of the same.

Question 13.—Do you think that the burden of the present tax system, Central, State and Local, is fairly distributed among (a) various classes of people and (b) different States?

As already indicated above, during the past few years significant changes have taken place in the tax structure and shifts and distribution of incomes to such an extent that the present allocation of the tax burden cannot be considered as fair and equitable. While the burden of taxes on the higher income groups has been steep and progressive and is accepted to have reached the maximum taxable capacity, the medium-sized income groups have also been increasingly feeling the weight of taxation. It is also felt that there has been a greater diffusion of incomes in the non-income-tax-payment sectors, including the agricultural sector. This has resulted in enhancing the purchasing power of the low income groups and in the same manner the agricultural sector has also considerably benefited in the States where there is no agricultural income-tax in operation. In an equitable system of taxation, these classes, which have hitherto enjoyed immunity from taxation, must assume their due share of responsibility. The present system of taxation has naturally resulted in an uneven distribution among different States. States like Bombay, which have a high percentage of urban population consequent upon increased activity in the sphere of trade and industry, have to bear a much larger burden, as compared to other States with lesser industrial development.

The total *per capita* taxation of the Central Government for the whole country, according to Budget figures for the year 1952/53, is Rs. 12-4-6. People of the State of Bombay, however, are contributing a *per capita* Central taxation of Rs. 29. They are also contributing a *per capita* State taxation of a little over Rs. 10, as against Rs. 8-12-0 for West Bengal, Rs. 5-13-6 for U.P., Rs. 6-5-1 for Madras. There is again local taxation, i.e., tax levied by Municipal and other local bodies to the extent of a little over Rs. 5-8-0 per head in the State. In the aggregate, the *per capita* taxation, Central, State and Local in Bombay, comes to Rs. 44-9-6 and tax burden in this State is estimated to be about 75 per cent. in excess of the all-India average.

Question 14.—Have shifts in the distribution of income in the community in recent years altered the relative incidence of taxation on various classes of people? If so, to what extent?

Please refer to our replies to Questions 2, 3 and 4, as also to Question 13.

Question 15.—Do you think that the cost of compliance with tax regulations adds materially to the burden of taxation? If so, in respect of what taxes? Please give details.

The growing complexity of the various Tax regulations has added substantially to the burden of taxation. The requirements under the Income-tax and the Sales tax laws in particular have entailed elaborate systems of accounting and maintenance of books for meeting the requirements of tax assessments. This has imposed a very heavy burden on small traders and medium-sized industries. It is of the utmost importance that careful consideration should be given while introducing any tax changes to the point that compliance with the regulations does not involve an unduly large burden on the tax-payers.

Question 16.—Do the benefits accruing from public expenditure have a bearing on consideration of the burden of taxation? If so, how would you take this into account in considering the burden of Indian taxation?

In the hands of modern Governments, tax structure has become an effective instrument of policy along with public expenditure, and therefore it becomes necessary to strike a balance between the incidence of all taxes and the incidence of total expenditure. It is equally necessary to calculate the incidence of public expenditure, with a view to realising the benefits accruing from the public expenditure to various classes. Such a process will considerably help in co-relating the burden of taxation with benefits accruing from public expenditure and evolving a fair and just tax structure. Viewed from this point of view, there appears to be a fairly

sound case for a greater shift in the direction of indirect taxation as also the rural sector which is likely to derive a fairly large share of the benefits without corresponding liability to taxation.

Question 17.—Do you think that the tax burden weighs particularly heavy on any individual industry or occupation, and if so, please furnish the Commission with the evidence on which you rely.

Apart from the question of burden of taxation on industries in general, associations representing industries, such as cotton textiles, sugar, transport, etc., would be in a better position to provide the type of evidence in support of the contention that the tax burden weighs heavily on specific industries.

TAXATION & ECONOMIC DEVELOPMENT.

Question 18.—What role would you assign to taxation vis-a-vis various types of borrowing in finding the additional resources required for the development programme of the country?

The question of finding additional resources to implement the development programme of the country is an important one, and raises the question of alternative ways and means of finding the requisite resources. In order to be able to judge the question in its proper perspective, a brief reference may be made to the financial aspects of the development programme envisaged in the First Five-Year Plan. During the two years of the Plan in operation, the Central and the State Governments found approximately Rs. 363 crores towards the total outlay of Rs. 584 crores. The balance was accounted for by foreign loans and grants taken credit for and the sale of securities held in reserve and by withdrawals from the Central Government cash balances. It is further significant to note that, while the Central share of expenditure has been according to schedule, the performance on the part of the States has not been satisfactory. During the remaining 3 years of the Plan, programmes involving expenditure to the extent of Rs. 1,484 crores will have to be implemented. Out of this, not more than Rs. 600 crores is proposed to be realised from budgetary resources. Making due allowance for deficit financing to the extent of Rs. 215 crores expected to be provided for from Sterling Balances, there will still be a gap in the resources of the order of Rs. 600 crores, which will have to be met by additional taxation and borrowing, further external assistance and in the last resort by additional deficit financing.

As to the alternative suggested in the question, we believe that in view of the existing level of taxation and the numerous other burdens, it is clear that much cannot be expected through additional taxation, and apart from other alternatives such as external assistance, deficit financing, etc., increased reliance will have to be placed on borrowing. It is further pertinent to point out that it has been recently decided to increase the expenditure on the Five-Year Plan by Rs. 175 crores for financing new specific schemes, with a view to expanding the employment potential in the country. The problem of finding the additional finance, therefore, gains more in importance, and we would even venture to suggest that, if the choice is between spreading the period of the Plan and undergoing a period of austerity consequent upon additional burdens in the shape of increased or new taxes, we would express our choice in favour of the former.

The borrowing programmes of the Centre and of the States as envisaged in the Plan amount to Rs. 385 crores over 5 years. As indicated by the results of the recent State loans, with a well-conceived Plan of borrowing, creating the necessary climate in terms of offering suitable incentives for tapping the available supply of loanable funds, we feel that there is considerable scope for increasing the amount of State borrowing. There is also much scope for intensifying the small savings campaign and if properly tapped this can significantly augment the resources of the State. These efforts will be in conformity with the accepted view that developmental programmes of a productive nature should be largely financed by borrowing, instead of resorting to the method of obtaining revenue surplus by way of high oppressive taxation measures. All efforts must, therefore, be made in the direction of creating favourable conditions and offering such attractive rates of interest as would make it possible for the State and the Centre to obtain adequate loanable funds for their development programmes.

Question 19.—In maximising the resources required for the financing of development, what degree of importance would you assign to (a) economy and rationalisation in expenditure, (b) prevention of tax avoidance and tax evasion, (c) higher rates of existing taxes, (d) fresh taxes, and (e) development of non-tax revenues?

As pointed out in our reply to Questions 2, 3 and 4, first priority should be given to the aspect of economy and rationalisation in expenditure. There is a strong

case for a thorough review of the existing pattern of public expenditure, inasmuch as greater part of this is being absorbed by expenditure on administration and particularly expenditure of a non-developmental or non-productive character. Government have already shown serious concern over the inadequacy of the finance made available by the State Governments for the implementation of the Five-Year Plan, and have drawn pointed attention to the fact that in several States there have been increasing expenditure on non-development items. They have further urged for greater vigilance concerning proposals for expenditure on different kinds of administrative establishments, buildings, etc. Besides, the Planning Commission have deprecated the tendency on the part of States to take on hand development schemes not included in the Plan, despite their inability to raise additional resources thereby jeopardising the successful implementation of the Plan. In our view, except in the case of certain indirect taxes and betterment levies and increased land revenues, there is little scope for raising the necessary finances for development through higher rates of existing taxes or fresh taxes. We, therefore, place great emphasis on (a), *viz.*, need for economy and rationalisation in expenditure. In this connection, it is not out of place to emphasize the need for subjecting the existing expenditure on development projects to constant check and scrutiny, so as to avoid the possible dangers of waste, inefficiency, and corruption, invariably associated with the working of such projects.

Regarding (b), *viz.*, prevention of tax avoidance or tax evasion, we would like to urge a more positive approach in terms of remedying the causes which lead to such anti-social activities. It is a matter of common knowledge that excessive and penal rates of taxation are largely responsible for the temptation for avoidance or evasion of tax liability. It is, therefore, necessary that the tax structure should be made both reasonable and rational, so as to reduce or eliminate possibilities of evasion. This will also provide necessary incentives to increased production and consequent distribution, thereby creating incomes which would be liable to taxation. We have already referred elsewhere to the need for creating an atmosphere of helpfulness and co-operation on the part of the Income-tax authorities, so as to bring about better understanding and minimise possibilities of evasion. Attempt should also be made to eliminate the present administrative harassments to the public and a new reorientation in the attitude of Income-tax authorities towards the public is called for, with a view to promoting better relations between the Taxing authorities and the Tax-payer.

Question 20.—Under the Five-Year Plan, the public sector is expected to undertake a larger investment, an important place is also assigned to the private sector in the development programme. How would you devise a tax policy suitable to the development programme of the country in both sectors?

Question 21.—What part can tax policy play in stimulating capital formation in the private sector consistently with the needs of the public sector?

While in the assessment and allocation of resources envisaged in the First Five-Year Plan due provision has been made for financing the public sector, the private sector, which is expected to play its role in the development programmes, is expected to rely on its own resources. Also the responsibility for developing the private sector in the field of industry, except in regard to certain specified industries such as the integrated steel plant, industries for manufacturing heavy electrical equipments, fertilisers, etc., will mainly rest with private enterprise. While the role assigned to private enterprise in respect of industrial development is appreciated, it is felt that the Plan has not made any adequate provision for creating conditions conducive for the fulfilment of the responsibilities placed on the private sector. An investment of Rs. 233 crores is involved in the programme of development for the 42 organised industries in the private sector. In addition, industries have also to find resources for expenditure on replacement and modernisation to the extent of Rs. 155 crores, and if we add to this the need for additional investment in the shape of working capital, the balance required for the sector will be of the order of Rs. 533 crores. Having regard to the fact that the total investments in the first 2 years have come only to Rs. 60 crores, it is of the utmost importance to make necessary provision in terms of creating suitable climate for savings and capital formation for the private sector so as to enable it to play its role towards achieving the objects envisaged in the Plan.

In this context, it is necessary to remember that the rising cost structure and the diminishing margin of profit and the increased incidence of further burdens by way of additional taxation have considerably reduced the capacity of industries for providing resources necessary for various development schemes. It, therefore, reinforces the plea to so devise the tax policy as to provide the necessary scope for savings and invest-

ment so essential for the private sector to keep its pace with the public sector. Government through their taxation policy must provide facilities for private enterprise to increase corporate and personal savings and also give such direct assistance in the form of special concessions, such as higher initial depreciation allowances, etc., in cases where the profits are ploughed back for investment for expansion of existing or growth of new industries. The tax policy in our opinion can play a very significant and positive role in stimulating capital formation in the private sector. Government must bring about a reorientation in the tax policy, so as to release forces which encourage and promote personal and corporate savings and consequently capital formation, which alone can make industrial development possible by assuring a normal and regular flow of capital. It may not be out of place to refer here to the remarkable industrial development which has taken place in Puerto Rico as a typical case of backward economy. Government in spite of the system of mixed economy have formulated a special "Aids-to-industry" programme whereby complete exemption from income-tax, property tax, and municipal licence taxes has been granted to new industries and certain old industries. Such tax incentives and exemptions have proved to be an effective instrument for industrialisation. We are of the opinion that development in private sector fostered in this manner will be supplementary to the expansion achieved in the public sector and will go a long way in providing increasing employment opportunities, fulfilling the overall economic expansion and the consequent raising of the standard of living of the people.

Question 22.—(i) Is there evidence for the view that the rate of private capital formation in the community has been lower in the last few years as compared to the pre-war period? What factors, in your opinion, account for decline?

(ii) Has there been a shift in recent years in the sources of capital formation in the private sector as between individuals, corporations and other institutions?

(i) There is no reliable data available for the rate of private capital formation either in the pre-war period or for the post-war years. However, it could definitely be stated that, whatever quantum of capital formation is possible in the post-war years, is considerably lower, relative to the requirements of the industries, and in cases it is not even sufficient for maintenance of existing capital. This is confirmed by the Report of the Fiscal Commission, when they state that "there can be no doubt about post-war trends in general—that the rate of capital formation has declined". In an under-developed country with a sub-marginal living standard for a larger sector of the population and where joint stock enterprise has not developed, savings are to be drawn from a small proportion of the population, *viz.*, those engaged in industry, trade, commerce or profession. This basic fact has been often ignored in calculating the damaging effects of a high tax structure on savings of this sector, on which the country has mainly to depend for capital formation. Amongst the important factors, which operate as a check on the process of capital formation, may be mentioned the high incidence of direct taxation, existing Income-tax regulations, which do not make adequate provision for depreciation and maintenance of capital, inadequate credit facilities for the smaller and medium-scale businessmen, restrictive regulation and control on commerce and industries and unrealistic policies in respect of price fixation, bonus awards, etc. It is in this context that it is felt that the tax structure today is inequitable and as judged from canons of equity, simplicity, etc., strikes at the very foundations for planning of industry by drying up the springs of savings. It may be relevant to quote here a well-known observation that "tax legislation which impedes, discourages or retards capital formation consumes the seed-corn of our economic life".

(ii) As has been pointed out elsewhere, there has been a shift in recent years in the sources of capital formation and it may be generally observed that the shift has taken place in favour of corporate savings and other financial institutions. The individuals, who constituted hitherto an important source of savings, are no longer in a position to play their traditional role on account of both increased direct taxation and indirect taxes and levies, which the Governments at the Centre and in the States have imposed from time to time. The position of the middle-class, and the lower middle-class, who have been particular victims of this can be more aptly described in the words of Prof. C. N. Vakil, "The euthanasia of the middle-classes, which is being gradually brought about, thanks to the continuance of the period of high prices and of low fixed incomes, does not augur well for the economic development of the country..... It is widely believed that the re-distribution of income that has taken place during the war and the post-war period has not benefited the middle-classes, who formerly provided the sheet-anchor for the borrowing programme of Government and private enterprise. What is not equally widely realised is that the

taxation policy of both the Centre as well as the State Governments has been excessively burdensome on these classes and the cost of the various social amelioration measures undertaken by the Governments has been largely borne by them through sales taxes and higher prices."

Question 23.—Do you think that tax relief in respect of persons in the middle-income group would assist the growth of savings or mainly promote consumption?

In view of what is stated above, tax relief to the middle-income group will result in a major part of it being saved. Only a part of it is likely to be utilised for maintaining their customary standard of living.

Question 24.—The Planning Commission have given an estimate of the rate of progress in regard to national income and consumption standards on the assumption of 50 per cent. of the additional output going into investment each year after 1956-57. What measures in the field of taxation are necessary if this assumption is to be realised?

At the outset, it must be pointed out that the available data for an analysis of output and consumption requirements by different sectors of the community is very meagre and there is no scientific analysis available, except scattered information on which the assumption is based. We believe that the target of saving arrived at by the Planning Commission as a difference between larger output and lower consumption requirements is on the high side, having regard to the fact that the vast majority of the people are already living on sub-marginal subsistence level. Any further inroads into the consumption standards would mean considerable hardship, affecting the efficiency of the people. The State is expected through fiscal and other measures to regulate consumption standards within limits and thereby increase resources for investment. This enlargement of public savings has to be achieved through taxation and through the earnings of public enterprise as one of the major means. We have already indicated above that there is a limited scope for both from the point of view of creating increased resources in the existing conditions, and in that context the need for curtailing expenditure and making the existing tax structure as broad-based as possible, so as to make available as large a proportion of savings for purposes of re-investment.

Question 25.—Do you accept the view that some regulation of consumption standards is desirable as a means of releasing larger resources for development? If so, what part, in your view, can tax policy play in this process and what should be the relative role of direct and indirect taxes in achieving the purpose?

In a backward economy with a very low standard of living for the vast majority of the population, there is little scope for lowering the present consumption standards with a view to realising larger resources for development. Nor can any significant results be achieved through regulation of consumption standards of the small section of the people in the upper income groups, in this direction. In the present context, there is little scope for increase in direct taxation, and direct taxes can but play a limited role in reduction of consumption.

Question 26.—How far can tax policy help to promote the efficiency of the productive system? Do you think that multiplicity of taxes in India in respect of the same commodities and their lack of uniformity from State to State affect the allocation of resources in the community and hence the efficiency of the economy? Have you any suggestions for the rationalisation of the country's tax structure in these respects?

The tax policy can help promoting the efficiency of the productive system, firstly by providing suitable reliefs with a view to encouraging replacement and renewal of plants, and secondly by minimum interference in the smooth working of the competitive economy through free inter-play of price mechanism and economic forces. Multiplicity of taxes in respect of some commodities and lack of uniformity in regard to the same from State to State very seriously affect the allocation of resources and consequently the efficiency of the economy of the country as a whole. Reference may be made here to the different systems of sales tax operating in the country from single-point to multiple-points, resulting in displacement of normal trade channels and diversion of trade and commerce. The existing systems of sales tax in the country, which completely lack any uniformity have produced very serious repercussions on inter-State transactions. There is great need for rationalisation of the country's tax structure in this respect and for evolving a uniform system of sales tax with a view to removing the adverse effects of the same on the economy as a whole.

Question 27.—How far in your view could the tax system be used to secure any order of priorities in the development programme in the private sector?

One of the methods recognised for the purpose is the system of differential tax measures affecting different industries in terms of a certain order of priorities. However, there are serious limitations to this and we believe that the existing provisions of the Industries Development & Regulation Act can be used with advantage for the object in view.

Question 28.—What are the possibilities and limitations of tax policy as an instrument of economic development: (a) by influencing overall demand, (b) by reducing consumption and unessential investment, (c) by positive inducements for desirable investment, (d) by redistribution of incomes, and (e) in other ways?

While it is recognised that tax policy can be utilised as a powerful instrument for economic development, it is necessary to emphasize that in a backward economy it has to operate under definite limitations. As already pointed out, in a poor country there is little scope for tax policy being geared up for reducing overall demand and in reducing consumption and unessential investment. "Aid to industry" programme, as indicated earlier, can provide positive inducements for certain types of desirable investments.

Alternative (d) is already replied to in earlier questions.

Question 29.—How would you assess the scope and efficacy of tax policy as compared to monetary policy and direct controls as an instrument of planned economic development in India?

A tax policy aiming at a rationalised and broad-based tax structure can play an important part as an instrument of planned economic development. Planning is essentially a problem of investment and to the extent that a sound tax policy facilitates savings and consequent capital formation, it can accelerate the rate of economic progress in a backward economy. Monetary policy forms an integral part of the broad economic policy which a country follows and as such monetary and fiscal policies judiciously used can become a useful instrument for ensuring the sound working of the economic system. Except under conditions of emergency we do not favour the use of direct physical controls. We hold that a properly working price system is definitely better than the system of physical controls as the normal methods of regulating economic life. It may not be out of place to quote here the views of Rt. Hon. Balfour of Burleigh, D.C.L., D.L., on the subject: "The price system is not only more efficient than physical controls but also more democratic. It is important to stress this because it now seems to be widely believed (often unconsciously) that the free price system is in some way morally suspect and that rationing and controls are in some way ethically superior and pay greater regard to social values. The truth is the very reverse. Yet there are people about—surely for the first time in our history—who seem to believe that rationing and controls are not only desirable as a normal feature of our economic life but represent an actual advance in economic organisation by comparison with the price system. Any such doctrine I regard as a complete fallacy."

Question 30.—Do you think that the present tax system in India makes for a reduction in inequalities of income and wealth?

The highly progressive and strict system of direct taxation in the present system ostensibly aims at reduction in inequalities of income and wealth by taking away substantial portion of income from the higher income groups. The same is directly confirmed by the Estate Duty measure where the statement of objects and reasons clearly mentions that the measure is calculated to reduce the existing inequalities in the distribution of wealth. However, in a backward economy there is a limited scope for using the tax system as an instrument of reduction in inequalities and if overdone the same may defeat its own purpose. What is important and should receive first priority is the problem of bringing about conditions of all-round economic development so as to be able to raise the standard of living of the people by increasing the total wealth of the country.

Question 31.—What modifications in the tax system would you suggest for securing a larger degree of economic equality, consistently with maintaining the incentives to capital formation and higher production?

The paramount need in a backward economy for maintaining and even increasing the incentives to capital formation and higher production has already been emphasized. As the limit has been reached as far as the present tax system is concerned and if attempts are made to make the same more steep or progressive, it will very seriously affect incentives to saving and capital formation ultimately defeating the objective of an all-round economic development. The emphasis should be first on achieving greater degree of development and towards that end creating conditions favourable for that. The stimulus given by such development will

inevitably result in increased benefit to a larger sector and a progressive elimination of the disparities in standards.

Question 32.—What place would you assign to public expenditure as compared with the tax system in achieving a greater measure of equality of income?

The fiscal instrument of public expenditure is mainly to be undertaken for widening the capital base of the economy, i.e., for increasing the productive power of the community. The broad objectives of this public expenditure must be to strengthen the economy in such a way as to make it capable of attaining progressively higher levels of output in course of time, and securing an increase in output of some essential consumption goods. Viewed from this angle, large-scale investment by the State for basic development can be a major instrument for securing economic equality, for it is through such investment that the agriculturists and other rural workers will be able to build up economic strength. We, however, deem it necessary to pointedly refer to the other aspect of public expenditure, viz., various measure of social welfare policy. There is need for a judicious determination of the appropriate plans amongst various programmes of public expenditure, and it will be risky to try to divert larger funds on measures of social policy, particularly in a background economy at the cost of economic development. In a system of mixed economy as is envisaged in the Plan, a special contradiction is likely to arise between development policy and welfare policy, if part of the economic development is to be financed mainly by the private sector. In this context, the tendency to finance welfare schemes through progressive taxation comes into sharp conflict with the necessity for providing the essential incentives for capital formation.

The views of Mr. Teodoro Moscoso, based on the experience of industrial development in Puerto Rico, may be quoted here with advantage:—

“A progressive welfare-oriented policy has strong internal pressures for increasing expenditures on housing, schools, roads, aqueducts, sewers, and other services on purely humanitarian grounds and without relation to the development implications. The implications of such a policy are manyfold. First, these services, though manifestly desirable are not inherently productive. Their provision diminishes the sums available for development activity *per se*. In the second place, such facilities generally, though not always, incur future operating charges which may be difficult to meet. These very drastic qualifications on the desirability of welfare must be constantly borne in mind but not to the extent that they reduce such expenditure below the level compatible with economic development, as when the health and education of the labour force are not improved with sufficient speed.”

Question 33.—Have you any changes to recommend in the tax policy in relation to the investment of foreign capital in India?

We have no special recommendations to make in the sphere, except to emphasize the point that the tax policy in relation to investment of foreign capital in India should not in any way be discriminating against the investment of Indian capital, in respect of any of the terms granted for the purpose.

Question 34.—Art. 269 of the Constitution enumerates the following taxes which may be levied and collected by the Union but the proceeds of which are to be assigned to the States:

- (a) duties in respect of succession to property other than agricultural land;
- (b) estate duty in respect of property other than agricultural land;
- (c) terminal taxes on goods or passengers carried by railway, sea or air;

- (d) taxes on railway fares and freights;
- (e) taxes other than stamp duties on transactions in stock exchanges and futures markets;
- (f) taxes on the sale or purchase of newspapers and on advertisements published therein.

How do you assess the possibilities of adding to the country's tax resources in respect of the above items?

In the present context of affairs, we do not think that there is much scope in materially adding to the tax resources of the country in respect of these items.

Question 35.—Other possible ways of adding to tax receipts which have been suggested are taxes on capital, reintroduction of the salt duty, surcharges on land revenue, betterment levies, agricultural income-tax, social security taxes and modification of the policy of prohibition having regard to the directive principles of the Constitution. What are your views re: the desirability and the probable scope of each of these forms of taxation?

The suggestion for reintroduction of the salt duty is on strong grounds. We also consider the surcharges on land revenue and agricultural income-tax as justifiable, in view of the recent shifts in the income of the agricultural sector. Likewise, owing to the proposed developmental expenditure in the sphere of agricultural development, the imposition of betterment levies can be considered with advantage, particularly in areas which benefit from such developmental activities undertaken by the State.

We do not favour the imposition of social security taxes and taxes on capital, inasmuch as these are likely to increase the already heavy burden imposed on industries at present and will result in retarding capital formation.

Question 36.—Do you consider it desirable and feasible to levy a tax on unearned increments in value of land and other property as a result of public projects of development?

It will be desirable to devise a scheme of levying tax on unearned increments in value of land and other property, as a result of public projects of development.

Question 37.—What measures would you suggest for increasing the receipts from existing sources of revenue?

As far as direct taxation is concerned, it must be remembered that the present high rate of income-tax is subject to the law of diminishing returns, and in fact it has already reached a point where there is a strong case for bringing down the rates to a reasonable level and readjusting the same in a broad-based manner so as to maintain the necessary returns from these sources. As to the sphere of indirect taxes in a backward economy where a large number of people are poor, it is a question whether indirect taxation should be used to produce the desired effect of reducing the propensity to consume.

Question 38.—What other new sources of taxation can you recommend?

The scope for new sources of revenue has already been indicated in replies to earlier questions.

Question 39.—To what extent and as regards what taxes should the powers of the Centre to impose surcharge under Art. 271 of the Constitution be used?

There is no scope for the Centre to impose surcharges as there is already a heavy burden of taxes on trade and industry.

TAXATION AND INFLATIONARY AND DEFLATIONARY SITUATIONS

Question 40 to Question 45.

These aspects have been covered in a general way in our observations on Question 1(c).

PART II.—DIRECT TAXES

INCOME-TAX

Before entering into a discussion of the specific points or issues covered by the questions in this part of the questionnaire, we would like to make some observations of a general character in order to emphasize the directions in which the scheme of direct taxation, both in its structural aspect as also in its detailed provisions, requires to be considerably modified. Earlier, we have already referred to the growth of the incidence of direct taxation and the increasing nature of the share of the yield from direct taxes. Taxes on income, in the pre-war year, represented less than 25 per cent. of the total yield of the Central Exchequer. At one time, during the war period, it had gone to nearly 70 per cent. and, at the moment, nearly 45 per cent. of the tax

yield of the Centre comes from taxes on income. Another striking feature which has been the subject of criticism is that the burden of direct taxation is not spread in a reasonable manner. The middle-class and the upper middle-class people are called upon to bear a disproportionate share. In proposals for reforming the structure of direct taxation, therefore, the importance of efforts to reduce or eliminate this disparity cannot be over-emphasized. The greatest drawback, however, of the present scheme of direct taxation is that the income level for the maximum rate of personal taxation is much lower in this country than in some of the advanced countries like even the U.K. and the U.S.A. The residue of income available for disposal, after

meeting tax dues under our system, also compares less favourably with the position obtaining elsewhere. The main problem, therefore, is one of evolving proposals which would result in securing the spreading of the tax burden more evenly and revising the rate structure in such a manner as would assist the conservation of a part of the income for utilisation in developmental purposes. The changes necessary for realising the above objective are being indicated in detail in reply to the different questions. At this stage, we would only wish to emphasize that the Commission will necessarily have to give great importance and thought to these aspects which are of a cardinal nature, in any attempt to make our scheme of direct taxation more rational.

The detailed nature of the questions in this part of the questionnaire dealing with the Income-tax law and procedure, naturally raises the presumption that the recommendations of the Commission would cover not only the broad aspect of the structure of taxation, but also detailed provisions of the law embodying the scheme of taxation as such. We would like to point out that the structure and law of direct taxation in the country are, more or less, the result of a haphazard growth. Revenue exigencies, from time to time, have led to the expedient of stepping up rates, imposing surcharges or making flat and all-round increases in the rates, such changes not being the result of anything like an expert scrutiny or warranted by the capacity of those concerned to bear the effect and consequence of the burden. There is, therefore, a strong case for rationalising the whole structure. The depressing effect of the existing scheme of taxation on investment activities in the country has come to be recognised. The main problem, therefore, is to devise a tax structure which would be considered fair in its incidence by all sections of the society and, at the same time, adequate to meet the needs and requirements of an expanding economy. In the ultimate analysis the taxation policy and procedure should subserve the larger economic policy and should not come in the way of the larger objective of increased investment support for the country's programme of development and reconstruction.

The complicated nature of the tax law is another aspect which has been the subject of critical comments. Successive attempts to make the tax more productive and the consequent over-growth of amendments have resulted in making the Income-tax law cumbersome and involved with the result that the average assessee has inevitably to invoke the assistance of experts in discharging even the normal requirements under the law. It is not that every assessee is in a position to commend the assistance and services of qualified experts and the feeling of harassment caused by the complicated nature of the tax law calls for special attention.

Apart from the need to adjust the progression in rate in such a manner as not to destroy the element of personal initiative or incentive for expansion of activities, consolidation of the rate structure in such a manner as to avoid taxation under different nomenclatures is very desirable. The rate structure should be simplified by prescribing a composite rate, eliminating the present practice of two distinct levies in the shape of income-tax and super-tax, although both the taxes, in effect, are taxes on income. Since the rate structure has recognised the principle of progression in rates adjusted according to levels of income, there does not appear to be any special justification for preserving the two taxes under different nomenclatures, and there is overwhelming justification for the point of view in favour of a consolidated rate. Such a combined rate would also remove the anomaly of the alleviations or reliefs accruing to the assessee under certain circumstances not being available so far as super-tax is concerned. Illustrating the point, earned income relief and relief in respect of dividend income are not available for estimating super-tax liability. With a composite rate this type of hardship will be removed.

Suggestions have been made, from time to time, both by us and by other representative organisations, in regard to the changes and reforms necessary in the existing provisions of the law and the scheme thereunder as also in regard to the manner and method of applying and administering some of those provisions. We request to be allowed to recapitulate some of these suggestions which are of vital importance in any effort to ensure that the scheme of direct taxation takes due account of the practical needs and requirements of the situation.

Depreciation Allowance and Replacement Cost

The present provision in regard to the grant of depreciation allowance have been found, from practical experience, to be inadequate. They require to be liberalised in the following directions:

The second proviso to Section 10(2)(vii) of the Indian Income-tax Act treats excess sale proceeds of machinery or plant as income liable to taxation. Thus, when any asset is disposed of, where the amount for which the

same is sold exceeds the written-down value, so much of the excess as does not exceed the difference between the original cost and the written-down value is deemed to be profits of the year in which the sale took place and assessed to tax. This results in a great disadvantage to undertakings having assets of large value. It is common ground that the outlay for a new unit, in the process of replacement, is of an increased magnitude and as such the taxation of the excess proceeds of the discarded machinery is a definite handicap. Such excess should be allowed to be ploughed back, free of tax liability, for subsequent use in the process of replacement.

The present arrangement regarding grant of depreciation is linked to the original cost of the machinery. The theoretical assumption is that the sum of all these annual allowances plus any proceeds on the sale of the plant as scrap should equal the cost of replacing the asset. Even under fairly stable prices, the improvements in technique or designs of plant and equipment affect the estimate of such allowances on that basis. In a period of rising prices and rapid technical improvement, the cost of replacement will be disproportionately high and the fund built up on the basis of the present calculation will be only a proportion of what is necessary to replace the asset by a new unit of the same productive capacity. The question as to how far the factor of replacement cost has to be taken into account in determining the basis of allowance for depreciation, is one of the major problems which the Commission will have to tackle. Government have for purposes of Railways accepted the principle of linking Depreciation to Replacement Costs. The real solution of the difficulty will have to be attempted by a radical change in the ideas relating to the economic concept of profit so that some kind of charge for financing of replacement of equipment would come to be accepted as an item of expenditure in calculating profits. The acceptance, in principle, of a system of tax-free replacement reserves, with some safeguards to ensure that those reserves are used only for replacement purposes, will, perhaps, offer a practical solution to the difficulties inherent in this present arrangement. Grant of additional depreciation allowance on a tax-free basis to meet the differential cost of replacement, grant of interest-free loans by Government or statutory lending authorities like the Industrial Finance Corporation for assisting replacement programmes, etc., are some of the other suggestions which may be favourably examined by the Commission. In the case of Plant and Machinery required by purchase, practical difficulties have been experienced in the process of administering the provisions in regard to Depreciation. The Income-tax Officers, it appears, are sometimes inclined to question the purchase price as recorded in the books of the purchasing company and to disallow the quantum of depreciation claimed, on the ground that the purchase price was higher than what should be normally allowable in his opinion. Whenever such purchase price is indicated or mentioned in any document of transfer or sale, the same should be taken as *prima facie* correct, unless there is occasion to suspect fraud, and accepted for purposes of grant of Depreciation.

Anomalies and Difficulties experienced under Section 23A

We had, in the past, on more than one occasion, drawn the attention of the authorities to the anomalies inherent in the present provisions relating to taxation of income of companies in which the public are not substantially interested, under Section 23A of the Indian Income-tax Act. The question of liberalising compulsory requirements in the provision so as to allow sufficient freedom and initiative to the shareholders of such companies to conserve a portion of the profit made in a particular year for the purpose of assisting a programme of expansion, requires to be immediately tackled. It is but proper that instead of a private company under such circumstances being obliged to borrow money from outside sources for purposes of its developmental requirements, it should be free to desist from distributing profits as dividend to the maximum limit required in terms of the provisions in the section and to conserve a portion for utilisation in such developmental programmes. Under the U.K. income-tax law, it is open to an assessee, governed by the corresponding provision, to show to the satisfaction of the Commissioners of the Inland Board of Revenue that the company concerned has not unreasonably withheld any income from distribution and on that basis the assessee would be allowed the benefit of some flexibility in the quantum required to be distributed as dividend.

Apart from introducing an element of flexibility in regard to the quantum required to be compulsorily distributed, there should also be provisions permitting adjustments to meet difficulties of a practical character. In the case of a company having branches functioning in foreign territories, actual difficulties may be experienced in securing remittances from such branches by reason

restrictions on movement of capital or moneys, imposed by the authorities of those countries. The company concerned, under such circumstances, may not have funds in this country sufficient to ensure distribution upto the prescribed limit. In determining the amount for distribution, obligatory charges such as those levied by a Government of a State or by a Local Authority which may not have been fully allowed in computing assessable income of the company, will also have to be allowed. Further, on occasions when it is difficult for an assessee to estimate exactly the assessable income, an opportunity should be given to make up the full 60 per cent. or whatever the prescribed limit.

Under the present provisions again, when the accumulated reserves of such a company, in which the public is not substantially interested, exceed the paid-up capital, the full 100 per cent. of the profits is required to be distributed. This compulsory distribution of the entire profits should not be enforced. If the shareholders of such a company desire further allocation to themselves, the Department should not come in the way of such allocation by arbitrarily insisting on 100 per cent. distribution of profits.

There is also another practical difficulty in administration, which has been noticed. At present, the completion of assessment work takes an unduly long time, and if after a period of 2 or 3 years the company is required to compulsorily distribute the deficiency as determined by the Income-tax Officer, having regard to the items which he considered as disallowables, the company may not be able to find the resources necessary for such supplementary distribution. Therefore, the time-limit, of say 2 years from the date of passing of the Balance Sheet for the relevant period, should be fixed, after which there should be no orders for compulsory distribution.

Sections 42 and 43

We would like to re-state the general case and grievance of the assessee about the extremely unsatisfactory position resulting from the provisions of Sections 42 and 43 of the Indian Income-tax Act as they stand at present. The general complaint is that the provisions in the section have been so administered that Indian exporters who sell goods to foreign buyers and Indian importers who buy goods from foreign sellers, even in cases where such transactions are as between principal and principal, are being treated as agents of non-residents concerned in respect of such transactions and on that basis, are being subjected to tax in respect of profits or gains deemed to have been made by the non-resident. Although we have been assured that the intentions of both the legislature and Government are that actually, the liability of the agent to pay the tax will not arise except where something definitely in the nature of an agency existed, in actual practice, the application and the enforcement of the provisions in the section, it is noted, goes counter to the main purpose and primary intentions of the legislature and Government in making the agent responsible for the tax liability of the non-resident. The confusion and the difficulty have really arisen because the term 'business connection', occurring in the section, has been very literally construed both by the taxing authorities and by some of the High Courts in the country. If a strictly literal interpretation is given to the term, it would appear that even a single transaction between a resident and a non-resident would be deemed as a business connection and on that basis the resident would be called upon to discharge liability as agent, in respect of the tax due from the non-resident. In order to remove the doubts regarding the real intentions of the scope of the liability contemplated by the provisions in question, we had, in the past, indicated the importance of an entire review of the provisions in Sections 42 and 43. We had also drawn the attention of Government to the practical difficulties with which the persons, who were treated as agents of non-residents, were being confronted. It is not possible for such agent, where a non-resident had more than one agent, to know the total income of such a non-resident through the agency of different persons in the country and consequently it is not possible for any such agent to ascertain the tax liability and retain sufficient amount in his hands to meet the liability when the demand is finalised. This view has been confirmed by the observations made by the Chief Justice of Bombay in a recent reference involving interpretation of the sections in question. Moreover, under the existing sections, a resident agent is made liable in respect of income made by the non-resident principal on account of 'business connection'. The expression 'business connection' has nowhere been properly defined. The vicarious liability to which a resident is subjected under the existing provision should be removed and the sections in question should be so amended so that a non-resident principal would be subject to the taxation laws of this country only when he exercises a trade in the Union of India and not merely

with India. In short, the changes required in regard to the provisions in question may be briefly summarised as under:—

- (1) It should be made clear that, firstly, there would be absolutely no tax liability on transactions purely on a principal to principal basis;
- (2) secondly, that the vicarious liability to which a resident is subject under the present provisions, should be removed by providing that a non-resident principal would be subject to the taxation laws of the country only when he exercises a trade in the country, as is the position under the corresponding provisions of the U.K. law; and
- (3) thirdly, in any event, the liability of an agent should be confined to the funds or moneys of the non-resident actually coming into his hands in excess of the commission or remuneration to which the agent may be entitled and where such an agent has no money from such a non-resident at the time of assessment, he should not be held liable for any payment on behalf of the non-resident.

A *bona fide* commission agent or *bona fide* broker should not be considered as an agent for purposes of Section 43.

The Income-tax Appellate machinery to be separated from the administrative machinery

The view that the Appellate machinery under the Income-tax Act should be completely divorced from the administrative side and that towards that end the Appellate Assistant Commissioners should be placed under the administrative jurisdiction of the Income-tax Appellate Tribunal has often been stressed. This view found support from the Income-tax Investigation Commission also. It is a salutary principle that the executives, who are concerned with deciding matters of fact or law, should not themselves sit in judgment on any points arising out of such decisions which are brought up for appellate consideration. The need for reform in the direction of separating the judiciary from the executive has been acknowledged in other spheres and the present suggestion is an extension of the same principle. The experiment begun in 1939 of making the appellate machinery independent of the charging machinery should be carried forward to its logical conclusion and the Appellate Assistant Commissioners should be removed from the control of the Commissioners of Income-tax and the Central Board of Revenue and placed under the Income-tax Appellate Tribunal. "On the principle that not only should justice be done but that it should appear to be done and should inspire confidence in the persons concerned, we think that the present system requires alteration"; in the above words the Investigation Commission supported the public demand for this reform.

Regarding the composition of the Tribunal, we had often in the past stressed that the Accountant Member of the Tribunal should be one chosen from the practising profession. Lately, retired Income-tax Officials are being appointed as members of the Tribunal. This is undesirable and should not be allowed.

Difficulties in the process of income-tax administration

While the importance of enforcing due observance and compliance with the requirements of the law in force from time to time will be readily conceded, some of the causes and circumstances responsible for creating a feeling of oppressiveness in the minds of the assessee as a result of the administrative practices of the Departmental officers require to be gone into. The general complaint is that in the anxiety to augment collections, there is generally a tendency on the part of the Income-tax officers to over-assess. It may be argued that the assessee has the right to press the matter on appeal and get the position rectified. In the meanwhile, the demand is enforced and the assessee is called upon to pay to the full extent of the demand; requests for time for stay of enforcement of the disputed portion are not generally agreed to and even the Income-tax Investigation Commission found it necessary to recommend the insertion of a specific provision conferring a right of appeal for stay of enforcement. If the right to the benefit of stay of recovery of the disputed portion upto the time the appeal is decided is legally recognised, the grievance of the assessee resulting from the denial of this facility would automatically go. The attitude of the officers in applying the penal provisions of the Act also calls for a definite change. The tendency seems to be imposed heavy penalties for even defaults of a technical nature. In applying the penal provisions, the officers should be required to be guided by the larger point of view of corrective action and penalty should not be imposed merely to recover additional revenue to the extent authorised by law. Delay in completing assessments, and delay in passing and settling claims

for refund are other spheres in which complaints of a general nature persist. Unless the law imposes a definite obligation to complete assessment within a short period and to grant refund within a prescribed time-limit, complaints in these spheres will persist. Non-acceptance of accounts submitted by assessee and assessment on the basis of assumed margins, etc., are some of the other general grievances of the assessee. We are mentioning these to emphasize the importance of sustained effort to usher in an era of relationship between the assessee and the department in which the former is encouraged to feel that the law was being administered in a fair and reasonable manner. Often-times the official spokesmen at the helm of the Income-tax Department assert that the law was being administered in a fair manner. The test should be that the public should also share that feeling and on the administrative side the importance of public relation should be sufficiently impressed. In this connection, the Commission may consider the feasibility of creating, at each important regional Income-tax Headquarters, some sort of machinery—may be in an advisory capacity—which could go into the difficulties and complaints in the administrative sphere. In that machinery non-official representatives of accredited organisations should be included. The public should be encouraged to place their difficulties, particularly pertaining to administration, before that advisory machinery, so that the very knowledge that departmental action would be subject to constant informal or advisory review, would be helpful in creating more cordial relations between the departmental officers and the assessee. Greater care in the selection and training of personnel recruited as Income-tax Officers is called for. During the period of the War, the Department expanded considerably and the basis of selection was relaxed. Apart from such Officers having an adequate theoretical knowledge of accounts and trade laws, they should be also given intensive training at headquarter Income-tax Office for a period of not less than 2 years. Again, as accounts in the case of smaller assessee may be maintained in vernacular, the Income-tax Officers should know or should acquire adequate working knowledge of one of local vernaculars. With these preliminary observations, we would proceed to deal with the question *seriatim* :

RESIDENCE

Question 46.—Do the provisions of the Income-tax Act (Sections 4A and 4B) regarding the determination of residence of various assessee, viz., individual, Hindu undivided family, firm, association of persons and company, require any modification? In particular, what is your view regarding the retention of the category described as "not ordinarily resident"?

The principle of taxing a resident assessee on his world income was first introduced by the Indian Income-tax (Amendment) Act in 1939 and the category of "not ordinarily resident" was then brought in as a concession to assessee who were foreigners and who were in the country temporarily for the purpose of their business or vocation. There is no longer any need to continue this special position. The Income-tax Investigation Commission had recommended the abolition of this category of assessee and we are in favour of dividing the assessee for the purpose of tax liability under two broad categories, viz., resident and non-resident.

According to Clause (iv) of sub-sec. (a) of Sec. 4A, an individual would be a resident in India if he has arrived in India during the relevant year and the Income-tax Officer is satisfied that he is likely to remain in India for not less than 3 years from the date of his arrival. According to this provision, an individual who comes to India will be liable to be taxed as a resident if the Income tax Officer is satisfied that he is likely to remain in India for not less than 3 years from the date of his arrival, even though his actual residence in India may be only for a small period. Further, since an assessment may be closed and completed after over 3 years, the Income-tax Officers' finding on the question whether the assessee is likely to remain in India for not less than 3 years from the date of his arrival will be a finding after the event. We, therefore, suggest that this Clause should be deleted.

INCOME

Questions 47 and 48.—Does the definition of "income" [Sec. 2(6C)] require any modifications? Are there any receipts or gains which are not taxed at present, but which, in your opinion, should be taxed and vice versa? In particular, what is your view regarding the taxing of capital gains?

The existing definition of 'income' is inclusive and not exhaustive. In the case of Mutual Insurance transactions, the resultant surplus would not be normally income, whether the transactions are with members or with non-members. But the definition of 'income' makes such surplus liable to taxation as 'income'.

There is no difference between the surplus of a Co-operative Insurance Company and the insurance business transacted by a Mutual Association. Therefore the definition of 'income' should be changed, so as to exclude the profits of a business of insurance carried on by a Mutual Insurance Association.

Taxing of Capital Gains.—We are not in favour of taxing capital gains. The limited experience of the working of the Capital Gains Tax in force from 1947 to 1949 confirms the general view that it has an adverse psychological effect on investments, and it would hamper the free movement of stocks and shares. In fact, the Finance Minister of the Government of India acknowledged these aspects in his speech while moving for the abolition of the levy in 1949. The psychological reactions following the existence of such a levy should not be ignored. During appreciation in capital value on account of temporary factors, there will be disinclination to sell capital assets. In periods of comparative slump, on the other hand, there will be an inducement to sell with a view to claim set-off of loss against other income. In the result, there will be no stable recurring revenue from such a form of taxation.

Question 49.—Have you any comments on the present position re : taxation of profits which accrue or arise abroad, on their repatriation to India?

It is relevant to recall that the 1939 Amending Act substituted accrual of income as the basis of liability in place of the remittance basis previously in force in the case of the foreign income of a resident in this country and thereafter the resident is being taxed on the basis of his world income. Naturally, the foreign income of a resident assessee, after that date, has borne taxation and therefore the amount represented by such profits could be brought by him into the country. Taxation consideration would not stand in the way of the amount represented by such profits being brought to the country, whenever the assessee chooses. There is however, the case of income and profits earned by resident assessee between 1933 and 1939. Even if the assessee wish to bring the same to the country at this stage, they would feel discouraged to do so, because of the fact that the same would attract taxes as soon as it is brought to the country. Government should be alive to the importance of attracting increased capital for utilisation in the country. It would be in keeping with the present objective of assisting the flow of capital if foreign income, profits and gains of Indian residents, made during the period 1933 to 1939 is allowed to be remitted to the country without any liability in regard to tax.

Foreign profits, remitted or brought into India by a person within the first 2 years of his becoming a resident in India, are exempt. The period of 2 years fixed for the purpose of repatriation of foreign profits is inadequate. In view of the various restrictions existing in overseas countries regarding movement of capital outside their limits, it may be impracticable, in many cases, to transfer an assessee's entire resources within the period allowed. We, therefore, suggest that in the first instance, the period should be increased to 5 years and, if it is proved, by reasons of the existence of checks on movement of capital in other countries, that in a particular case the same could not be repatriated within 5 years, the scope of the relief should be extended to subsequent years also, when actually the remaining portion of the foreign profits is brought back into the country.

Question 50.—What change, if any, is called for in the definition of 'dividend' [Sec. 2(6A)]; e.g., in relation to 'bonus shares'?

We do not think any changes are necessary in the definition of 'dividend' in Section 2(6A).

Question 51.—Do the provisions of the Income-tax Act relating to the taxability of non-residents through their business connections in India in respect of income deemed to accrue or arise within the taxable territories (Secs. 42 & 43 of the Income-tax Act) affect adversely the interests of persons engaged in foreign trade? If so, what modification would you suggest in these sections?

We have already, in our preliminary observations, referred to the unsatisfactory nature of the provisions in Sections 42 and 43 and the working of the same. Briefly stated, the changes required are that there should absolutely be no tax liability on transactions purely on a principal to principal basis, that the vicarious liability which a resident is subjected under the present provisions should be removed by providing that a non-resident principal would be subject to the taxation laws of the country only when he exercises a trade in the country and that in any event the liability of an agent would be confined to the funds or moneys of the non-resident actually coming into his hands.

Question 52.—What modification would you suggest in the definition of 'agricultural income' [Sec. 2(1)] to

avoid the contingency of the same income being taxed by the Central Government as well as the State Governments, e.g., in respect of income from forests, dividends from agricultural companies, etc.?

Income derived from land would be treated as agricultural income for the purposes of the Indian Income-tax Act only when the land is assessed to land revenue in the taxable territories. The justification for the income-tax exemption thus is that the land and the revenue therefrom has borne a prior tax or rate. In the past, the spirit of the above exemption was fully respected for income-tax purposes and dividend income from agricultural undertakings was excluded from income liable for taxation. Unfortunately, the above position has been upset by certain recent legal decisions on the ground that dividend income was not directly received from land. Without going into the fine legal distinction involved in the above decision, we would urge that the position should be made clear by suitably amending the provisions in the Income-tax Act, so as to confer exemption on such dividend income.

Question 53.—Are you in favour of integrating agricultural income with non-agricultural income for rate purposes? If so, which of the following methods would you advocate :—

- (i) Aggregation of agricultural and non-agricultural incomes only under the State Acts ;
- (ii) Aggregation of agricultural and non-agricultural incomes only under the Central Acts ;
- (iii) Aggregation of agricultural and non-agricultural incomes both under the State and the Central Acts?

Please discuss the administrative, constitutional and other problems that are likely to arise if any of the above alternatives is adopted.

Question 54.—Would you recommend the abolition, by a suitable amendment of the Constitution, of the distinction between agricultural and non-agricultural incomes and the taxation of both types of income, aggregately under a Central Act?

Agricultural income is, in terms of the provisions of the Indian Constitution, out of the sphere of Central taxation. In the past, suggestions were made that the exemption of agricultural income for purposes of Income-tax should be discontinued. The Ayre's Committee had also recommended that agricultural income might, at any rate, be taken into account for the purpose of determining the rate at which tax on the other income should be computed. Apart from the constitutional difficulties which by themselves are valid and substantial against agricultural income being aggregated or taken into account for rate purposes, certain recent trends of legislation in the sphere of tenancy rights and land tenure call for a new approach to the problem. For agricultural income, naturally the exemption limit will have to be kept at a comparatively high level. The land revenue payable will also have to be taken into account. Lately, agrarian reforms in the States, wherever they have been undertaken, indicate distinctive trends. Larger holdings are being prevented and compulsory distribution of holdings is being attempted. The large agricultural land-holder, with substantial resources in the shape of recurring yield will, perhaps, be no longer there. In the light of these developments, such additional taxation on agricultural income, as may be necessary, will have to be confined through an increase in the land revenue rates or, as is already being done in some of the States, by a separate agricultural income-tax leviable by the State. It is difficult to envisage State authorities surrendering their constitutional right over agricultural income and as long as the two types of income, viz., agricultural and non-agricultural, are under the jurisdiction of two taxing authorities, any proposal for aggregation, whatever be its fiscal justification, is not easy of realisation.

Question 55.—Is the treatment given to irregular and fluctuating income in the present law satisfactory? In particular, should any changes be introduced—

- (i) to average income over a number of years where receipts are irregular and fluctuating ;
- (ii) to spread lump sum receipts over a number of years ?

Section 12AA of the Income-tax Act, which is a new provision inserted by the Finance Act, 1953, has recognised the principle of spreading over a period of years income of an irregular and fluctuating character. But the provision is confined to specific cases, viz., royalties or copyright fees for literary or artistic work. There are other types of income of this nature. Some general provision which would enable such income being spread over, in an appropriate manner, is called for. In the case of a film undertaking, for example, the receipts in a particular year, for right of exhibition of a film for a period of years, will have to be suitably adjusted. Similarly, lump sum payments on termina-

tion of employment in the shape of gratuity or compensation for loss of employment should not, reasonably, be liable to taxation in the year of receipt as income during that year. Income from long-term contracts, or cumulative dividends, paid at a particular point of time should also be suitably adjusted for purposes of tax liability. Premiums received for lease of property should not be considered as income wholly received in the year of receipt, but should be spread over. Therefore, the law may include a general provision to permit of the same

EXEMPTIONS

Question 56.—Do you think the present provisions regarding exemption of charitable and religious trusts need any modification? If so, in what respects?

The provision in Section 4(3)(i) secures exemption from tax liability for income held under Trust for religious or charitable purposes. To entitle the benefit of the exemption, the source of the income should be from property held under Trust or which is the subject of Trust. Till recently property was deemed to include business carried on by a Charitable Trust where the income is exclusively used for religious or charitable purposes. This point of view was supported by a decision of the Lahore High Court. Government, however, thought it fit to withhold the benefit of the exemption for income derived from business by undertaking an amendment of the Income-tax Act in the year 1953. We feel that this amendment was not justified. Even if the source of income is business, so long as the income is exclusively used for the purpose of charity, the same should be eligible for exemption in the same manner as income from property held under Trust are exempt. The position should be rectified and the status quo ante should be restored.

Another point which requires to be noted, in this connection, is that ordinarily the exemption under this provision will be available only if the income is applied for charitable purposes within the taxable territories unless the Central Board of Revenue makes an order that the relief may apply even if the income is applied to charitable purposes outside the taxable territory. The restriction that in order to obtain exemption the income should be applied within the taxable territories is likely to create hardship in the practical application of the relief. In the case of charitable trusts which, from traditional times, have been awarding scholarships to Indian nationals for higher technical studies in foreign countries, the withdrawal of the relief, on the ground that the income is not being spent within the taxable territory, would amount to a hardship. The law may, therefore, be suitably amended so as to make it clear that where the amounts are spent for purposes or objects ensuring ultimately to the benefit of the country or to the nationals of the country in general, the same would be allowed, notwithstanding the circumstances that the amount may have been spent outside the country.

Question 58.—Are you in favour of continuing the concessions given to new industrial undertakings under Section 15(C) of the Income-tax Act? Have initial and extra depreciation allowances made the concessions practically infructuous? If so, what are the directions in which the provisions of this section should be modified?

Section 15(C) of the Indian Income-tax Act provides a measure of relief for new industrial activity, in that income-tax shall not be payable by a new industrial undertaking on so much of the profits or gains as do not exceed six per cent. on the capital employed in the undertaking for a period of years commencing from 1st April 1948 to 31st March 1954. We are in favour of the relief and encouragement being continued. The grant of initial and extra depreciation allowance in no way affects the justification and need for the above relief. While higher initial depreciation allowance affords some measure of financial assistance, it must be pointed out that such allowances, in effect, are only in the nature of interest-free loans to the undertaking in the initial period against the mortgage of its future depreciation allowance as the total of the allowances, including the initial slab, will not be permitted to exceed 100 per cent. of the cost of the plant and machinery concerned. Therefore, the system of increased initial allowances cannot be considered as anything in the nature of effective relief. New manufacturing concerns are encouraged in a similar manner by provision for a tax-free period under certain circumstances in other countries also. The question of further modifications and relaxations in favour of new industrial undertakings in the provision under the section may well be examined. For instance, the restriction now in force that the relief shall be available only in the case of an undertaking employing more than 20 workers or 10 workers in the case of industries worked by power, as the case may be, requires to be reconsidered and there need not be any limit with reference to the number of

employees. Again, the benefit is intended to be available only to industries started between the years 1948 and 1954; on the other hand, the provision may be general and whenever new industries are started, the relief should be available. For the purpose of calculating the profits to be exempt from tax to the extent of 6 per cent. per annum on the capital employed in the undertaking, initial depreciation allowed for new property, machinery or plant should not be taken into consideration.

Question 59.—*A suggestion has been made that banking profits of foreign branches of Indian banks should be given concessional treatment for tax purposes in order to encourage the opening of branches abroad. What are your views?*

We are in favour of the proposal that banking profits of foreign branches of Indian banks should be entitled to concessional treatment for tax purposes in order to encourage the opening of branches abroad. We would also suggest that the principle of affording concessional treatment in respect of profits of foreign branches should be extended to shipping and insurance companies.

Question 60.—*Should any liberalisation be made in the present limits of exemption from tax of life insurance premia and contributions to provident funds?*

Exemption from tax of amounts paid as life insurance premia and contributions to provident funds was intended to encourage thrift and to ensure that a person during his working period made savings in that form which would reasonably provide for himself and his family after active life. The limits prescribed under the Act are no longer adequate having regard to the reduction in the purchasing power of the money and the general increase in cost. There is, therefore, a justifiable case for an upward revision of these limits. At present, the total of the allowances under Section 15 in respect of insurance premia and under Section 58 in respect of contributions to provident funds should not exceed 1/6th of the total income of the assessee or Rs. 6,000, whichever is less, and in the case of a Hindu Undivided family, 1/6th of the total income of the assessee or Rs. 12,000, whichever is less. Normally the rate of contribution for purposes of recognised provident funds is 8 1/3 per cent. by the employer and 3 1/3 per cent. by the employee. Thus the limit of 1/6th of the total income is, as a matter of fact, normally absorbed by the provident fund contribution alone and in effect the relief by way of exemption for life insurance premia does not operate. We, therefore, suggest that the limit should be raised to 1/4th of the total income or Rs. 10,000, whichever is less, with corresponding adjustments for Hindu Undivided family.

We have elsewhere suggested that the present system of two distinct levies, such as income-tax and super-tax, should be consolidated. If, however, it is proposed to retain the two kinds of levy, life assurance premia and contributions to provident fund should be exempt from super-tax.

While on this, we would also like to draw pointed attention of the Commission to the discrimination in the basis of arrangement connected with tax relief in the matter of contributions to recognised provident funds as between provident funds for employees of Government and statutory organisations and provident funds for persons in private employment. The details regarding the difference in the basis of the relief are briefly indicated here below:—

Provident funds governed by Provident Fund Act, 1925.

1. The employers' contribution and the interest accumulations to the credit of the Provident Fund are not taken into account in computing the total income of the employee for purposes of income-tax liability.

2. Exemptions allowed:

(a) Insurance premia and employee's contribution to the extent of 1/6th of total income, (i.e., including private income, allowances, etc.) or Rs. 6,000 whichever is less [Sec. 15(1) and (3)].

(Thus in an 8 1/3 per cent. Provident Fund 1/12th of the total salary income is available for relief on account of insurance premia in addition to 1/6th of private income.)

(b) Whole of interest is exempted.

(c) Repayment of Provident Fund at the time of retirement or resignation—exempted unconditionally (4th proviso to Sec. 7).

Private Provident Funds recognised under the Indian Income-tax Act.

Under Section 58E of the Indian Income-tax Act, both these items are taken into account in computing the total income of the employee.

Exemptions allowed:

(a) Insurance premia and employee's and employer's contributions to the extent of 1/6th of the total income (i.e., including private income, allowances, etc.), but including employer's contribution and interest on Provident Fund) or Rs. 6,000 whichever is less [Sec. 58F(1)].

(Thus in an 8 1/3 per cent. Provident Fund there will be no margin for relief on account of insurance premia, unless the employee has got private income [Sec. 15(1) and (3)].

(b) Interest upto 1/3rd of the annual salary provided it is not allowed at a rate exceeding 6 per cent. per annum [Sec. 58F(2)].

(c) Exempted subject to conditions set out in S 58G (4th proviso to Sec. 7).

Apart from the injustice in treating the private section of the society on a differential basis, a large issue of policy is involved. In effect, the present position amounts to a lower basis of taxation for income earned by Government servants. Is such a preferential treatment ethically correct? We, therefore, urge that the provision in the Income-tax Act is suitably amended so that all recognised provident funds, including provident funds for private employees, are treated on a uniform basis for purposes of tax relief.

ALLOWANCES.

Question 61.—*(i) Do you favour the grant of larger depreciation allowances to assist industry to finance the considerably increased costs of replacement assets? If so, how and in what form should they be given—*

(a) by larger depreciation allowances on new assets;

(b) by revaluation of existing assets;

(c) by treating the excess of replacement cost over original cost as revenue expenditure;

(d) by any other method?

(ii) What is the justification for assistance from public resources to certain classes of taxpayers only by way of covering partially the excess of replacement cost over original cost of old assets?

(iii) In case adequate justification exists for assistance by Government in the form of tax concessions to meet the situation, what safeguards should be prescribed to see that the funds so made available are utilised for the purposes for which they are intended?

(1) We have already, in our preliminary observations stressed the importance of liberalising the basis of depreciation allowance so as to assist industry in its programme of renovation and replacement. The specific suggestions which might be considered are:

(a) Excess sale proceeds of machinery, under Section 10(2)(vii), should not be treated as income liable to taxation. The law should provide that such amount should be free from taxation provided the same is kept as reserve and utilised only for replacement purposes.

(b) The principle of tax-free replacement reserve should be recognised. It should be open to a company to set apart a certain percentage of the profits made by it in industry every year as a reserve to be utilised for purposes of replacement. Such reserves should be free from tax. Here a safeguard might also be included. If subsequently such accretions to the special reserve fund are not utilised for replacement purposes, the same should be liable to tax. In the alternative, the rebate of 1 anna now available in respect of undistributed profits ploughed back into the industry should be raised to 2 annas.

The grant of larger depreciation allowance on new assets alone will not prove to be a solution so long as the sum total of such allowance does not exceed 100 per cent. Income-tax authorities should be empowered to grant higher depreciation allowances in all cases, where the circumstances warrant the granting of such higher allowances.

The procedure of revaluation of existing assets may be helpful, but the point as to how that revaluation is to be applied for other purposes, viz., for purposes of the accounts of the company, requires to be examined in greater detail. Revaluation of existing assets should be done only by a body of experts.

Assistance in the shape of special loans from statutory lending organisations for financing replacement is another form of relief which may be considered.

(c) The proposal that excess of replacement cost over original cost may be treated as a revenue expenditure would afford material relief, but the point arises whether the profits of an undertaking in a given period would be sufficient to allow this relief being made available in a particular year. If the principle of carry-forward is to apply and that is for a fairly long period for such

excess of expenditure, then a solution in that direction may prove helpful.

Question 61.—(ii) and (iii) The questions here are based on the assumption that something in the nature of special favour is being shown to industrial undertakings. On the other hand, it should be viewed from the aspect of rectifying the damage done by a lacuna in the previous position. In the period of the war and immediately thereafter when the price structure of plant and machinery was progressively rising, industry was taxed to the full extent without making due allowance to the need for the future requirements as indicated by the rising trends in prices of plant and machinery. If in those years, those in charge of framing the tax policy had thought it fit to look ahead and allowed industry increased provision for future needs and requirements, the question of any special assistance at this juncture might not have arisen. Moreover, the problem has also to be viewed in a wider perspective. After all industrial asset is an asset of vital national importance. It is in the larger interests of the country to preserve that asset. If new industry is to be stimulated by the grant of concessions or other forms of assistance for preserving the general economic policy of the State, there is greater reason for some special consideration for assisting existing industry to preserve their productive capacity unimpaired in regard to their needs for replacing the existing wornout equipment.

The funds made available by tax concessions for assisting replacement should be strictly used for that purpose. If they are not so used, the tax relief should automatically go. Government might also prescribe other safeguards preventing mis-use or wrong use of such funds.

Question 62.—*Are any changes called for in the classification of assets for purposes of depreciation, rates of depreciation and methods of computing the allowances?*

In 1939 the law was changed whereby the written-down value method for purposes of grant of depreciation allowance was introduced. When the change in the method was announced, we had expressed the view that the depreciation allowance granted under the written-down value system would not be the actual depreciation and that in a period, when wear and tear was greater, the allowance for depreciation would be less. From time to time, organisations representing special branches of industry have placed before Government suggestions regarding changes in classification and the rates at which depreciation should be allowable for particular class of assets. Government may be requested to refer all such suggestions to an expert body like the Council of the Institute of Chartered Accountants of India. The task of reviewing and revising the classification and the rate structure may be decided upon after such an expert scrutiny.

Question 63.—*Should any tax concessions be given to encourage development of mineral resources? If so, what form should they take? In particular, should depletion allowance on wasting assets be allowed? How should it be computed for different kinds of assets you have in view?*

The principle of special encouragement for operations on wasting assets has now been recognised and taxation systems of other countries provide special reliefs or concessions for operations of that character. Under the English Income-tax Act, two kinds of allowances are granted. An initial allowance on the capital expenditure incurred in the acquisition of wasting assets is granted and an annual allowance calculated by reference to the output, it is understood, is also granted. The Taxation Enquiry Commission should recommend a provision for relief for undertakings involved in exploiting wasting assets like mines, oil-wells, etc. The details of the basis on which such allowances should be granted may be formulated and settled in consultation with organisations representing such mining and other interests.

Question 64.—*In what form would you provide for personal and family allowances—*

- (i) *exempting the first slice of income from tax; or*
- (ii) *providing specific allowances for family and dependents? In the case of (i), do you consider that the first slice Rs. 1-1,500—should be revised? In the case of (ii), what treatment would you give to the Hindu undivided family?*

In regard to taxation of personal income, it must be remembered that what is taxed is not the residue available after meeting what is essential for sustaining the life of the person. In short, the scheme of taxation is not the taxation of the surplus as such, but of the income as a whole. The case for specific allowance for personal income is, therefore, on strong grounds. The relief should be provided by a combination of both the methods, viz., increasing the slice which is exempt from

liability for taxation and providing allowances on the lines of similar allowances granted under taxation systems in other countries.

Regarding the tax-free slab, the present limit of Rs. 1,500 should be increased to Rs. 2,500. Allowance for children relief and allowance for dependents relief are allowances in force under the U.K. law. A specified allowance of say, Rs. 500 for each child should be available to a tax-payer for children under 18 years of age, living at any time during the assessment year with him. Such relief may be limited to four children. In the case of children over 18, allowance at the same rate should continue in the case of those who are receiving full-time instruction at a university, college or other educational establishments. In the case of a Hindu undivided family, allowance should be computed with reference to the number of children of each co-parcener in the family.

Question 65.—*Should the present law regarding admissible expenses [Section 10(2)] be altered? If so, please indicate, with reasons, the items of expenses (i) which are not now admissible but, in your view, should be admissible and (ii) which are now admissible, but, in your view, should not be admissible.*

Section 10(2)(xv) of the Act provides that any expenditure, not being a capital expenditure or personal expenditure, incurred wholly or exclusively for the purpose of business should be an admissible deduction. The complaint of the tax-paying public has been that while the responsibility for carrying on the business and earning the income which results in tax liability, is that of the assessee, the right of determining how far and to what extent the expenditure, claimed in connection with that business is admissible, is vested in the assessing authority. The general feeling is that the right is exercised vexatiously and not in a manner which takes due note of the practical realities of the circumstances connected with the business of the assessee concerned. All items of expenditure which, in fact, have actually been incurred and about which proof has been furnished to the assessing authority should, as a matter of course, be allowed. The Income-tax Officer should be empowered to go into the reasonableness of the expenditure only for purposes of ascertaining its *bona fides*, and not otherwise. There is then the case of expenditure for which proofs in the shape of vouchers or receipts cannot be submitted. It is common knowledge that in many trades there are secret commissions and other forms of special payments. As far as such commissions and special payments are concerned, they should be allowed within a reasonable limit.

Expenditure of an exploratory or developmental character should also, as a matter of course, be allowed. Illustrating the point, in efforts to explore new markets and possibilities of fresh or increased business, businessmen have sometimes to undertake extensive tour. In the year in which such tours are undertaken, the same might result in substantial expenditure. The compensating factor will be that, in due course of time, the same would result in additional business which, in turn, would bring additional income liable to taxation. The complaint is that the assessing authorities are inclined to take a limited and narrow view of such expenditure and they allow the same only if, as a result of such travel, in the accounting year, there has been a substantial addition of new business and new income. Expenses incurred for advertising should be considered as revenue expenditure and allowed as an admissible item.

The cost of income-tax appeals and references should be an allowable expenditure. Revenue expenditure incurred before business began should be allowed in the first accounting period. Legal costs on the acquisition of a lease or right should be allowed for the period of the lease.

Any expense or loss incurred in providing benefits for employees should be deductible. Any abortive expenditure should be deductible as an expense of the year in which it is incurred. Expenses incurred in successfully defending any criminal proceeding against an assessee in connection with the business should be allowed. We would here like to urge the importance of the law making it clear that all payments which have to be made as a consequence of the decisions of authority having legal force, should, as a matter of course, be allowed. Instances have happened where Tribunals, appointed by Government under the Labour Laws, have awarded certain payments in the matter of bonus, gratuity, etc., and where the Income-tax Officers have questioned such payments on the ground of either being excessive or not relating to the period for which the assessment was being made. In the case particularly of awards resulting in gratuity payments, the effect of the disallowance can be easily imagined. It must be realised that the employer has no choice in the matter, who has, perforce, to incur the expenditure when a properly constituted authority awards the payment.

If it is felt that such payments do not fall under Section 10(2)(xv), special provision should be made to make it clear that payments consequent upon decisions having legal character, should be allowed as items of revenue expenditure deductible in arriving at the assessable income. An attempt should be made, so as to be of guidance to the assessee, to codify items of expenditure which would normally be deemed as admissible deductions for the purpose of computing income for tax liability under Section 10. In the preparation of such a list, perhaps, legal decisions in the past in regard to points of dispute involving admissibility of particular items of expenditure would be helpful.

Rate Structure

Question 66.—(a) Are you in favour of combining income-tax and super-tax into a consolidated levy?

(b) What are the merits or demerits of such a step from the point of view of (i) assessee, and (ii) administration?

(c) Are you satisfied with the degree of progression in the present rate structure (both income-tax and super-tax) especially in regard to its economic effects?

(d) In case you consider a change is necessary, what alternative rate structure would you recommend?

(e) Should the rate of surcharge levied under Article 271 of the Constitution also be graduated?

(a) In our preliminary observations earlier, we have already expressed our considered view that the present position of two separate levies under the nomenclature Income-tax and Super-tax is not rational and serves no special purpose. Both the taxes are taxes on income and such direct taxation on income, as may be considered necessary for budgetary and other considerations, should be by a consolidated levy.

(b) The combined rate will show clearly the exact proportion of the tax burden on a given income. Administratively also, all the complicated calculations are avoided. From the point of view of the assessee, reliefs which are now not applicable in respect of super-tax will be readily available. Income from interest on Government Securities which are free of income-tax, is, for instance, not free of super-tax. Similarly, for super-tax purposes the exemptions in respect of charitable donations under Section 15B are not available. Earned income relief is also not available for super-tax purposes. The allowance in respect of insurance premium is not extended to super-tax purposes. Dividend income is included for purposes of computation of super-tax liability although such income might have borne both income-tax and Corporation Tax in the hands of the company.

(c) The degree of progression in the existing rate structure is very unsatisfactory. The maximum rate of taxation being applied at a comparatively lower level of income, the residue available at the disposal of an assessee, after meeting the tax demand, also compares unfavourably with the position under the taxation systems in other countries. Illustrating the point, on an assessed income of Rs. 5 lakhs, the balance available to an Indian assessee would be just over 24 per cent., whereas in Canada it is over 43 per cent. and in the U.S.A., over 51 per cent. The inevitable consequence is that the object of savings assisting capital formation to subserve the needs of an expanding economy is not facilitated.

(d) In the absence of detailed break-up figures of the aggregate income under the different slabs, it is difficult for the Committee of the Chamber to suggest a detailed rate structure indicating the rates of varying tax for the different slabs of income. They have already expressed themselves in favour of a combined tax structure, under which there will be only one kind of direct taxation on personal income. They have also urged that having regard to the imperative necessity for making the tax structure such as would leave in the hands of the assessee a residue of income adequate to stimulate capital formation and investment support, the maximum rate of personal taxation should be suitably lowered and the level of income at which such a maximum rate would be applicable adequately raised. Bearing these considerations in view, they are of the considered opinion that the maximum combined rate of tax should not, in any event, exceed 9 annas in the rupee and that the said maximum rate should be applicable to slabs of income of Rs. 2½ lakhs and over.

(e) We are not in favour of anything like a surcharge being levied on the income-tax rate. However, if, for reasons of an exceptional character such as meeting the needs of the Central Exchequer in an emergency, Government find it necessary to impose a surcharge, the same may be on a percentage basis of the existing rate; such percentage will automatically bring about a graduation in the different slabs of income. A graded

surcharge as such will be very difficult from the administrative standpoint. While on this, we would also like to stress that surcharges, whenever introduced for reasons of an emergency character, should be strictly of a temporary duration, viz., for the period of the emergency, for which the revenue therefrom is intended to be. Thereafter, the surcharge should automatically go. In any case, no surcharge should be allowed to remain in force continuously for a period of more than two years.

Question 67.—Have you any change to suggest in the exemption limit for individuals (Rs. 4,200) and for Hindu undivided families (Rs. 8,400)?

The exemption limit for individuals was increased this year from Rs. 3,600 to Rs. 4,200 and from Rs. 7,200 to Rs. 8,400 in the case of Hindu undivided families. The main consideration, which weighed with the Finance Ministry in recommending the raising of the limit was that, by so doing, the total number of assessee would be reduced by over 70,000, resulting in administrative convenience. The loss to the Exchequer was estimated to be less than Rs. 1 crore. We desire that the matter should be reviewed from another standpoint. The exemption limit is intended to ensure that the tax liability should accrue only after providing the necessary margin for meeting the minimum requirements of an assessee. In providing for such minimum needs, the effect of the present conditions on the cost of living should be given due importance. There is a strong case for an upward revision of the limit and we suggest that the same may be increased to Rs. 6,000. As regards the Hindu undivided family, the Income-tax Investigation Commission had recommended that the non-taxable maximum should be twice that prescribed for individuals and in the case of Hindu undivided families having more than four co-parceners, the non-taxable maximum should be three times that obtaining for individuals.

Differentiation

Question 68.—(a) Are you in favour of a distinction being made between earned and unearned incomes? What is the economic justification for such a distinction?

(b) Is the present definition of "earned income" in Section 2(6AA) of the Income-tax Act adequate in this respect or would you suggest any modification?

(c) Should the quantum of relief now afforded be extended or reduced? If so, to what extent?

(a) The distinction between earned and unearned incomes for purposes of tax liability may be continued. Such a distinction is obtaining elsewhere and is generally justified on taxation principles. Earned income is supposed to represent the result of personal initiative and effort and on that basis, is considered as entitled to special encouragement.

(b) We have no particular suggestions to make in regard to the definition of earned income. The present position seems to be satisfactory.

(c) Earned income relief is limited to one-fifth of the income or Rs. 4,000, whichever is less. Once the principle of earned income being eligible to a concessional rate is accepted, there is considerable force in the point of view that the relief should be extended to a larger sector. We suggest that the limit may be raised to Rs. 6,000.

Earned income relief should also be available in respect of income of a minor partner assessed in the hands of his father.

Miscellaneous

Question 69.—Have you any changes to suggest regarding the principles followed in valuing stocks or a business for assessment purposes?

We have in the past generally expressed ourselves in favour of stocks being valued at market value or cost, whichever is lower. What is, however, of importance is that there should be some uniformity in the system of valuation; the method of valuation should be regulated by accountancy principles. We suggest that the Council of the Institute of Chartered Accountants of India may be requested to go into this aspect from the point of view of accounting principles and prescribe a formula for adoption.

Question 70.—Do you consider that any change is called for in the method of assessment of the Hindu undivided family? If so, in what respects?

For income-tax purposes, the Hindu undivided family is being regarded as a single unit and assessed through the Manager or the *Karta*. We are in favour of the same position being continued. However, we are of the considered view that the Income-tax authorities should readily accept the Hindu joint family as having partitioned when such a partition is effected by an unequivocal declaration of partition on the part of the

co-parceners and the Department should not insist on partition by metes and bounds. As regards assessment, incidentally it may be mentioned that formerly there was a higher exemption limit in the case of the Hindu undivided family for purposes of super-tax. There is justification for an increase in the exemption limit if super-tax as a separate tax is to continue, although we have, earlier in our views, expressed ourselves in favour of a consolidated levy.

Question 71.—Should exemption from income-tax be allowed in respect of voluntary surrender by managing agents of the whole or a part of managing agency commission? What safeguards should be laid down against misuse of such a provision?

Managing Agency commission voluntarily surrendered either as a whole or in part should not attract tax. The amount represented by such commission having not been actually received by the Managing Agents, the question of any tax liability does not arise. The fear that a provision, that the exemption for commission surrendered is likely to be misused is far-fetched, as no Managing Agent is likely to surrender his commission except where in the larger financial interest of the company as such, such a self-denying option on his part is necessary. In any case, the test for tax liability should be whether the income has been actually received or not.

Question 72.—On what basis would you suggest that double income-tax avoidance agreements should be concluded between India and other countries?

The entire position in regard to the balance of advantage by India entering into agreements for avoidance of double taxation should be reviewed by an expert body. There is a general feeling that in the present context, the balance of advantage would be for the nationals of the other countries as Indian nationals claiming relief in respect of taxes paid to other taxing authorities would be comparatively small. The Central Board of Revenue might have the statistics about the comparative position and the extent to which Indian nationals, on the balance, are benefiting by the arrangement. If on such an overall analysis the general arrangement about bilateral agreements for avoidance of double taxation is not found suitable, the Indian tax law should substitute the same by a system of unilateral relief, i.e., our Exchequer should give relief to the nationals of this country to the extent of the smaller of the two taxes paid.

Question 73.—Is the present law relating to determination of 'bona fide annual value' of property and deductions allowed from it satisfactory? If not, please give any alternative proposals you have in this respect.

We would here like to draw the attention of the Commission that the entire basis at present obtaining for taxation of income from property requires to be reviewed. The amounts paid by way of Municipal Property Tax and Urban Immovable Property Tax are not being considered as items of expenditure allowable as a deduction for computing income liable to tax, in the result the property owner has to pay tax on what may be regarded as a notional income which has no relationship to the income actually accruing to him. The reasonableness of the claim for the allowance of such taxes was recognised by Government and in the Budget proposals for the year 1948-49 a provision for relief in respect of such payments was included. Unfortunately, the proposal was not pursued due to legislative exigencies. The issue of these items of expenditure being disallowed was also the subject-matter of an appeal before the Supreme Court and the Court in its judgment decided that what was paid by way of Municipal Property Tax and Urban Immovable Property Tax would be permissible deductions. Government subsequently chose to amend the provision of the Act in question so as to exclude from the scope of 'annual charge' any tax paid in respect of property and the relief secured to the assessee on the basis of the Supreme Court decision was rendered inoperative. We are mentioning these circumstances to reinforce the case for a categorical recognition that Municipal Property Tax and Urban Immovable Property Tax should be included in the expression 'annual charge' and on that basis taken into account for arriving at the income from property in respect of the *bona fide* annual value for purposes of tax liability.

Another anomaly operating in the sphere of taxation of property is that there is no provision for allowance for depreciation on buildings. Grant of depreciation is at present confined to property used for business. It is an acknowledged fact that all properties suffer in value by depreciation and there must be a regular provision for the grant of depreciation allowance for property for calculating tax liability.

It is also relevant to point out that charges for collecting rents and repairs have risen substantially.

The present allowance of one-sixth of the annual letting value is no longer adequate to meet these charges. Instead, we suggest that expenses actually incurred for such purposes should, as a matter of course, be allowed.

Income from property should not be assessed on a notional basis. The actual income should be ascertained and the assessment should be made as under Section 10 of the Indian Income-tax Act.

Question 74.—Is any change required in respect of provisions relating to carry-forward of losses? Are you in favour of allowing losses to be carried backward in case of cessation of business?

The Millard Tucker Committee which went into the question of reforming the Income-tax Law of the United Kingdom have recommended that carry-forward of business losses and set-off against subsequent profits should be available without time-limit. The feasibility of a similar facility being introduced here may be examined. Another limitation under the existing provisions, which cannot be reasonably justified is that carry-forward and set-off is available only against the income from the same business. This restriction is leading to vexatious results. Just as the liability of an assessee is determined by reference to the totality of his income, the relief in subsequent years should also be adjusted in relation to the total of his income from all business. The Finance Act of 1953 introduced another arbitrary element, in that speculation losses would be allowed to be carried forward and set-off only against profits or gains from speculation business and not from any other business. The distinction implied in the above arrangement is unjustifiable and will lead to anomalous results. We are of the considered view that this distinction should be removed.

The Millard Tucker Committee again have recommended that in the case of cessation of business it should be possible to carry back a loss incurred in the last year of the business and set it off against the assessments on that business for the three preceding years. The introduction of a similar facility here may be considered.

Question 75.—Do the provisions relating to the payment of advance tax under Section 18A of the Income-tax Act need any modification?

The system of advance payment was conceived as a war-time measure and was mainly intended as a check on the then existing inflationary condition as also to assist the ways and means position of Government. Even then we had expressed ourselves strongly against the proposal. The emergency having ended, there is no longer any justification for continuing the system of advance payment. The present arrangements are also found to be very inconvenient from the point of view of the assessee. It is difficult to estimate, in advance, every quarter, the likely income or profit position with reference to that quarter or prospectively for the year as a whole with any degree of accuracy. Particularly in a period of declining activities and trade recession, the expedient of advance collection of taxes will impose an avoidable strain on the financial resources of the assessee. Another great handicap is that there is no incentive for the Department to expedite the work of assessment. After the system of advance payment came into force, assessments are being kept pending indefinitely. After Government introduced the system of payment of tax dues in the form of advance deposits, the need for finance is no longer a compelling factor to expedite assessments. The removal of the system will, naturally, call for greater attention to the revenue needs of Government and the work of completing assessments will come to be expedited. At the same time, to facilitate the requirements of revenue, we suggest that the provision may be substituted by providing for the compulsory payment of the tax dues within a period of three months from the filing of the return, the tax liability being determined on the basis of the income shown in the return.

Question 76.—Do the principles underlying the assessment under Section 34 of the Income-tax Act need any modification?

The change effected in the position relating to reopening of assessments under Section 34 by the amendments made in 1948 is considered as having vested in the Income-tax Officers more discretionary powers which would enable them to reopen assessments even on mere suspicion. There should be some finality in the procedure and basis of assessments. Under the previous position, an Income-tax Officer could reopen an assessment only on the basis of definite information that income, profits or gains chargeable had, in fact, escaped taxation. There was, thus, a check on the arbitrary exercise of the right of reopening. The Income-tax Officer would be obliged to satisfy the assessee that he was acting on definite information or data. At present he would be in a position to reopen the assessment even if there is any reason to believe that the income has

escaped assessment. We are strongly in favour of restoring the old position under which the right of reopening should be exercisable only on the basis of definite information about escapement.

Question 77.—*What measures would you suggest for simplifying the procedure of assessment in order to reduce the cost of compliance with tax regulations?*

The procedure of assessment requires to be considerably simplified. In the first place, the Form of Return should be made more simple. The present Form has become very cumbrous and together with the Notes and Instructions, confuses an average assessee. The Central Board of Revenue should enlist the assistance of the Council of the Institute of Chartered Accountants of India for framing a simple form. The process of assessment should be expedited and towards that end, the feasibility of a provision that an assessment and the tax liability thereunder would come to be time-barred if the same is not completed within a period of two years instead of the present period of four years from the date of the submission of the return, may be examined. Mistakes of a formal or clerical character should be allowed to be immediately rectified. The Income-tax Officers concerned should be easily accessible to the assessee and should, instead of trying to find faults and mistakes in the Return and the records of the assessee should consider it as part of their duty to guide and assist the assessee with a view to the early completion of the assessment formalities.

Question 78.—*It has been suggested that the Appellate Tribunal should have powers to enhance assessments in the same manner as Appellate Assistant Commissioners have. What is your opinion?*

We are against any proposal for vesting in the Appellate Tribunal powers to enhance assessments. As a matter of fact, it is the assessee who generally would go in appeal against the quantum or amount of the assessments made either by the Income-tax Officer or the Appellate Assistant Commissioner. Further, the Tribunal is the final authority on questions of fact and no appeal or reference can be made from a decision on a question of fact. This being the position, there is no justification for suggestion that the Tribunal should be empowered to enhance the assessment.

Appellate Assistant Commissioners should also not be empowered to enhance the assessment. The present powers in that regard should be removed.

Taxation of Companies and Shareholders

Question 79.—*Do you recommend that an element of progression should be introduced in the corporation tax?*

We are against the levy of Corporation Tax as a separate tax. Joint-stock companies also should be liable to pay only one form of taxation on income and that should be the income-tax. As, in the case of companies, the ultimate liability of the shareholders would again be determined in the hands of the shareholders, the rate of taxation for the company as such should continue to be at a fixed basis without any progression or gradation.

It might be suggested that since Corporation Tax is an exclusively central source of taxation, a change in the above direction would lead to difficulties of a constitutional character, and that the central share of the yield from direct taxes would be affected. The constitutional distinction was, perhaps, with a view to facilitate ultimate distribution of the revenue from direct taxes. Necessary adjustments could be made by revising the basis regarding distribution between the Centre and the States. At the moment, the distribution is on the basis that 60 per cent. of the yield from Income-tax and Super-tax goes to the divisible pool, Corporation Tax being completely absorbed by the Centre. On the abolition of the Corporation Tax, the percentage for the purpose of the taxation pool may be revised. The States also will not suffer in the process for the obvious reason that the additional resources accruing from the Estate Duty will, in its entirety, go to the States.

While on this, we would like to mention in passing that if the Corporation Tax as a separate tax is continued, there is no longer any justification for denying to the individual shareholder the right of revision, in appropriate cases, in respect of tax paid on his behalf by the company in the shape of Corporation Tax as is the case for purposes of income-tax. Both the taxes are taxes on income and the shareholder should be entitled to the necessary adjustment in respect of the Corporation Tax paid on his behalf by the company.

Question 80.—*Would you advocate different rates for different types of corporate enterprises, e.g.—*

- (i) small industries;
- (ii) cottage industries;
- (iii) private limited companies or what may be termed proprietary companies;
- (iv) holding companies?

We are not in favour of different rates for different types of corporate enterprises. The rate structure should basically be uniform and, if necessary, the feasibility of relief by special concessions or rebates for such cases may be examined.

Question 81.—*There is a demand for the exemption of inter-corporate dividends from corporation tax. Do you consider this justified and, if so, why?*

If our suggestion for making the levy on joint-stock enterprise into a consolidated tax is accepted, the question of exemption of inter-corporate dividends from corporation tax would not arise. If, however, the corporation tax continues as a separate feature, then there is considerable force in the demand for the exemption of inter-corporate dividends from corporation tax, as otherwise, there would be double taxation of the same income at different stages.

Question 82.—*Do you think that any special provisions are necessary for the assessment of—*

- (a) banks; and
- (b) investment companies?

Do existing rules relating to assessment of insurance companies, especially mutual insurance associations, require any change? If so, in what respect?

(a) The business of banking has certain special features. As a credit institution, in a banking undertaking it would be part of prudence to provide adequately for future contingencies. The bank should, therefore, be encouraged to build up reserves for bad or doubtful debts as also for depreciation in investments. Banks, naturally, have to carry a large portfolio of investments. Allocations to such reserves should be allowed for tax purposes. In the case of the business of Banking, income under different heads should not be treated separately for tax purposes. The aggregate income, including income from property and other kinds of investments, should be treated as income from same business, so that there may be no difficulty for purposes of carry-forward and set-off of losses under different heads.

(b) At present the income derived by an investment company from dividends of other companies is exempt from super-tax liability. We have already indicated the desirability of introducing a rate structure under which super-tax as a separate tax will go. If that position is accepted, some form of concession in tax treatment for investment companies will have to be granted. Among other reliefs, the question of tax-free allocations reserved for depreciation in the value of investments may be specially considered.

The existing rules governing assessment of Insurance companies require to be modified in the following directions:—

(a) Regarding life insurance companies, re-insurance commission should be treated as a reimbursement of expenditure already incurred. It should not be treated as incomes under the schedule.

(b) Under Rule 4 of the Schedule where the assessment is made under Rule 2(b) on the basis of the annual average of the surplus disclosed by an actuarial valuation for an inter-valuation period exceeding 12 months, no credit should be given in terms of Section 18(5) for the tax deducted at the source in the preceding year. Where there is a valuation for five years and the assessment is made for three years only for that valuation and credit is given at an average tax deducted during the valuation period for three years only, as there is another valuation for three years which have been the basis of assessments thereafter, credit for tax deducted at source to the extent of 2/5ths in respect of five years' valuation is lost to the company. The company should not be deprived of credit of tax already deducted at source to the extent of 2/5ths.

(c) For purposes of carry-forward and set-off of loss under Section 24(2), Life and Fire Departments are treated as separate business so that the profit earned in any particular department could alone be set off against the loss of that department carried forward from the previous year. The two departments should not be treated as separate.

(d) Expenses for travelling, etc., in connection with opening of a new branch should not be disallowed. In this connection, it may be pointed out that the Allahabad High Court in the case of Hindustan Commercial Bank Ltd., held that expenditure incurred in connection with opening of new branches were not capital expenditure and were, therefore, allowable deductions. The High Court observed that by reason of opening of new branches, the out-turn of the business might have increased on which the assessee was liable to pay tax, but it could not be said that there has been any such acquisition of an asset which would amount to all the expenses being classed as capital expenditure.

Regarding General Insurance companies, the demand often placed before the authorities for allowing them the facility of building up additional reserves, requires to be sympathetically considered. Under the present arrangement 50 per cent. of the annual income is allowed for reserve for unexpired risks for Fire and miscellaneous policies and so far as Marine insurance is concerned, 100 per cent. is allowed. Insurance interests have represented that the experience of the working of this arrangement has not been satisfactory and there must be some flexibility in regard to the allowance for reserves. Possibly, the Indian authorities have followed the arrangements under the English law for the purpose of the above relief. But the position in the two countries is not on a strictly comparable basis. The English companies have accumulated reserves to stand by on occasions of periods of special risks and hazards. Moreover, under the English law the Marine accounts are not closed for a period of one year, but for periods of two years at a time on the basis that marine covers and claims take a longer time in the process of settlement. In respect of fire insurance also, the insurers are entitled to place before the authorities the special circumstances on the basis of which they claim higher allocations for reserve and the law is made flexible to allow such special claims wherever the basis and justification for such special treatment are supported by the circumstances of the case. It is, therefore, desirable that increased allocations for reserves of General Insurance companies should be recommended.

In the case of Life Insurance companies, there is also the demand often placed before the authorities that 100 per cent. of the adjusted surplus allocated for the benefit of the policyholders should be allowed as a deduction. The present position is that only 4/5ths of the surplus reserve for policyholders is so allowed. There is no justification for this restricted relief as the surplus really belongs to the policyholders although held by the company till the time of actual distribution.

The question of encouraging insurance companies to build up reserves against depreciation in value of their investments should be sympathetically considered. Any amount carried to such a reserve should be allowed, as a matter of course. The assessing authorities should not consider that the allowance should be dependent on the fact whether depreciation has actually taken place or not. It should also be made clear that if the depreciation is wiped out by a rise in value in a subsequent year within or after the same inter-valuation period, though in such a case if the subsequent appreciation has not been taken credit for in the accounts or in the actuarial balance sheet, the depreciation written off should be allowed and should not be subsequently adjusted.

Earlier we have already indicated our view that Mutual Insurance Associations should be placed on the same basis as Co-operative Societies for the purpose of tax liability.

We would here like to make some observations on the question of the tax liability of mutual associations although the same is not strictly covered by the question under discussion. For purposes of tax liability the accounts of mutual associations, working for the benefit of their members, are divided into two parts. The subscription income is treated as voluntary contributions from members and not liable to tax. The income derived by the association from other sources, viz., investments, property, etc., are made taxable. Hardships arise in the fact that the allocation of expenditure is not quite rational. In the case of many associations, a good part of the expenditure is met out of income from other sources, say, from property or from income from investments. Although the activity of the association as such is not treated as commercial by isolating the income derived by it from non-member sources, more tax is collected from such associations than would be the case if the overall position is taken. To illustrate the arbitrary nature of the working of the present arrangement, we would mention the instance of our Chamber. In the Chamber we are conducting a Monthly Journal. The Monthly Journal results in an annual loss of a fairly large sum, say, over Rs. 20,000. On the ground that the Journal is primarily intended for the members of the Chamber, this loss is treated as a non-commercial loss. At the same time, there is a small income of Rs. 5,000 or 6,000 by way of advertisements. This advertisement income is taken as commercial income and aggregated with the other commercial incomes for tax liability after allowing a small proportion for expenditure in the printing of advertisements. Even if the Journal as such is treated as an expenditure for membership, the overall financial result of the Journal is not being taken for computing the tax liability. The allocation of expenditure as between the taxable and non-taxable activities should be a little more realistic and adjusted to practical requirements of the case. The associations should also have the option to request the department to compute their tax liability

by the overall position, i.e., if the activities of the Association as such result in a deficit or in a smaller surplus, the assessment should be with reference to that overall position and not merely with reference to the balance of position calculated with reference to the commercial activities as such.

Question 83.—Do you think that differentiation should be made between distributed and undistributed profits of companies for tax purposes? If so, on what grounds? What change would you suggest in the present quantum of differentiation in favour of undistributed profits? Should the concession in future be restricted to particular industries?

If the tax concession in favour of undistributed profits is allowed to continue as at present or in a modified form, what measures would you suggest to ensure—

(a) that retained profits are not used as a device by shareholders of private limited companies to evade super-tax;

(b) that retained profits are actually applied for productive purposes?

In particular, are the provisions of Section 23A of the Income-tax Act satisfactory? If not, what changes would you suggest?

The differentiation in treatment as between distributed and undistributed profits of companies for tax purposes is justified. It encourages efforts to consolidate the position of the company and will help ploughing back part of the profits for purposes of expansion. In short, it is a recognised method of financing future requirements of capital. We would suggest that the amount of rebate may well be increased. It is at present one anna; the same may be increased to two annas. We are not in favour of the concession being restricted to a particular industry. It should be available in all cases of undistributed profits.

We do not consider that any special safeguards are necessary to ensure that retained profits are actually applied for productive purposes. If, however, Government wish to arm themselves with powers, it may be provided that if at any time retained profits are used in the process of distribution, or used for purposes other than that connected with, or are not ploughed back into, the activities of the companies, the same would be liable to taxation.

Regarding the anomalies resulting from the present provisions in Section 23A, we have already, earlier in our observations, made detailed suggestions.

Question 84.—Do you think, in view of the fact that profits distributed by a company are subjected to corporation tax, it is appropriate that they should also be charged to super-tax in the hands of shareholders? If not, what are your suggestions in this regard?

In the first place, we have recommended that the system of subjecting companies to two taxes under different nomenclatures should be discontinued. If corporation tax, however, is to continue as a separate levy, the dividend income which has already borne corporation tax should not be subject to super-tax in the hands of the shareholders.

Question 85.—Would you consider that industrial, commercial and similar other enterprises undertaken by the Centre, the States and Local Bodies should be required to contribute, from their earnings in the way of income-tax or in other ways, to general revenues?

The State is increasingly entering into spheres which were traditionally recognised in the past as meant for the citizen. In that process, the resources of the State are employed in competition with the resources of the citizen. Conditions of such competition, it is reasonable to suggest, should be even and equal, and in fields of such trading activities the State should not be entitled to any benefits of a special or concessional character. If State-owned business undertakings are exempt from the obligation to pay tax, it would mean that we are creating unequal conditions of competition. In a mixed economy, it is quite obvious that in the same sector there would be manufacturing or trading units owned by private enterprise as also by the State. While the concept that, as in the trading activities of the State, the element of profit-making is absent, the same should be entitled to tax-free consideration might have been deemed as reasonable in the past, in the existing context of affairs, under which the State is making incursions into the sphere of organised trading or manufacturing activity, there could be no longer any justification for continuing the exemption of profits of such activities from taxation. The inequity of any difference in the basis of treatment for taxation purposes is quite obvious and will lead to results of an undesirable character.

Such tax liability should not be confined to vocations when the commercial or industrial activities of the State are a separate structural unit under the framework of the Indian Companies Act or any other special legislation. The liability should accrue even where the State concerned carries on commercial activities, more or less, on a departmental basis. The State Governments are now operating large transport and other services. Some of the Governments have been actively carrying on day-to-day trade. Some such trading activity has resulted in large profits. It is but proper that in respect of such trading activities, the States concerned should be placed on a position of par in the matter of tax liability with private enterprise.

Evasion and Avoidance of Tax

Question 86.—*What measures would you suggest for the greater use of the services of Chartered Accountants for assisting in the determination of the taxable income of assessee? What obligations should be placed on a Chartered Accountant when he certifies a statement of accounts of an assessee for purposes of income-tax assessment? In particular with a view to minimising evasion of tax, would you recommend that the certificate of a Chartered Accountant should invariably accompany the return for business income over a certain limit? If so, would you suggest that a form of certificate should be prescribed indicating the scope of the check that should be exercised by Chartered Accountants who render the certificate mentioned above? Do you agree that fees payable by assessee to Chartered Accountants for such certificates should be restricted to a schedule to be prescribed by Government?*

Normally the accounts maintained and presented by the assessee should be accepted subject, of course, to the departmental verification. The use of the services of a Chartered Accountant for assisting the determination of taxable income of an assessee should be on an entirely optional basis. If the assessee chooses to enlist the services of a Chartered Accountant, then the account presented by the Accountant should be accepted as a matter of course. In cases where, having regard to the smallness of the income or other connected factors, the assessee does not think it feasible for him to enlist the services of a Chartered Accountant, such enlistment should not be enforced and the accounts produced by him, subject, of course, to such departmental scrutiny, should be accepted.

The question of standardising the certificate to be given by a Chartered Accountant along with the return may be examined in consultation with the Council of the Institute of Chartered Accountants of India.

Question 87.—*What changes would you suggest in the present law relating to the representation of assessee before Income-tax authorities (Section 61) in order to ensure—*

- (i) *effective representation of assessee at reasonable fees;*
- (ii) *a minimum level of proficiency on the part of representatives regarding the subject of income-tax law, rules and regulations?*

The Income-tax practitioners should be encouraged to form themselves into an effective organisation and to prescribe a code of conduct for the profession. In the case of the Accountancy profession Government have taken steps which have resulted in the professional activities being regulated under the guidance of a recognised Institute. Similarly, the accredited Association of the Income-tax Practitioners should be taken into confidence and through the aegis of the Association, Rules framed for governing the code of conduct for the Income-tax Practitioners. In Bombay there is the Chamber of Income-tax Consultants, representing collectively the Practitioners at this end. The feasibility of the formation of similar organisations at all income-tax centres and entrusting the Association with the work of enforcing and maintenance of proper standards by the practitioners may be considered.

Question 88.—*Will it assist in checking evasion if the names of the persons who are penalised for concealment of income are published?*

We are not in favour of the introduction of the practice of publishing the names of persons penalised for concealment of income. The main object of any such step is to hold the person to ridicule. Such a procedure smacks of a form of medievalism in inflicting punishment. Again, for the offence of concealment, the assessee concerned would be punished in terms of the provisions in the law, either by way of fine or imprisonment. Therefore, the publication of the names and the consequent ridicule would amount to the infliction of an additional punishment.

Question 89.—*Do you think that the present practice of excluding, from taxable profits, perquisites given to employees of business undertakings results in con-*

siderable loss of revenue? If so, please state the perquisites you have in mind, and how they should be dealt with for the purposes of taxation?

Normal perquisites given to employees in the shape of allowances for specific purposes should be excluded for computing tax liability of the employer, unless in cases where the Income-tax Officers have reason to believe that the allowances granted are disproportionate to the nature of the duties performed by the employee, and constituted a deliberate attempt to fritter away the resources of the employer and to reduce the tax liability. The assessing authority has adequate powers to go into the details of such allowances and to determine the quantum which could reasonably be allowed. Beyond that there should be no general provision for excluding all perquisites.

Question 90.—*In the case of a company under liquidation, what steps, if any, would you suggest for safeguarding payment of tax dues before any payments are made to shareholders?*

Under the law, as it stands, tax claims have always a prior or preferential claim in liquidation and bankruptcy proceedings. We do not think that a debt to the State should have priority over other preferential debts such as wages to workmen, labourers, rent, etc. In any case, no payment to shareholders, even under the existing law, is possible before all these preferential claims are met. No additional provision seems necessary.

Question 91.—*Do you think that, in order to minimise evasion and avoidance of tax, there is a case for conferring larger powers on income-tax authorities? If so, what further powers should be given to them? In particular, should powers to search premises and seize documents and books of accounts be given to Income-tax authorities? If so, what is the lowest grade of officer on whom you would confer these powers?*

We are of the considered view that the powers vested in the assessing authorities under the existing provisions of the Act are sufficient and adequate to prevent any avoidance of tax. Recently these powers have been added by provisions enabling enforcement of submission of a wealth statement under certain circumstances as also enabling the impounding of books of accounts of the assessee under certain circumstances. Even otherwise, there is a general feeling that the attitude of the assessing authorities towards the assessee calls for a reorientation. Powers to enter and search premises, seize documents and books of accounts should not be vested in the Income-tax machinery. It must be remembered that assessee are not criminals as nothing incriminating has been found against them. They should be entitled to the normal immunity enjoyed by the average citizen and if on suspicion or prejudicial information the Income-tax authorities enter the premises of an assessee and conduct a search, the information about such a development will do irreparable harm to the standing and credit of the assessee concerned and with all the emphasis at our command, we would submit that the Commission should discount the idea of such inquisitorial methods in income-tax proceedings and administration.

Question 92.—*What precautions are necessary and possible to prevent the creation of an artificial legal entity—a trust or a private limited company or a partnership, especially family partnership—either for avoiding payment of income-tax or for fractionating of income to escape higher rates? Would you recommend the use of penalty rates of tax to minimise such practices?*

A clear distinction must be made between evasion of tax and avoidance of tax. Evasion of tax arises when there is a deliberate attempt to defraud revenue; avoidance, on the other hand, is a process of adjustment of the financial affairs of the assessee in such a manner as to reduce tax liability within the framework of the provisions of the law. In a recent judgment of the Bombay High Court, the Chief Justice, Mr. M. C. Chagla, succinctly dealt with this aspect in the following words: "A citizen is perfectly entitled to exercise his ingenuity so to arrange his affairs as may make it possible for him legally and lawfully not to pay tax, and if his ingenuity succeeds, however reluctant the Court may be to acknowledge the cleverness of the assessee, the Court must give effect to the letter of the taxation law rather than strain that letter against the assessee." In another judgment, Chief Justice Sir John Beaumont gave his considered opinion: "Anyone is entitled so to conduct his affairs within the law as to avoid incidence of taxation, and if a man finds that he will suffer less in taxation by carrying on business in partnership with his mother rather than his wife, he is entitled to select his mother. But the partnership must be a genuine partnership." We submit, therefore, that the underlying presumption in the question is not justified. As long as the law otherwise permits it, it should be open to the assessee to create a Trust or

to form themselves into private limited companies or enter into partnerships in order to secure a reduction in the tax liability. There is nothing illegal or immoral about it. No special checks in the shape of penalty rates of tax to meet such a situation would be justified.

Recovery

Question 93.—*In the case of a registered firm, would you advocate recovery of unrealised tax of any partner from the firm as such or from other partners?*

In the case of a registered firm, under the existing provision and practice, tax liability does not attach to the firm as such but to the individual partners. The tax liability is also computed with reference not merely to the share of income from the partnership business as such but after aggregating the other income of the individual partners. There would be no justification to fix the liability on the firm for such liability is not merely with reference to the profits accruing from the business but will be dependent on the general liability of the partner as an assessee. On the same basis, there would be no justification to recover the tax dues of the defaulting partner from the remaining partners. Government should rely on the normal powers of enforcement vested in them by the provisions of the Act.

Question 94.—*Are present arrangements relating to recovery of income-tax adequate? Would you advocate the Income-tax Department having a separate machinery for enforcing the recovery of arrears of tax?*

We presume that in respect of tax deducted at source under the special provisions of the Act, the existing provisions and arrangements regarding recovery have not resulted in any difficulty. No change is called for in the same.

In regard to the recovery of arrears, the powers conferred at present are adequate and easily enforceable. On a certificate from the Income-tax Officer, the Collector of the area recovers the arrears as in the case of arrears of land revenue. No other legal formalities have to be completed. In the process of recovery, the Collector is entitled to sell all the assets of the assessee including movable property, distrain crops, cattle, life-stock, etc. The extreme method of enforcement of arrest and imprisonment is also not ruled out, except in the case of an assessee who is a lady. We do not think it is necessary for the Income-tax Department to have a separate machinery for enforcing recovery of tax dues.

Question 95.—*What provisions should be made to ensure timely collection of tax from private limited companies? Do you consider that liability for payment of tax in such cases should be placed upon shareholders of the company in proportion to their shareholding?*

Private limited companies are as much a legal entity as public limited companies. The principle of limited liability implied in any type of joint-stock undertaking equally operates in the sphere of private limited companies. The underlying idea is that an individual shareholder in a private limited company, as is the case for a shareholder in a public limited company, is liable only to the extent of his unpaid share capital. No other liability attaches to him personally in respect of the affairs of the company. This principle should not be violated by any exceptions made for purposes of the Income-tax Law.

Earlier we had suggested that in place of the present requirement regarding advance payment, a procedure under which the assessee pays the tax due on the basis of the return within three months after the submission of the return be introduced. If such a procedure is introduced, within a short time of the closing of the account period, the assessee would be obliged to pay his tax dues. Chances of loss on account of the present abnormal delays in completing assessments would be obviated and no other special precaution seems to be necessary.

Question 96.—*If income from any property is included for assessment purposes in the hands of a person other than the ostensible owner, would you agree to the tax so assessed being also made recoverable from such property?*

Income-tax is more or less in the nature of a personal liability and is not a liability attached to the property as such. It should be enforced against the person assessed.

General

Question 97.—*What concrete measures should be taken to improve the relations of the Income-tax Department with assessee, especially in regard to—*

(i) *provision of free advice to small assessee on the followings points:—*

(a) *maintenance of accounts in a form acceptable to the Income-tax Department; and*

(b) *matters such as filing returns of income, claiming refunds, facilities for tax payment, expeditious disposal of assessments, etc.;*

(ii) *provision of information on various matters relating to assessment proceedings, such as disposal of refund applications, adjournment applications, examination of records, etc.;*

(iii) *arrangement of work so as to obviate the necessity of assessee or their representatives having to wait in Income-tax Offices for unduly long periods; and*

(iv) *securing the largest measure of agreement on facts between the assessee and the department at Income-tax Officer level?*

The Commission should concentrate on efforts to improve the general relations between the Department and the assessee. This is an aspect which has caused good deal of concern and dissatisfaction in the past. Apart from creating good Public Relations machinery at each Income-tax Headquarters, which, among other things, will give free advice to assessee, assist them in maintaining accounts in proper form and assist them in the matter of discharging their formal obligations such as filing returns, claiming refund, etc., there should be created at each Income-tax Headquarters a High Power Advisory Body to whom aggrieved assessee could go to represent their grievances and difficulties. Besides the Commissioner of Income-tax and other departmental officials, the Advisory Body should include representatives of accredited associations. The knowledge that departmental action is likely to come up for review in such a manner would in itself have a salutary effect in not only increasing administrative efficiency but also in improving the relations between the Department and the public. The superior officers should be easily accessible to the average assessee and when they have any complaint or grievance against a subordinate, same should be looked into expeditiously and the apprehension that the audacity of the assessee in seeking to present the matter before the Commissioner would entail the wrath of the official and further resulting harassment should be removed. All Income-tax Officers should also undergo training in developing personal relationship and treatment of the public.

The arrangement for the reception of assessee in the Department should be improved. They should be treated in the same manner as a business firm would treat its constituents. After all, they are the main contributors to the revenues of the State on which the Department is sustained. Provision of adequate accommodation for sitting together with minimum amenities should receive greater attention. In the matter of appointments with Income-tax Officers, greater care should be taken to see that those called for interviews have not to wait indefinitely. The present practice of a chain of interviews on a particular day with the previous interview overlapping the time for the successive interviews should end. Interviews should be planned on a basis that assessee are not obliged to wait indefinitely. In any case, if it is found that an assessee called for interview could not be attended to immediately, he should be informed of the same and given choice of an alternate appointment on a subsequent day.

Question 98.—*What changes would you suggest in the existing arrangements relating to—*

(i) *issuance of notices;*

(ii) *simplification and filing of returns;*

(iii) *levy of penalties;*

(iv) *recovery of tax; and*

(v) *appellate procedure and machinery, particularly with reference to administrative control over Appellate Assistant Commissioners?*

(i) *Issue of notices.*—Notices issued should clearly indicate the requirements which the assessee is expected to fulfil. Omnibus demands should be avoided. Notices should also not be issued as a matter of course and in a routine manner. Only on occasions where any provision had to be complied with a formal notice should be deemed as necessary.

(ii) *Simplification and filing of returns.*—We have already indicated the need for simplifying the form of the return. In any case, for returns for personal income or for salaries, a simple form without all the details now included in the form should be evolved.

The request for extension of time for filing of returns should generally be favourably considered except where such requests are made repeatedly.

(iii) *Levy of penalties.*—The Income-tax Officers should be impressed to bear in mind the corrective aspect of penalty. Penalty should not be levied to the extent authorised by the law merely for the purpose of augmenting revenue. For offences of a technical

nature, the tendency to inflict penalty should be discouraged.

(iv) *Recovery of tax.*—Requests for time for payment of tax dues or facility of payment by instalments should normally be sympathetically considered. As mentioned earlier, when the tax demand is subject to an appeal, payment of the disputed portion of the tax should not be enforced. The present discretion to stay recovery is not being used to the benefit of the assessee and a specific legal right conferring such stay, except on occasions where the Income-tax Officer has reason to believe that the stay would result in frittering away of the assessee's tax resources, should be granted.

(v) *Appellate procedure and machinery.*—The appellate machinery should be completely divorced from the administrative side. The Appellate Assistant Commissioners should be removed from the control of the Commissioners and the Central Board of Revenue and placed under the Appellate Tribunal.

When a point has been decided in appeal, the Department should give the benefit of the decision for subsequent assessments instead of compelling the assessee to go in appeal on the same point. Similarly, benefit of the decision should also be extended to other assessee, where identical or similar points are involved.

There is another administrative aspect which has been the cause of bitter complaint. The frequent transfer of Officers results in considerable practical hardship to the assessee. When a new Appellate Official takes up a case left uncompleted by his predecessor, everything has to start *de novo*. When a case, therefore, has been taken up and heard by an Appellate Officer, he should not be transferred until such time as orders on the case are passed.

The proviso to sub-sec. (1) of Sec. 30 of the Indian Income-tax Act provides that no appeal shall lie against an order under sub-sec. (1) of Sec. 46, i.e., from an Order imposing a penalty, unless the tax has been paid. Very often, this provision creates great hardship in that the Appellate Assistant Commissioners before whom appeals from an order imposing penalty are filed, refuse to hear the appeals on the ground that the tax has not been paid. The provision should, therefore, be amended, and an appeal from an Order under Sec. 46(1) should be heard by the Appellate Assistant Commissioner and such hearing should not be conditional upon payment of the tax due.

Question 99.—(a) Do you think that undue delay occurs at present in the course of assessment proceedings? If so, what do you attribute this to and what are your suggestions for remedying this?

There is a general complaint that assessment proceedings are unduly delayed. One reason for the delay, it is understood, is that many times Income-tax Officers are reluctant to act on their own and have developed the practice of previous consultation with superiors, viz., Inspecting Assistant Commissioners, and deal with the matter only after obtaining their guidance. The assessment proceedings are the primary responsibility of the Income-tax Officers and they should not normally be encouraged to look to the Inspecting Assistant Commissioners for guidance in every case. Similarly, the Inspecting Assistant Commissioners should not interfere in day-to-day assessment work.

Another factor generally contributing to the delay is the practice of calling for a variety of documents and papers. The Income-tax Officer should *prima facie* satisfy himself about the correctness of the returns and should not be unduly punctilious about the submission of detailed mass of documents and papers.

The difficulty about transfer of Officers during the pendency of an assessment is another contributing factor. Instances have happened in the past when after an assessment had been under the scrutiny of an Income-tax Officer for a period of months there was a transfer, the entire proceedings having to start *de novo*. Here also, there should be a general practice under which a transfer should take effect only after the official concerned had disposed of the work actually in his hands.

To obviate delays, a system of check-up of progress of assessment may be introduced. If within a period of three months after the submission of return, the assessment in respect of an assessee is not completed, the Income-tax Officer should be under an obligation to submit a diary of delayed cases stating the reasons for such delay.

At present, an assessment has to be completed normally within four years. The period of four years is too long. It should be provided that if the assessment is not completed within two years from the date of submission of the return, same would be deemed as time-barred. Such a check would have a salutary effect.

Question 99.—(b) In order that delays of the kind mentioned above do not appreciably affect collection of a substantial portion of the tax due, should any special concessions be provided to assessee to induce them to make advance payment of tax?

We have expressed ourselves against the system of advance payment of tax. On the other hand, we have suggested that a procedure might be introduced under which the tax liability estimated on the basis of the return submitted by the assessee should be payable within three months from the date of the filing of the return.

Special Business Taxes

Question 100.—What, in your opinion, would be the circumstances which would justify the levy of Excess Profits Tax or special business taxes?

We are not in favour of the levy of special taxes like the Excess Profits Tax or special business taxes. The experience of the working of these taxes has confirmed us in our view that such forms of taxes are not desirable and suitable. In periods of excess profits, normally the Exchequer gets a larger share by way of income-tax. When a uniform and consolidated structure of taxation is evolved, all such special levies should not be attempted. In an emergency, there is provision for the levy of a surcharge on general rates of taxation, the proceeds accruing entirely for the Central Exchequer. Beyond such an additional levy, and that too strictly confined to meet the conditions of an emergency, there should be no additions to direct tax in the form of Excess Profits Tax or special business taxes.

Death Duties

Question 101.—What are your main reactions to the Estate Duty Bill at present before Parliament?

The Estate Duty Bill has since been passed by the Houses of Parliament. We had submitted a detailed Memorandum of our views and suggestions when the Bill was under discussion. We do not propose to cover the entire ground again for the purpose of the present Questionnaire. All that we would like to say is that in the context of the overwhelming need for assisting capital formation, the levy of this duty and at the rates now announced will have a depressing effect on new or increased economic activity. More than anything, we also fear that psychologically the Bill will encourage a tendency for dissipation of resources instead of assisting conservation of resources for developmental purposes.

Question 102.—Would you in the matter of rates of levy differentiate between self-acquired property forming the estate of a deceased and property inherited by him?

Obviously, when the Questionnaire was framed, perhaps, the Commission were under the impression that the Bill would not have become law before they had completed their recommendations. As the position stands at present, the rates structure has already been adopted and in the rates structure the distinction has not been recognised. However, viewed objectively, there is considerable force for introducing the distinction on the same analogy as the distinction for purposes of income-tax between earned income and unearned income. As, however, for the present, the discussion of the merits of such a distinction would be merely one of an academical character, we have no desire to pursue

PART III.—COMMODITY TAXES (CENTRAL & STATE).

CUSTOMS

The Indian Customs Tariff, like many other modern tariffs, is very complex. The system of levying duties on importation originated in this country in the year 1875. Temporarily between 1882 and 1894 no duties were levied. The financial exigencies, however, led to the reimposition of the Customs Duty in 1894. A brief historical survey of the growth of the tariff may not be out of place.

From 1894 till the period of the First World War, the general rate of import duty was 5 per cent. Cer-

tain items like Railway materials and machinery were free of duty. Items like liquor and tobacco, capable of yielding higher revenue, were subjected to higher rates. After the outbreak of the First World War, there were three important stages of increase in the rates, viz., in 1916, 1921 and 1922. In 1916 financial exigencies necessitated a general revision. The general rate was increased from 5 per cent. to 7½ per cent. and the duty-free list was also curtailed. The list of items bearing higher rates was added to.

In 1922 Government was confronted with a heavy deficit in the budgetary position and among other things, the general rate of import duty was further raised to 11 per cent. From that year onwards a schedule of luxury goods like motor-cars, silk goods, watches, etc., was introduced bearing duty at a higher percentage. The general rate was again increased from 11 per cent. to 15 per cent. in 1922. From that year onwards wide breaches were made also in the principle, which till then existed, of uniformity in rate with small exceptions.

In 1921 the first Fiscal Commission recommended a policy of discriminating protection. They also recommended the introduction, as a general principle, of exemption from duty of raw materials used in industries and low rates of duty on semi-manufactured goods entering processing activities. During the years following, a policy of discriminating protection was followed and two types of duties, viz., revenue and protective, were in force. Many duties that were protective in effect were important as producers of revenue also to the extent that the level of the levy was not high enough to shut out imports. Similarly, duties levied for revenue purposes, in most cases, furnished an incidental measure of protection. During the inter-war years, the country greatly reduced its dependence on foreign sources of supply in certain consumption articles such as cotton textiles, matches, soaps, sugar, iron and steel and a few chemicals. Thereafter, during the period of the Second World War, imports declined firstly due to non-availability of supplies and secondly due to restrictions necessitated by currency considerations. The cumulative effect was a drastic fall in revenue on account of customs.

Since customs duties had been an important source of Central revenue before the Second World War and since alternative sources were not adequate to meet the increasing demands on account of increasing expenditure, Government had to tap intensively customs duties by increasing the rates. In 1941 there were certain increases on specified items. In 1942 this was followed by an overall surcharge over the whole field of import duties to the extent of 1/5th of the rates in force. These steps resulted in increasing the yield, but it was only from 1944/45 that the revenue position recovered substantially as a consequence of freer flow of imports.

After the war, relief in respect of customs duty was given on certain items particularly on raw materials required for industry and on plant and machinery. The duty on the latter was reduced from 10 per cent. to 5 per cent. except in the case of certain items, in which corresponding locally manufactured plant and machinery required to be protected. In the post-war years, articles which are generally considered as luxury items were singled out for higher taxation with a view partly to discourage their consumption. In 1950 the general rate of duty stood at 30 per cent. There was a group of items selected for specially high duties, another group subjected to protective duties, and yet another group subjected to low duties and a few items entirely free. As a cross division of the revenue duties a group of items carried preference for the U.K. and other British Colonies.

The current import tariff schedule consists of 22 sections, incorporating over 520 items, all separately mentioned. Out of this, a group of 317 items is subjected to *ad valorem* duties and the rest are specific. Again 413 are revenue duties, 92 preferential and 128 protective. At present the general rate of duty stands at 31½ per cent. *ad valorem*. Concessions on the lines of the GATT are granted to 116 items. The internal classification of the tariff is on the basis of affinity or attributes. Goods are listed according to their stage of manufacture, viz., raw materials, finished goods, etc., or as to their derivations, viz., animal, vegetable, mineral products, etc., or in line with some other technical description or use.

The best way to study the justice or the effect of the import duties is to classify the taxed articles under four broad categories, viz., necessities, luxuries, raw materials and capital goods and to analyse and compare the proceeds from each class. Such a classification may not give a definite idea of the exact burden on the various income groups. Nevertheless, the broad picture given by this classification will be instructive.

The *de facto* burden of a tariff is measured by the ratio of yield of customs duties to the value of imports. Such a basis may not be helpful in giving a correct picture about the level or the height of the tariff, but is a rough indication of the effect of the tariff as a whole. The *de facto* burden before the years of depression, i.e., for the years 1926/27 to 1928/29 was estimated at 16.63 per cent.; during the years of depression, i.e., 1929/30 to 1933/34, the same was 26.8 per cent. In the period of recovery 1934 to 1936/37 it was 30.1 per cent. In the pre-war years 1937/38 to 1939/40 it was 26.4 per cent. In the war years 1940/41 to 1945/46 it was 31.9 per cent. In the post-war years 1948/49 to 1951/52 it has been estimated at 17.5 per cent.

The fact that the *de facto* burden has gone down notwithstanding the substantial increase in the general level and the increase in rates of import duty on many of the items goes to show that while the character and composition of our imports might have undergone substantial changes, the level of the tariff has not been such as to increase the overall burden. The obvious inference is that our imports have expanded in spheres in which the rates of duty are comparatively lower. In respect of those items on which the higher rates of duty were charged with the combined view of either restricting consumption and increasing revenue, the results achieved have been, perhaps, according to plan. While there may be a feeling of disappointment that the rates of duty on certain items in use by particular sectors importing the same are high, it cannot be contended that the present level of tariff has, taken as a whole, a regressive effect on the volume of imports. Similarly, the comparative position in regard to *de facto* burden also would lend support to the point of view that in the search for wider coverage or increased revenue the sphere of import duties offers reasonable possibilities.

The general consideration which should weigh in the matter of future adjustments in our import tariff should obviously be that raw materials required for our industries should invariably be free of import duty; semi-manufactured goods entering any such manufacture or imported for processing activities here should bear only nominal rates of duty. In cases where such raw materials or semi-finished articles are partly used for manufacturing purposes and partly for other purposes, a system of refund of duty in the case of users importing the same for manufacturing purposes should be introduced; in regard to import duty levied on raw materials used in manufactured goods where the levy, at the raw material stage, is dictated by wider considerations, there should, at any rate, be an arrangement under which refund of duty paid on the raw materials used in the finished products subsequently exported should, as a matter of course, be granted. The level and rate of import duty on items which are in the nature of essentials of life should be kept comparatively low. The present system of preferential rates in respect of imports from particular countries should be reviewed and no such concessional treatment should be allowed unless on the basis of a corresponding *quid pro quo*; where imports have to be restricted to reduce internal consumption, such checks should be by a combination of both quantitative control and levy of import duties so that such essential imports, as may be necessary, are not penalised by unduly high rate of import duty.

Export duties were an integral feature of our early tariff policy and were levied generally at a small *ad valorem* rate on most of the exports, certain articles being specifically exempt. Although the levy was mainly justified on grounds of revenue, the principle was regarded as unsound and a consistent policy of abolition of export duties was pursued from 1867 right up to 1916. In the period just before the First World War, export duty was levied only on one item, viz., rice. The need for additional revenue during and after the First World War led to a revival of taxes on exports. In 1916 jute and tea were brought within the purview of export duties and in 1919 tax was imposed on exports of hides and skins. The duty on hides and skins was intended as a measure of protection to the Tanning Industry to check exports in raw form.

Prior to the Second World War export duties of importance were levied by this country only on raw jute and jute goods. In the post-war period Government imposed duties on a number of articles with a view to bringing about an equilibrium between the internal prices and the export prices and with a view to having a share in the difference between the two prices for the State Exchequer. The market conditions in respect of commodities subjected to such export duties have, from time to time, been changing and our exports have been experiencing price resistance and severe competition from alternative sources of supply in foreign markets. It is, therefore, quite necessary that the whole question of export duties is considered afresh in the light of these changed conditions in world markets. In the words of the Export Promotion Committee "to rely on exports as a stable source of revenue is most unsafe and is, indeed, opposed to every canon of fiscal prudence".

Broadly speaking, therefore, export duties should normally be avoided except in cases where such a levy is considered desirable so as to discourage exports for purposes of conserving supplies for home consumption and except where we have a position of monopoly as suppliers to the world. Even in the latter case, possibilities of substitutes and the efforts of other countries to provide alternative sources of supply will have to be taken into account. The levy of export duty with a view to making available to the Exchequer a part of the margin represented by the wide divergence between the internal price and world price may have some

justification, but the experience of the working of such levies in the country has been far from happy. It has led to steps in the direction of chopping and changing the level of export duties which have met with adverse reactions in the buying markets. Moreover, Executive action, when the difference in the price level had narrowed, has not been timely, and in the result the country has been faced with the risk of loss of markets built up as a result of a good deal of pioneering efforts.

Import Duties

Question 103.—Do you think that any changes are necessary in the Indian Customs Tariff in respect of—

- (i) grouping of commodities;
- (ii) additions to and alterations in tariff items;
- (iii) correlation with the Import Trade Control Schedule;
- (iv) clarification in nomenclature and in units of measurements or weight?

(i) The present classification is based upon the grouping of articles on the lines of affinity or attributes. The structure of the tariff schedule underwent a major revision in the year 1935. As the present grouping follows mainly the general procedure adopted for purposes of the Customs nomenclature drawn up by the Expert Committee appointed by the League of Nations, it may be claimed that the existing basis of arrangement has the support of the views of international experts in the matter. It is also relevant to mention that as the public who have to make use of the tariff schedules have become fairly familiar with the present arrangement, there is no justification, at present, for disturbing the same.

(ii) There are cases of entries which, in the light of the subsequent changes in the pattern of our imports, need no longer be in the same elaborate manner. Cotton piece-goods is a case in point. This is described under different sub-heads. Items of articles, the imports of which are no longer substantial, may, perhaps, be grouped under more consolidated heads.

In order to make the reference to the schedule easier and clearer, a machinery should be set up in the Department of Commercial Intelligence for examining suggestions, from time to time, for additional heads. In the same manner, proposals, oftentimes made for splitting the existing heads into different sub-heads according to quality, origin, etc., may also be considered. These are matters of detail which would require adjustment from time to time.

(iii) Customs Schedule should be correlated with the Import Trade Control Schedule. Government had appointed a Special Officer to go into this aspect of the matter and make recommendations designed to achieve the necessary element of correlation. The officer in question had discussed the matter with representative organisations and detailed suggestions were made in connection therewith. The object should be that an importer should be able to readily understand and know the corresponding classification in the Customs schedule in respect of the items covered by the serial number for which he has received import permission. Such an understanding of the position is necessary to have a clear idea of the duty payable on the items allowed to be imported as also to avoid disputes with the Customs authorities that the import permission did not relate to a particular item in the tariff schedule.

In this connection, suggestions have been made that both the import control and the customs, for purposes of tariff, should work on a common schedule. This is not considered feasible for the obvious reason that the purposes of the two schedules are entirely different; for example, in the import control schedule, in the same item, break up under a number of heads will be necessary as the import policy in respect of each such sub-head would have to be separately decided with reference to the demand position and internal availability. While, therefore, an arrangement which would facilitate cross reference between the two schedules would be helpful, correlation in the sense of making the two schedules either inter-dependent or common may not be feasible.

(iv) Complaints have often been received about the difficulties experienced in regard to the differences in view in regard to the nomenclature used in the classification. What is important here is that a machinery should be set up for purposes of clarification at each port centre in which public element should be associated. There are at present Customs Advisory Committees functioning in ports. Difficulties in regard to classification and nomenclature should be referred to such committees and, from time to time, an attempt made to clarify the position in respect of items which have given rise to differences or disputes. The results of such clarification should thereafter be published in a suitable manner.

Question 104.—(i) What considerations should govern the fixation of rates of import duties for different

groups or sub-groups of commodities or for special tariff items?

- (ii) Have you any modification to propose in the present rates of duties in the light of the considerations suggested by you?
- (iii) Do you consider that import duties should be reduced in respect of any specific commodities in order to reduce the scope for smuggling?
- (iv) Are there any cases within your knowledge where duties on the constituent parts are higher than on the finished product? Is there adequate justification, in your opinion for this differentiation?
- (v) Do you think that owing to high rates of duties the yield on any commodity has reached the point of diminishing returns?

(i) The general considerations that should weigh in the fixation of the rates of import duties for different articles or groups of articles were dealt with in detail in our preliminary observations. We would like to supplement the same by only one observation regarding duties intended primarily for protective purposes. In calculating the quantum of protection, the margin should not merely be equated to the difference between the cost of manufacture in the country and the landed price of the competing product. There should be an additional margin to cover the element of consumers preference to foreign goods as a result of long use.

(ii) Bearing in mind the general considerations referred to above, requests received from trade or industrial associations representing specific branches for reduction in the rate of duty on articles in their respective spheres may be considered. Particularly in the sphere of machinery and apparatus, there appears to be scope for greater concessional treatment in the matter of the rate of duty. Items of machinery are generally means of increasing production in the country. A reduction in the rates would be an encouragement to efforts for greater production, except of course in regard to such machinery as is being manufactured in the country.

(iii) It is common knowledge that certain items bearing duty at comparatively higher rates have encouraged smuggling in order to avoid the incidence of the duty. Silk and artsilk piece-goods, fountain pens, watches, diamonds, etc., are common instances. Even when imports of some of the items are precluded under the Import Trade Control, reports are current that they are being smuggled across the land frontier. So smuggling will have to be treated effectively.

Question 105.—Is the relative use of *ad valorem* and specific duties in the Indian Customs Tariff satisfactory? If not, in what respects would you enlarge or restrict the scope of application of either, whether used singly or in combination?

Ad valorem duties fall with equal weight irrespective of grades or quality on a particular commodity when imported under varying grades of quality. In the event of price fluctuation also the burden of the duty remains the same. The *ad valorem* basis is easy to understand and facilitates comparisons of the height of a particular levy. The chief drawback, however, is in the matter of assessment of value for purposes of estimating the levy. For obvious reasons, these values cannot be precise as they have to be determined by the Customs officials. Complaints about the arbitrary nature of the fixation of values by the Appraising officials are common. The fact that the value would depend upon the Appraising officials' decision affords chances for questionable practices being used in securing a favourable decision, requires consideration.

From the point of view of administrative convenience specific duties have an advantage, in that the amount of the duty would not be in dispute and would remain fixed. At the same time, the incidence under the specific duty would be higher on the lower grade of the same article or group of articles. Duty is recovered without any reference to quality or value of the article. In the light of the different objectives served by the Indian Customs Tariff, viz., revenue, protective and a combination of both, the use of both the methods, or a combination of both, is necessary and unavoidable. In the case, however, of specific duties, gradations by splitting up the same item under different qualities or strength or places of origin may be helpful in relating the burden to a greater extent to the price factor.

Question 106.—(i) In what circumstances would you consider "tariff values" a satisfactory basis for assessment of import duties? (Section 22 of the Sea Customs Act).

- (ii) Are there any commodities to which you would extend the application of "tariff values"?
- (iii) What changes, if any, should be made in the procedure for determining "tariff values"?

(i) Fixation of tariff values in effect means the introduction of the basis of specific duty for a given period of time, viz., one year. The arrangement of prescribing

tariff value at the commencement of the year is found to be very convenient particularly in respect of items which are subject to frequent price fluctuations. It eliminates chances of dispute both between the importer and the Customs on the one hand, and between the importer and his constituents on the other. In making contracts for sale of imported supplies, the importer is in a better position under a system of tariff values because he can estimate accurately the exact amount of the duty payable, in advance, and give his price quotations to his buyers on the basis thereof.

(ii) Every year, at the time of the annual revision of tariff values, suggestions are being made in regard to the introduction of additional tariff value heads. These suggestions are also being discussed with the departmental officers at frequent intervals.

(iii) Under the present procedure the tariff value for the ensuing year is based on the average of the market value prevailing for the item in question for the previous period of 12 months. The chief drawback in such an arrangement is that when the prices show a continuous downward tendency, the fixation of the value on the basis of the previous average amounts to recovery of duty at a higher rate. Therefore, in arriving at the tariff value the price trend should be a determining factor and due consideration should be given to the same in fixing up the value. Again, in respect of an item for which tariff value is fixed and for which the grades or qualities differ widely, the tariff value head should be split up into a number of sub-heads so as to make it possible to fix separate values for each such sub-head related to the prices prevailing for the items under such sub-head. Sometimes, the sub-division on the above basis will have to be by reference to the country of origin from which the article is imported. Such an arrangement is in vogue, but it should be more extensively applied.

Question 107.—(i) What changes in your opinion are necessary in the present provision (section 30 of the Sea Customs Act) regarding the determination of 'real value' and why?

(ii) Would you suggest any specific measures to counter the evasion of import duties through deliberate under-valuation?

(iii) Have the methods of valuation in the Sea Customs Act proved satisfactory in relation to trade through the land customs border, especially on the Indo-Pakistan border? If not, have you any specific suggestions to make in this regard?

The General Agreement on Trade and Tariff, vide Article VII, has defined the basis of valuation that should be followed for customs purposes. The European Customs Union Study Group of Brussels has drawn up a definition of value for the purpose of the levy of duties. The definition in question is somewhat similar to the "real value" as defined under Section 30 of the Sea Customs Act. The International Chamber of Commerce has drawn attention to the defects and drawbacks in the international definition in their brochure on International Trade and Government Regulations. Whatever be the form of ultimate definition decided upon, it is of importance that in the actual process of administration and interpretation of the definition, the importing interests should not feel that they are being harassed. Unless there is reason to doubt the *bona fides* of a particular case, the value as quoted in the invoice should normally be accepted. We are not over-looking the possibility of collusive arrangements between the exporter at the other end and the importer here. But such exceptional cases which *prima facie* give rise to doubts can be more closely looked into.

Question 108.—What changes would you suggest in the matter of granting exemptions from, or reductions in, import duties especially in regard to:

- (1) raw materials used for essential industries;
- (2) materials used for scientific research;
- (3) materials imported for charitable and humanitarian purposes;
- (4) materials imported for stimulating desirable activities, such as agricultural development; and
- (5) necessities of life?

(1) Government have the necessary power to grant exemptions or reductions in import duty on raw materials used for essential industries. These powers should be used very liberally. Perhaps, a general procedure may be introduced under which applications for concessional treatment in this respect are scrutinised by the Tariff Commission departmentally, the recommendations of the Tariff Commission being, as a matter of course, acted upon.

(2) Government have, earlier this year, by a press-note announced their intention to grant such exemption. It would, however, appear that the concession is intended for research in institutes sponsored by

Government or semi-Government bodies. It is relevant to point out that there are private institutions run for the purpose of promoting research. There are also research units attached to private industries. The concession should be equally available in such cases also.

(3) The grant of duty-free concession for materials imported for charitable and humanitarian purposes should be considered on merits of each case. Medical needs in case of epidemics of widespread diseases should, as a matter of course, be assisted by duty-free imports.

(5) We have already dealt with in our preliminary observations the general basis governing the levy of duty on necessities of life.

Question 109.—To what extent do you think revenue might be sacrificed in the interests of bilateral or multilateral fiscal arrangements such as GATT or the preferences in favour of certain Commonwealth countries?

It is difficult to estimate the effect on revenue or the balance of advantage resulting to the country as a result of the concessional arrangement, under the bilateral or multilateral agreements, in force. The Fiscal Commission went into the matter, but refrained from giving an estimate of the ultimate financial effect. So far as the Commonwealth preferences are concerned, the general feeling is that the arrangement has outlived its utility. The position will have to be considered *de novo*. In the matter of the GATT, as the Indian representatives have taken a direct part in negotiating these concessions, the desirability or otherwise of continuing the same should not be determined merely by reference to the balance of financial effect. In the context of the place and position of India as an active participant in international arrangements, such agreements need not be objected to so long as the concessions do not relate to products in respect of which a claim for protection is likely to be made by the country in the immediate future and do not result in excessive loss of revenue. Under the GATT India has received many direct or indirect concessions on some of its items of export. It has also granted concessions on a number of imports. The Fiscal Commission (1950) formulated certain basic ideas for the purpose of tariff negotiations. Firstly, in regard to tariff concessions to be received from other countries, India should concentrate on commodities which meet with competition from similar commodities from other countries in the world market and on commodities which meet with competition from possible substitutes from other countries in the world market and on manufactured goods rather than on raw materials. In the matter of granting tariff concessions, India should concentrate on capital goods, other machinery and equipment and essential raw materials. Our future agreements, both bilateral and multilateral, should be governed by the above criteria.

Question 110.—Under what circumstances should customs duties be used in preference to import quotas as a means of restricting imports?

Where the restriction in the volume of imports is necessary from the point of view of stimulating the growth or development of an industry in the country, the same should be achieved more by the levy of customs duties at adequate levels than by import quotas, unless of course to meet the requirements in a particular case a combination of both is considered desirable. Similarly, where the restriction of import is with a view to reduce consumption of certain articles or groups of articles, the results should be achieved by the levy of customs duties at appropriate levels. On occasions, however, when regulation of imports is necessary with a view mainly to conserve foreign exchange resources, quantitative controls would be preferable, for such imports as are necessary in the items controlled would not be penalised by a high level of duty. There would obviously be cases in which, although for larger reasons of policy the volume of imports have to be restricted, yet some quantity to the extent of meeting the essential needs will have to be allowed. In such cases, if the restriction is attempted by a high level of duty, the quantum required to be imported for essential purposes will bear an avoidable burden.

Question 111.—In what respects should the present law regarding "drawbacks" and "warehousing" be altered in order to assist the export trade in manufactured goods which involve the use of imported raw materials?

The Bill, at present before the Parliament, seeking to amend the Sea Customs Act would empower Government to allow drawback in respect of import duty paid on materials subsequently re-exported either in the same form or after processing. The main point to be emphasized is that drawback to the full extent of the duty actually paid should be available on such re-exportation and the formalities prescribed for the purpose of claiming such drawback should be simple. In addition, the question of the introduction of free zones,

where materials required for processing could be imported without payment of duty on the basis that the processed goods would be re-exported, has been under discussion for some time. The proposal did not evoke much public support because the same was considered with reference to only one port. The feasibility of a proposal under which free zones could be created at each port centre, where duty-free imports may be allowed, facilitating processing activities, may be examined.

Question 112.—Have you any suggestion to make regarding the administration of the Sea and Land Customs Acts, especially in regard to—

- (a) facilities for settlement of disputes arising out of appraisement; and
- (b) penalties imposed under the Act and the appellate procedure relating to them?

(a) Disputes arising out of appraisement are at present heard and decided by the officials of the Customs, viz., the Assistant Collector and the Collector. The possibility of some machinery in the shape of a Board for hearing such disputes at each port centre may be examined. Against the decision of the Collector of Customs, there is an appeal provided to the Central Board of Revenue. If a party feels aggrieved against the decision of the Central Board of Revenue, there is no appeal to a judicial authority except on matters of law. An appeal against the decisions of the Central Board of Revenue to an appropriate judicial authority may be provided.

Export Duties

Question 113.—Under what circumstances, in your opinion should export duties be imposed?

The general considerations which should weigh in the matter of levy of export duties have been dealt with in detail in our preliminary observations.

Question 114.—What measures would you suggest to achieve greater flexibility in the rates of duties to accord with the changing conditions of export markets?

Government have recently been empowered with powers to vary the duties to meet the situation arising out of price fluctuations in the export markets. Decisions regarding reduction or removal of export duties should be taken expeditiously and in time. The past experience has been that oftentimes the decisions taken are too late to achieve the purpose in view, with the consequence that the country is faced with the risk of permanent loss of markets as a result of encroachments made by competitors during the intervening period. In order to ensure that action in the direction of variation in the rates of duties is taken in time, we suggest the creation of a separate machinery with which non-officials should be associated for the purpose. Perhaps, the requirement could be met by empowering Port Export Advisory Committees to make recommendations for being placed before the appropriate Department of the Ministry regarding changes necessary in the rates of duty from the point of view of the effect of the prevailing rates on our overseas trade. Such recommendations should be immediately considered and wherever necessary acted on by Government.

Question 115.—Would you suggest that the whole or a part of the receipts from certain export duties should be funded for financing schemes for promoting long-range development of the export trade, subject to the obligations under GATT?

In the context of the emergence of increased competition, a purposive programme of assistance for stimulating exports is indicated. Among other things, a portion of the proceeds of the export duties may be earmarked for financing market research and for promoting schemes for development of export trade. The proportion thus reserved for expenditure on developing exports should be adequate to permit of export subsidies also being considered on occasions when such assistance is necessary for securing entry for our export products in a new market and for enabling them to withstand periods of abnormal competition.

Question 116.—Would you, in the interests of revenue or from any other point of view, recommend increased participation by the State in import and export trade? If so, what form do you think should such participation take?

We are strongly opposed to the State participating, directly or indirectly, in import and export trade. Our objections are two-fold: In the first place, we are not in favour of State Trading in any form, as in our opinion, State Trading is the very negation of the basic idea of freedom and equality of opportunity, which is the sheet-anchor of private enterprise. Secondly, from practical considerations, the State organisation is not at all suited for undertaking the responsibilities of and obligations involved in trading activities, more so in

the sphere of overseas trade. A State organisation built or set up for trade purposes cannot but be subject to political interference, which would impair the efficiency of any trading activity. Moreover, lack of personal interest and the fear of public criticism will always prove to be stumbling blocks against those in charge of a trade unit sponsored by the State taking quick and correct decisions. An officer in charge of a State undertaking would have to explain everything in a political way. The head of a private organisation can take quick decisions on his own responsibility. Risk taking and risk bearing are natural elements in the organisation and conduct of business under modern conditions, and with the emergence of keen competition they are all the more important in spheres connected with overseas trade. A State-sponsored organisation would be very reluctant to undertake these normal trade risks. Excessive reliance on safety-first principles would make a State undertaking grossly lacking in that energising element, which would strive to secure improvements in marketing methods that alone will enable the country to have increased and expanding markets for its manufactures. In the field of international trade, the sellers' market has almost ceased to exist. There is the general emergence of the buyer being able to dictate terms. Competition naturally would become keener, and the days when buyers would knock at the doors of the sellers and ask for their requirements are gone. By a process of exploration, by the search for new pastures, by a desire to meet the demands and tastes of the foreign consumers and by a studied and systematic effort to get a hold on the limited markets, for which there would be a great scramble, because of efforts and schemes for self-sufficiency everywhere, the country would have to nurse and nurture its overseas trade, particularly in finding export markets in the years to come. We venture to submit that for work of the above character, involving as it does a high degree of personal adaptability, a State organisation uninfluenced by the profit or personal success motive would be entirely ill-suited. It must also not be ignored that loss of a State undertaking would result in a national loss. An individual trading on his own account would naturally make every effort to cut down losses, as continuous losses to him would mean his personal ruin.

CENTRAL EXCISES

Excise as a source of revenue, was, in the earlier periods, used only during periods of financial stress. Otherwise, the levy was mainly intended for the purpose of introducing a regressive effect on the consumption of certain items like Drink or Tobacco. The general objection to the use of excise as a commodity taxation is that it singles out particular items or groups of items for special taxation which do not fall generally on other sectors. Where, however, the levy does not result in untaxed competition from outside sources or from substitutes within, the levy within reasonable rates and on a selected list of commodities, as a revenue earner, cannot be seriously objected to. The chief problem for decision however, is the selection of the items for purposes of the levy. The choice would be between imposing a tax on a large number of goods with relatively low rates, or confining it to a selective list in which the volume of turnover is large and the demand fairly inelastic. Even then, if the item is an essential of life, public sentiment, notwithstanding the tax incidence being comparatively low, would express itself against such a levy. The Fiscal Commission of 1921-22 laid down certain criteria in regard to the circumstances under which the levy of excise would be justified. According to the Commission (i) Excise duties should be ordinarily confined to industries which are concentrated in large factories or small areas; (ii) they may properly be imposed for the purpose of checking the consumption of injurious articles and especially on luxuries coming under this category; (iii) otherwise, they should be imposed for revenue purposes only; (iv) while permissible on commodities of general consumption they should not press too heavily on the poorer classes, and (v) when an industry requires protection and a consumption tax is also required from the produce of that industry in the interest of the revenue, the necessary amount of excise is unobjectionable, provided that it is accompanied by an import duty equal to the excise duty, together with the necessary protective duty plus a small extra duty to compensate for the administrative inconveniences to the manufacturer caused by the excise duty. In order to secure a greater coverage through indirect taxation so as to reach those sections of the community who do not contribute their share through direct taxation, the use of excise duty, as a tax source, can be justified if the articles selected for the purpose of the levy are of general consumption and the rate or rates of the levy are not such as to produce a regressive effect on consumption. Most of the commodities of general consumption in India are of the nature of necessities of life rather than luxuries and, therefore, particular care has to be taken in fixing the rate for the purpose of the levy.

Question 117.—Do you regard as satisfactory the present selection of commodities for purposes of levying excise duties? If not, what changes would you suggest and why?

In the sphere of Central Excise, excise duties are levied on kerosene, matches and mechanical lighters, motor spirit, salt, silver, steel ingots, sugar, tobacco, tyres, vegetable products, cloth, coffee and tea. There are also special excise duties on coal and coke, copra, oil crushed in mills and rubber. In addition, the States are entitled to levy excise duty on alcoholic liquors, narcotic drugs and spirituous medicinal and toilet preparations. In the light of the tests of suitability suggested by the Fiscal Commission, perhaps, the selection of articles for the purpose of excise duty cannot be objected to barring one or two items, but the same cannot be said about the rates at which the duties are levied particularly in respect of certain items. The levy of excise duty on steel which is an essential raw material for a number of industries is an instance in point.

Question 118.—(i) Have you any changes to suggest in the present rates of excise duties?

(ii) Are the provisions regarding valuation satisfactory where ad valorem excise duties are levied?

The high rates of excise duty on cloth are already proving to have a deterrent effect on consumption. In the same manner, the rates in force for motor spirit and tobacco have been the subject of frequent complaints. In the case of motor spirit the existence of a countervailing import duty might be considered as an extenuating factor. So far as tobacco is concerned, the grievance is more on account of the rate having been made steeper by successive changes within a short period of years.

We have not had serious complaints in regard to the basis of valuation where excise duties are levied on ad valorem basis.

Question 119.—Do you think that the differential rates of duty on different types of unmanufactured tobacco, other than flue-cured, should be replaced by a uniform rate of duty? Have you any other suggestions regarding the tobacco excise tariff?

The tobacco interests have expressed themselves strongly against the existing basis of differential rates of duty depending upon the capability of the tobacco being used for more than one purpose. The chief drawback of that basis is that there is room for a good deal of administrative arbitrariness and the consequent harassment of the trader. On the other hand, the introduction of a uniform rate of duty—at a rate sufficient to yield the expected revenue,—would, besides eliminating the difficulties complained of in the process of administration, encourage the use of better quality tobacco. In particular, the trade strongly feels that after payment of a uniform rate of duty at the unmanufactured stage, there should not be any further formality in connection with the taxation of this item.

Question 120.—Do you think that the lower rate of duty on the cottage match industry has been helpful to its development? If not, would you suggest any change in the existing rates of duties?

A lower rate of duty on matches produced on a cottage industry basis does not appear to have been helpful in assisting the cottage industry to consolidate its position. Other forms of assistance will have to be considered for the purpose of strengthening this industry.

Question 121.—Do you think that the arrangements for the assessment and collection of excises in respect of manufactured and unmanufactured commodities require simplification? In particular, please comment on the present system as regards

(a) licensing,

(b) warehousing, and

(c) transport

of excisable commodities.

The sugar interests particularly have often complained about the practical hardships resulting from the existing arrangements regulating warehousing and transport in the enforcement of the requirements in regard to excise. The detailed aspects of these hardships, we understand, are being placed before the Commission by the interests concerned.

Question 122.—Do you agree that a part of the proceeds of excise duties may be earmarked for expenditure on research and development schemes designed to improve the quality and marketability of the commodities?

The excise duty is mainly levied for the purpose of revenue and the proceeds should normally go towards strengthening the overall budgetary position. It is not proper to earmark the proceeds of excise duties for expenditure on research and development unless the benefit from such efforts accrues exclusively to the

advantage of the industry or the commodity paying the excise. In particular, the levy of an excise duty on one industry for strengthening or assisting another industry is open to objection, the more so when the products of the assisted industry are competing directly or indirectly with the products of the industry paying the levy.

Question 123.—Do you think that the imposition of excise duties has affected adversely the development of industries producing excisable commodities, e.g., their size and competitive capacity in export markets?

The levy of excise duty will affect the competitive capacity of industries in export markets. But the provision for grant of rebate in respect of excisable goods exported somewhat mitigates the position. However, the procedure and formalities connected with the grant of rebate should be simplified and arrangements should be made whereby the rebate is obtainable as a matter of routine and almost immediately after the exports have taken place.

SALT DUTY

Question 124.—Would you recommend the re-imposition of the excise duty on salt? If so, on what conditions?

From the point of view of taxation principles and objectives, the salt tax is a form of taxation which would readily commend itself. In the first place, salt is a commodity in everyday use by the common man. On that basis, a levy, even at a small rate, would, in aggregate, fetch a substantial revenue. It cannot be said that the abolition of the salt tax has led to an improvement in the purchasing power of the people who have been relieved of the burden of this levy. The Taxation Enquiry Committee had estimated the burden per head per month at nine pies on the basis of the average consumption of half-a-seer per month at the then existing level of duty. At the same time, it must be realised that the issue is not free from certain sentimental aspects. It is, in this connection, relevant to point out that the abolition of the Salt Duty has not resulted in the increased availability of cheap salt of good quality all over the country. The feeling is justified that in the present context of the need for additional source of revenue, the incidence of which will be spread widely, the Salt Tax may not meet with any serious opposition.

GENERAL OBSERVATIONS ON SALES TAX

Importance of Sales Tax in the Taxation Structure of the States in India :

Sales tax as an important source of revenue has been comparatively of a recent origin in India. It was first introduced in India prior to the war in two Provinces, namely, Madras and Bombay, with the object of making good the loss in revenue as a result of the adoption of the policy of prohibition. Whereas, however, in Madras the sales tax was of a general application, in Bombay, when it was introduced, it had only a limited application, the tax being levied and collected only on certain specified articles. During and after the war, the remaining Provinces, one after the other, resorted to this impost with the object of finding additional revenue required by them among other things, for financing their reconstruction and development programmes. By now, sales tax is in force in almost all the States in the Indian Union, including some of the Part "C" States. In some of the States like Bombay and Madras, it has been the largest single source of revenue. The former derived therefrom a revenue of Rs. 10.61 crores in 1952-53, which worked out to approximately 29.11 per cent. of its total tax revenue. As far as the sales tax proceeds of all the Part "A" States are concerned, the same amount to Rs. 43.87 crores which works out to 18.73 per cent. of their total tax revenues of Rs. 234 crores. As regards Part "B" States, the yield from sales tax amounted to Rs. 7.10 crores representing 10.51 per cent. of the total tax revenue of these States of Rs. 67.54 crores.

Disparities in the Sales Tax Legislations of the different States :

The development of sales tax as a major source of revenue in the taxation structure of the States has, however, not taken a scientific and rational basis. This explains the lack of uniformity in the sales tax policies and administration followed in the different States. The sales tax policies of the different States were largely governed by the sole consideration of revenue. Each State tried to exploit this new elastic form of taxation for collecting as much revenue as possible. In their anxiety to make full use of this impost, they were oblivious to the effects of their sales tax policies on the economy of the country as a whole. The effects have been on the whole very deleterious on trade, commerce and industry of the country. The existence of numerous rates, the adoption of different bases by different States for the levy and collection of tax, the divergent

policies followed in regard to the application of tax on particular commodities or groups of commodities, the imposition of sales tax on the same transaction by more than one Sales Tax Authority, the procedure and formalities laid down for the levy and collection of the tax and other disparities in the sales tax legislations have affected the economy of the country very adversely. The incidence of sales tax being quite substantial, the potentialities of this tax being a great handicap in the regional distribution of the country's trade and industry on a planned and scientific basis cannot be ignored altogether.

Difference in basis of the levy :

The disparities in the sales tax policies followed by the various States are many. In the first place, the very basis of the collection and recovery of the sales tax is different from State to State. Whereas in certain States, the tax is collected on the basis of single point, in certain other States, the same is collected on the multi-point basis. Again, in certain States mixed bases are found. For instance, in the State of Bombay, under the Sales Tax Act as it exists at present, although broadly speaking the system is mainly multi-point, in regard to certain articles two-point system has been adopted, under which the tax is collected at the first and last stage in the series of transactions.

Dissimilarities in Rates :

Dissimilarities in rates are also conspicuously observed in the sales tax legislations of the various States. The rates generally vary from 6 pies in the rupee in certain States like Bengal, Assam and Delhi to 3 pies in the rupee in other States like Bombay, Uttar Pradesh, Madras, Orissa and Travancore-Cochin. Further, two sets of rates are levied in some of the States. States like Bombay, Madras, Madhya Pradesh, Assam levy two sets of rates side by side, viz., ordinary rate applicable to the sale of all goods and the special rate applicable to what are called 'luxury goods'. Again, whereas in East Punjab the rates are left to be fixed by Government, in Bihar, the same are laid down from year to year by the Annual Finance Act. In Madhya Bharat the Act only lays down the maximum and minimum rates, leaving it to the Executive Authority to fix the annual rates from time to time.

Disparity in turnover limit :

Another point of disparity is in respect of fixation of turnover limits for the liability to tax and registration for the purpose. In some of the States two turnover limits are fixed for the various kinds of dealers, a lower limit being fixed in the case of manufacturers, processors and importers and a higher limit in the case of dealers other than manufacturers and processors; in other States the same turnover limit applies to all kinds of dealers. The turnover fixed for importers and manufacturers and processors is generally Rs. 10,000, although in a few States it is Rs. 5,000. The turnover in the case of other dealers varies between Rs. 5,000 and Rs. 30,000.

Divergence in policy in regard to exemptions :

Divergence in policies is also noticeable in respect of exemptions from the sales tax levy. Whereas in certain States industrial raw materials like cotton, coal, iron and steel are taxed, they are exempt in other States. Again, while supplies made to Government Departments and Public Utility Undertakings are free of tax in some States they are liable to tax in other States.

Need for Uniformity :

The disparities in the sales tax policies followed by different States as above and the harmful effects of the same on the economy of the country as a whole emphasize the need for steps being taken to bring about as large a measure of uniformity in the sales tax policies as possible. As a matter of fact, the question of uniformity in sales tax policies has been engaging the attention of the Government of India for the last more than five or six years. This question was discussed at several important Conferences such as for instance the Finance Ministers' Conference held under the auspices of the Central Government. Various suggestions and proposals made at the Conference were discussed and considered but so far these discussions have not brought about any tangible results in the direction of uniformity in the sales tax policies. One main reason for this state of affairs is the reluctance on the part of some of the States to surrender their right of making such changes and modifications in the sales tax policies as would be necessary for getting the revenue required by those States from this flexible measure of tax.

It is significant to note here that a suggestion was made at the Industries Conference, which was held in the year 1947, that the Central Government should collect the tax on a uniform basis and distribute the proceeds therefrom to the States on some agreed formula. Under the Constitution, sales tax is a sub-

ject coming within the competence of the States and it is, therefore, only the States who can legislate in respect of this levy. The centralisation of the tax would, therefore, necessitate the amendment of the Constitution. It is, however, a moot point whether in view of the anxiety of the States to retain this source of revenue within their exclusive jurisdiction, the States would be agreeable to the suggestion of amending the Constitution so as to enable the Centre to legislate for the levy of tax on the sale or purchase of goods in the various States. Looking at the question from the practical stand-point, therefore, it may be suggested that sales tax may be allowed to be continued as a State levy but that an attempt should be made to bring about a maximum degree of uniformity in regard to the major aspects of the sales tax policies followed by the different States. In this, a large amount of responsibility rests on the Union Government and it is upto them to take the necessary initiative in the matter. There are certain aspects of sales tax on which uniformity is greatly desirable from the point of view of maintaining the economic cohesion of the country and avoiding the harmful effects of the divergent policies followed by the various States.

As a matter of fact, with the advent of the new Constitution, uniformity was expected in respect of two important aspects of sales tax, viz., list of exemptions and the transactions in the course of inter-State trade and commerce. In actual practice, however, these expectations have not been realised.

Exemptions :

Clause (3) of Article 286 of the Constitution lays down that "no law made by the Legislature of a State imposing or authorising the imposition of a tax on the sale or purchase of any goods as have been declared by Parliament to be essential for the life of the community should have effect unless it has been reserved for the consent of the President and has received his assent". Although the necessary legislation under this provision of the Constitution has been passed by the Central Government, the much desired uniformity in regard to exemptions has not been achieved. It is so because the Central Legislation, viz., the Essential Goods (Declaration and Regulation of Tax on Sales or Purchase) Act contains a provision whereby the prohibition provided in the Act on the powers of the State Governments to levy sales tax on the essential articles does not apply in the case of levies which were already existing prior to the passing of the Act. It will thus be seen that the States which were levying sales tax on the 'essential articles' immediately before the passing of the Act have been allowed to continue those levies in spite of the fact that the goods in question are of an essential nature. This provision has seriously detracted from the value of the above central measure as a useful instrument for bringing about uniformity in regard to an important aspect of sales tax.

Inter-State Transactions :

As regards inter State transactions, it was expected that with the coming into force of the new Constitution, the perplexities and confusion created by the divergent policies followed by the various State Governments in regard to the levy of tax on transactions of an inter-State character would come to an end. In actual practice, however, the confusion has been worse confounded. The provisions of the first two clauses of Article 286 of the Constitution are as under:

"286 (1) No law of a State shall impose, or authorise the imposition of a tax on the sale or purchase of goods where such sale or purchase takes place (a) outside the State: or (b) in the course of the import of the goods into, or export of the goods out of, the territory of India.

Explanation.—For the purpose of sub-clause (a), a sale or purchase shall be deemed to have taken place in the State in which the goods have actually been delivered as a direct result of such sale or purchase for the purpose of consumption in that State, notwithstanding the fact that under the general law relating to sale of goods the property in the goods has by reason of such sale or purchase passed in another State.

(2) Except in so far as Parliament may by law otherwise provide, no law of a State shall impose, or authorise the imposition of, a tax on the sale or purchase of any goods where such sale or purchase takes place in the course of inter-State trade or commerce:

Provided that President may by order direct that any tax on the sale or purchase of goods which was being lawfully levied by the Government of any State immediately before the commencement of this constitution shall, notwithstanding that the imposition of such tax is contrary to the provisions of this clause, continue to be levied until the thirty-first day of March 1951."

The Article seeks to restrict the powers of the State Governments to levy tax on the sale or purchase of

goods where such sale or purchase takes place outside the State concerned or in the course of import of the goods into or their export outside the country. The Article also seeks to prohibit the State Governments from levying purchase or sales tax on transactions in the course of Inter-State trade and commerce. The provisions in question are, however, so clumsily worded that they have lent themselves to varying interpretations with the result that different State Governments interpreted them in such a manner that the levy of sales tax on inter-State transactions has continued in some form or other. This led to unnecessary controversy and litigation causing inconvenience and hardship to the merchants and traders who are engaged in such transactions.

The legal position of inter-State transactions *vis-a-vis* the Constitution has now been finally decided by the Supreme Court in their judgment in the Bombay Sales Tax Case. The Supreme Court has decided that Article 286(1) (a) read with Explanation thereunder prohibits tax on sales or purchases involving inter-State elements by all States except the State in which the goods are delivered for purposes of consumption therein. In other words, as regards inter-State transactions, the Supreme Court is of the opinion that it is only the State in which goods are actually delivered for the purpose of consumption therein is competent to levy sales tax on such transactions to the exclusion of all other States. Thus, for instance, if a merchant in Bengal delivers goods to a merchant in Bombay for the purpose of consumption in Bombay, as a direct result of the sale, the Government of Bombay is only competent to levy sales tax on these transactions. Although this Supreme Court decision has clarified the position of sales tax in regard to inter-State transactions, it has created a number of difficulties of a practical nature. Following the judgment of the Supreme Court, various State Governments have served Notices on the dealers in other States supplying goods to the parties in their own State calling upon them to produce their books of account relating to their sales to the parties in their own States and to pay the tax under their own sales tax legislations on the same. This has caused great deal of hardship and inconvenience to the mercantile community. In the first place, if the sales tax law of one State is made applicable to the dealers residing in other States, it would mean that the latter will have to be thoroughly conversant with the sales tax laws of all the States to which they are supplying goods and keep themselves informed of the changes that are made thereunder from time to time in order to ascertain their exact liability under the sales tax legislations of the States concerned. As a matter of fact the commercial community is finding it difficult to observe the formalities laid down under the Sales Tax Act of the State in which their places of business are located. If they are simultaneously brought with the purview of a number of sales tax laws, it would greatly add to their hardship and inconvenience.

Secondly, the other implication of the applicability of the sales tax legislation of one State to outside dealers would mean that they will have to submit their account books before the Sales Tax Authorities of not only various States but of different areas in all those States. Again, the dealers will have to keep and maintain their accounts in a manner required by the sales tax laws of the various States. This will particularly inflict a great hardship on the dealers.

Sales Tax on Exports :

As will be seen from the provisions of Article 286 quoted above, the Constitution seeks to restrict the powers of the State Governments in regard to the levy and collection of sales tax on the sale or purchase of goods, where such sale or purchase takes place in the course of import of the goods into or export out of India. The exact implications of these provisions were the subject-matter of a judgment given sometime back by the Supreme Court, in the appeal preferred by the United State of Travancore & Cochin from the judgment given by the Travancore-Cochin High Court in what are called "Cashew-nut Cases". The Supreme Court came to the conclusion that the implications of the provisions in question are as follows:

- (1) Sales by export and purchases by import fall within the exemption provided for under Article 286 (1) (b) of the Constitution.
- (2) Purchases in the State by the exporter for the purpose of export as well as sales in the State by the importer after the goods have crossed the Customs Frontier are not within the exemption.
- (3) Sales in the State by the exporter or the importer by transfer of shipping documents

while the goods are beyond the Customs Frontier are within the exemption assuming that the States' power of taxation extends to such transactions.

It will thus be seen that in terms of the judgment of the Supreme Court sales by a manufacturer or supplier of goods to an exporter for the purpose of exports outside the country prior to such export does not fall within the exemption provided for in Article 286 of the Constitution.

Directions of Reform :

The need and importance of attempts at uniformity in sales tax policies has been pointed out above. The steps in respect of which such uniformity is desirable and the steps to achieve the same may now be indicated. Firstly, the basis of tax should be uniform. From all considerations, it would appear that single-point basis is the most suitable form of sales tax that can be adopted by the States.

Comparison of the effects of the two main systems of levy :

There are two main systems of sales tax, *viz.*, the single-point and the multi-point. The multi-point basis of sales tax is an inequitable form of taxation and its cumulative incidence on trade and industry is very heavy. Under the multi-point system of sales tax, the tax is levied at each and every stage through which the commodity changes hands. This, therefore, adds to the cost of the supplies of raw materials, components and other articles required for manufacturing and processing purposes, thus raising the cost of production of the finished article. In the result, multi-point system of sales tax weakens the competitive capacity of the finished products of one State as against the products of the other State where the single-point system is in vogue. Under the single-point system, tax is generally levied and collected at the retail stage, *i.e.*, when the goods are sold either to unregistered dealers or to the consumers directly, the earlier sales, *i.e.*, sales between one registered dealer and another registered dealer being free of sales tax. Sales of goods by registered dealers to the manufacturers and processors would, therefore, naturally be exempt from the sales tax levy. The manufacturers and processors who are registered under the Act are, therefore, in a position to make their purchases of raw materials and other goods required for their manufacturing and processing activities without any sales tax. As regards the manufacturers who are not registered under the Act by virtue of their turnover being less than that laid down for the purpose of tax liability and registration, sales by registered dealers to such manufacturers will attract the tax, the transaction being one between a registered dealer and another unregistered dealer. Sales of the finished products by such unregistered manufacturers will, however, not attract the sales tax as the Sales Tax Act does not bring within its purview unregistered dealers. On the whole the manufacturing cost of the various products does not, therefore, rise directly on account of the sales tax under the single-point system. From the point of view of manufacturing costs, therefore, the single-point system is decidedly preferable to the multi-point basis.

Disparity in incidence of tax under the two systems :

The incidence of sales tax on various articles under the single-point system is the same, whereas it varies under the multi-point system, according to the nature of the article. On an average, an article is supposed to change hands three or four times. There are, however, certain articles which change hands even a larger number of times. Such articles will, therefore, bear larger tax burden under the multi-point system.

Effect on Organisational arrangements of Trade :

The multi-point system disturbs the organisational arrangements connected with the handling of trade. Goods pass through various traditional channels or agencies handling trade in successive stages, such as the manufacturer, the importer, wholesaler, semi-wholesaler, sometimes an agent, the retailer and the shop-keeper or the vendor. In the anxiety to reduce the price-spurt consequent on the frequency of changes through the above traditional channels, there is a tendency for reduction in the number of stages which inevitably leads to the displacement of trade channels. This was one of the main reasons for the strong opposition of the commercial community of this State to the introduction of the multi-point system of sales tax in the State by the Government of Bombay last year. The apprehensions entertained by the mercantile community on this score seem to have been borne out by

facts. There are complaints from various sections about the tendency on the part of the manufacturers or the importers to eliminate the traditional intermediary channels and reach the consumer directly, in order to avoid the incidence of sales tax that would be required to be paid if the goods were allowed to pass through the traditional channels.

Effect on Exports :

Under the single-point system, just as there is an automatic exemption of goods and materials required by manufacturers in their manufacturing and processing activities, there is a similar automatic exemption under that system for goods purchased for the purpose of exports outside the State limits. No such automatic exemption, however, obtains under the multi-point system. On the contrary, it being the principle of multi-point sales tax that tax would be attracted at each stage in the series of transactions, the cost of the articles which are bought for the purpose of exports outside the State limits goes on increasing with every addition in the number of links. In the context of the export drive which our country has launched with a view to retaining the markets which have been captured during some time past and to capture new export markets if possible, it is very essential to see that the competitive capacity of our export products is not affected adversely in any way. Further, it is a patent fact that there has been recently a shift in the world markets and these markets have now changed from sellers' to buyers' markets with the result that our export products have to meet with increasing consumer's resistance in the foreign markets. It is, therefore, of the utmost importance that the tax burden on our exports is kept at the minimum level possible. From this point of view also, it would appear that multi-point sales tax is not a desirable form of sales tax.

Effect on Trade :

It has been pointed out above already that multi-point sales tax leads to the elimination of the intermediary traders. The manufacturers and the processors as also the consumers, instead of making their purchases from the dealers within the State try to procure their requirements of supplies and other goods directly from other States where single-point sales tax is in existence, with a view to avoid the consequence of tax that would be payable if the goods are purchased from the internal sources. This inevitably leads to the diversion of the trade from the dealers in the State where the multi-point system exists to the dealers in other States.

Concealment of tax liability under the multi-point system :

Under the single-point system, the buyer or the consumer knows the exact extent of the tax burden. Under the multi-point system, he would have no direct and exact knowledge of the incidence, as he has no method of checking up the previous tax borne by the article purchased by him. He might feel that the price quoted to him minus the tax is the price of the goods and on that account might feel that the price charged to him is unduly high.

Administration and enforcement of the Act :

Under the single-point system of sales tax, manufacturers and wholesalers who generally carry on transactions only with registered dealers have not pay any sales tax, sales between one registered dealer and another registered dealer being tax-free. Secondly, although such manufacturers and dealers are required to be registered under the Act by virtue of their turnover being above the limit prescribed for the purpose of registration, they can get a general exemption from the requirement of having to make returns of their turnover. The manufacturers and dealers are, therefore, spared a great deal of formalities to be observed under the sales tax law. Under the multi-point system of sales tax, however, sales tax being charged on every stage of transaction, even manufacturers and wholesale dealers having transactions with registered dealers only have also to pay sales tax and they have to observe all the formalities in connection with the payment of tax and the filing of periodical returns. The work of the Sales Tax Department also is greatly minimised under the single-point tax, owing to the fact that the number of assesseees under the single-point system is smaller than under the multi-point system. The multi-point system, therefore, would require a larger number of staff than under the single-point, thereby increasing the administrative expenditure.

From the above discussion about the merits and drawbacks of the two systems of sales tax, viz., the single-point and the multi-point sales tax, it will be seen that the former is preferable to the latter in many respects. It would, therefore, be appropriate to suggest that all the States should levy and recover sales tax on the basis of single-point levy.

Secondly, there should be, at least, some uniformity in regard to the rates levied in the various States. As

has been already pointed out above, the varying rates result in unequal distribution of the burden of sales tax on the trade and commerce of the various parts of the country and leads to diversion of trade and industry from areas which have higher tax burden to the areas with less burden. In order to obviate this tendency, it will be necessary to see that the disparities in the rates of taxation are not wide. It will be reasonable to suggest that one way of reducing the tax burden on the industry and bringing about uniformity in regard to rates will be to place a ceiling on the maximum rates that can be levied by the States.

Thirdly, there should be a uniform list of articles to be exempted from the sales tax levy. As has been pointed out above, The Essential Goods (Declaration & Regulation of Tax on the Sale and Purchase) Act passed by the Union Government under the provisions of Article 286(3) of the Constitution permits the continuance of the levy of sales tax on the 'essential goods' by the States which were having such levies prior to the commencement and enforcement of the Act. This provision is acting as a serious handicap in the way of attainment of uniformity in regard to an important aspect of sales tax and it is imperative to take early measures to modify the provisions of the Act, so as to preclude all States from levying sales tax on goods which are declared as 'essential' and enumerated in the Schedule appended to the Act. The Essential Goods Act only lays down certain articles which are essential for the life of the community. There are also other articles which require to be exempted from the levy of sales tax on other considerations. The main industrial raw materials, for instance, like iron, steel, cotton, cement, coal, oilseeds and oils, etc., should be included in the Schedule of exemptions. The exemption of such main industrial raw materials is most essential from the point of view of minimising the tax burden on the industries and enabling them to reduce the cost of production of the finished articles. Another principle that should be borne in mind in regard to the drawing up of the Schedule of exemptions is that all such goods as are subject to other taxes should be free from the levy of the tax by the States. Articles like tobacco, matches, vanaspati products, etc., which are subject to the central excise duty should be outside the purview of the sales tax levied by the States, since the imposition of the sales tax on these articles would mean subjecting these articles to double taxation and result in increased burden on the consumer.

Fourthly, no sales tax should be imposed by any State on goods going outside the State limits, both to the destinations in the Indian Union and to the overseas destinations. The sales tax legislations of all the States, therefore, should contain a provision laying down that sales tax should not be levied on any goods going outside the State limits. The provision should be clearly worded and there should be no scope for doubt about its implications. Further, it is necessary to point out that goods going outside the country should not bear tax at any point, as otherwise, the competitive capacity of our exports is weakened *vis-à-vis* similar products coming from other sources in the foreign markets. The provisions of the Constitution in question which, as already stated, have led to a great deal of confusion and difficulties of a practical nature should be suitably amended at an early date. The problem created by the interpretation by the Supreme Court of the provisions of the Article in relation to inter-State transactions particularly requires to be solved as expeditiously as possible, as in the wake of that judgment, various State Governments have issued notices on outside dealers asking them to produce account books before their Sales Tax Authorities and to pay sales tax on the goods supplied by them to the parties in their own States, and this is causing serious inconvenience and hardship to the dealers.

Finally, it is necessary to emphasize the need for making the Sales Tax Law very simple so as to make it easily intelligible to all those who are affected by it. As the obligations in respect of sales tax have to be discharged by a large number of merchants and traders who normally do not have elaborate organisational facilities, it is necessary to stress the importance of making the tax structure and the formalities prescribed thereunder so as not to cause difficulties of a practical nature in its actual implementation. The sales tax legislations of some of the States are of a very complicated nature. The present Bombay Sales Tax Act, for instance, and the formalities prescribed thereunder have been found to be irksome in actual working and the dealers are not in a position to find their exact liability with ease under the provisions of the Act. The scheme and structure of sales tax embodied in the Bill recently introduced by the Government of Bombay in the State Legislature and referred to the Select Committee is still more complicated than the scheme and structure contained in the present Act. The Bill envisages as many as six levies such as Sales Tax, General Sales Tax, Purchase Tax, Outside Goods Purchase Tax, Special Goods Sales Tax and Special Goods Purchase Tax. The Bill, broadly speaking, seeks

mainly to provide for the imposition of sales tax at two points. The provisions prescribed for the purpose of ensuring the two-point levy are further of an intricate nature and will create hardships and difficulties in actual working. The point that must be noted, in this connection, is that as Sales Tax Law is of a general application and brings within its purview a large number of smaller dealers who do not have the organisational set-up to understand their exact obligation and liability under the law, it should be as simple as possible. The levies prescribed under the law should be very few and the procedure and formalities laid down in connection with the assessment and payment of the tax should also be simple so as not to cause any undue inconvenience and hardship to the dealers who are affected thereby.

With these general observations, we would proceed to answer the questions in the Questionnaire bearing upon sales tax.

Question 125.—*Under the Constitution, the only sales or purchases which can be taxed are sales or purchases of goods. Do you consider that the sales tax should be extended to—*

- (i) services, so that the tax may be leviable on (a) charges for services proper (e.g., bills from a goldsmith or a printer), (b) charges for both services and goods where the two cannot be readily separated (e.g., hotel bills) and (c) charges for certain types of goods, into the price of which service enters as a substantial element (e.g., paintings or photographs); and
- (ii) transactions of sale or purchase in stock exchanges and futures markets? If so, please deal with the administrative and other issues which may arise in the implementation of your suggestions.

We favour the continuance of the present position under which sales or purchase tax could be levied only on transactions involving transfer of goods as such. It is not desirable to extend the same to the services. The income from services wherever they are of a taxable character or quantum bears taxes in the shape of income-tax. Rendering services of the kind under reference, even where the services are compensated by payment, cannot be construed as in the nature of transactions involving transfer of goods. We are also not in favour of levying sales tax in respect of transactions involving sale or purchase in stock exchanges and other forward markets. Transactions in such markets, over and above the taxes borne directly or indirectly, are subject to levy of stamp duty, the incidence of which has shown progressive increases in recent years. No additional impost in the shape of sales tax on such transactions would be justified.

Question 127.—*As regards sales tax generally and, in particular, the sales tax on goods leviable by the States, it is sometimes argued that—since all goods sold in a State must fall within one of three categories, viz., (a) manufactured or produced within the State, (b) transported into the State from elsewhere in the country, and (c) imported into the State from abroad—an extension or increase of excise would serve just as well as sales tax for category (a), of octroi or terminal tax for category (b), and of customs for category (c). Do you agree with this view which implies that the sales tax has no specific function to perform in the country's system of taxation? If not, what in your opinion, from the point of view of correlated tax-structure, is the legitimate place and scope of the sales tax as distinguished from that of excise, octroi and customs?*

The sales tax is essentially a tax on consumption and it is a levy which normally can be passed on to the consumer, who is expected to bear the incidence of the same. If the tax burden consequent upon such a levy is to continue as a normal feature of our tax structure, we would prefer that the same should be continued in its present form as sales tax as a separate levy instead of any proposal to aggregate it by an extension or increase of levy such as excise, octroi or customs.

Question 128.—*(a) Sales tax is almost invariably levied by the State Governments in terms of the turnover of the dealer over a given period. Since a sales tax leviable on the individual transaction necessitates fairly elaborate accounts, cash memos, etc., which only a small proportion of dealers is equipped to maintain, do you agree with the view that, in Indian conditions, the bulk of the sales tax is likely, for a long time to come, to continue to be leviable on aggregate turnover as distinguished from the individual sale-price?*

If liability to sales tax is to be determined by the extent of the aggregate turnover of an individual dealer without going into the details of the transactions which have resulted in the turnover, provided the rate of tax is kept very low and not subjected to variations from

practical considerations same would appear to be very advantageous. But at the same time, we cannot be certain that such an arrangement would eliminate the requirement in regard to preservation of accounts, cash memos, etc., for the obvious reason that the turnover figures will have to be established before the assessing authorities and in the process of verification, the authorities would require production of such evidences as would establish the correctness of the turnover figures estimated or given by the assessee.

Question 128.—*(b) In most States there are separate laws governing sales tax on petrol. To what articles, if any, do you consider it desirable and feasible to extend the particular system adopted in respect of petrol?*

We are not in favour of petrol being treated separately under a distinct law. We have suggested elsewhere that the State tax on petrol should be merged with the fuel tax levied by the Centre and a part of the proceeds from the composite levy should be distributed to the States on the basis of a formula linked to consumption of petrol in each individual State.

Question 129.—*(1) In regard to a system of levy based on turnover, is the choice broadly limited to the alternatives hereinafter mentioned or is there any other system you would advocate? Under the system you recommend would sales tax continue to be roughly as significant a source of State revenue as at present? The alternatives referred to above are:*

- (i) a relatively low rate of levy at each of almost all points of sale; few dealers excluded and few goods exempted (multi-point);
- (ii) a relatively high rate of levy at only one point, viz., the point at which a registered dealer sells either to a consumer or to an unregistered dealer; exemption from tax of sales by one registered dealer to another registered dealer; exclusion from compulsory registration of a dealer below a certain limit of turnover; a large number of exempted goods (single-point);
- (iii) Various combinations of the above.

We have dealt with the issues covered by the question in detail in our preliminary observations. We would only supplement the same by giving our categorical view that so long as sales tax as an item of major taxation is continued it should be on the basis of single-point levy. We are also opposed to any proposal involving a combination of more than one basis of levy.

While on this, we would also urge for the consideration of the Commission the desirability of substituting a system of purchase tax in place of the present sales tax. Purchase tax also ensures tax being levied only at one point, viz., at the last point where the goods pass on to the consumer. Such a proposal should be examined only if all the States are in favour of introducing the same basis in their respective tax systems, eliminating altogether the sales tax. One great advantage would be that the system of purchase tax would eliminate the elaborate requirements in regard to maintenance and preservation of accounts in the form in which they are required to be maintained at present. In many of the advanced countries of the world, particularly in the West, generally purchase tax is in vogue, there being no sales tax as such.

Question 129.—*(2) Which of the above alternatives would you advocate? Please state your reasons in some detail, comparing merits and demerits from the point of view of (a) the consumer, (b) the dealer, (c) industry, trade, etc., generally, and (d) Government. Please relate your arguments, as far as possible, to lessons which may be drawn from the actual working of Sales Tax Acts in different States.*

(3) In particular:

- (i) As regards (a) above, do you think that the sales tax, or any particular form of it, leads to a greater burden being placed on the consumer than is accounted for by the proceeds which accrue to the Exchequer?
- (ii) as regards (b) above, have you any suggestions to make regarding the simplification of forms, accounts, etc., and of the procedure generally in order to make the administration of the tax less burdensome to the dealer? Further, having regard to the cost of maintenance of the machinery for compliance, would you suggest an alternative form of taxation so far as small dealers are concerned?
- (iii) as regards (c) above, has the imposition of the sales tax led to any noticeable change in the organisation of the trade in the country, especially in regard to the size of the business

unit, location of head-offices, number of intermediaries, variety of the goods dealt with, etc.?

- (iv) as regards (d) above, please examine the financial and administrative aspects, including the scope for evasion presented by the particular system and the difficulty or otherwise of counteracting it.

The issues covered by this part of the question have been dealt with in detail in our general observations. Our supplementary suggestions are that as the sales tax law generally affects a large number of small businessmen, who have not the necessary organisational set-up to understand the intricate provisions and requirements under the law and to discharge the obligations in the direction of maintaining elaborate accounts, which necessitate guidance by experts, it is very essential that the structure of the law and the detailed provisions thereunder should be made very simple and easily understandable. The administrative formalities should also be considerably minimised. In the case of dealers whose turnover generally does not exceed Rs. one lakh, the production of their normal account books to support their turnover figure should be deemed sufficient. Elaborate forms and return should be avoided in the case of such small dealers. Again, the assessments should be completed almost immediately. The present practice of merchants being required to maintain and preserve records for periods stretching over two and three years is found to be very onerous. Some of the consequences resulting from the levy of sales tax in the State has been discussed in our preliminary remarks. The displacement of the normal trade channels and diversion of trade from the traditional centres are major consequences noticeable. We would earnestly urge that whatever recommendations are made in regard to the structure and scheme of levy of sales tax, the Commission would lay due emphasis on—

- (i) the need for uniformity both in regard to the basis and in regard to the other essential details connected with the structure,
- (ii) the importance of the scheme being simple and easily understandable by the ordinary trader, who is affected by it in a day-to-day manner,
- (iii) the levy being such as would be easy in the process of collection,
- (iv) the importance of seeing that the incidence of the tax is not strikingly noticeable, and
- (v) that the tax is at the stage of the ultimate consumer, for sales tax is essentially on consumption.

The arrangements and the basis of the levy should not be such in any area as to result in the diversion of traditional trade from that area to another.

Question 130.—In relation to the particular system you advocate :

- (i) should there be special rates of levy, higher than the ordinary rate, for certain articles? If so, for which types of articles?

Broadly speaking, we are not in favour of a system under which there would be graded or differential rates for different groups of articles. Except in regard to articles which require to be completely exempted from the levy by reason of their essential character, the basis and rate of levy should be uniform. If for meeting the budgetary exigencies of a particular State it is found necessary to levy the tax at a higher rate on certain articles, then the list of articles subjected to the special levy should be confined to items which are really of a luxury nature. At present in Bombay, in terms of the new Bill, the special levy is to be inflicted on as many as 54 items, some of them of a day-to-day essential character, such as aerated water, sweetmeats, bicycles, stainless steel domestic utensils, fountain-pens, etc. The Central Government have declared that certain articles should be considered as essential and free from liability to sales tax. In the same manner, if tax at a higher rate is deemed inevitable on certain items, the list of articles subjected to such a higher levy should be standardised by the Central Government and the same list should apply uniformly to all the States. Otherwise, the present practice of the higher rate of special tax leading to artificial arrangements for diversion of trade, e.g., the Bombay user buying his motor car from upcountry dealer will continue.

Question 130.—(ii) Should there be special rates of levy lower than the ordinary rate, for certain articles? If so, for which types of articles?

Normally we are not in favour of more than one rate of levy, provided the general rate is reasonable; but if the general rate is kept comparatively higher, then relief by way of reduced rate should be given in respect of items in common use entering into the daily budget of the poorer sections of society. It is not difficult to frame a list of such items meriting special treatment, once the policy underlying the same is agreed to.

Question 130.—(iii) Which articles, if any, should be exempted altogether and why? Please elaborate the principles, which, in your opinion, should underlie exemptions.

The list of articles to be exempted should be uniform for all the States. First and foremost, goods declared as essential under the central legislation should, as a matter of course, be exempted without the present position of prior levies continuing. The main and basic raw materials used by industries should, as a matter of course, get exemption. There is also strong support for the point of view that articles which are subject to special levy by other taxation enactments, such as excise, special cess, etc., should be free from the levy of sales tax.

Question 131.—In regard to system, rates, exemptions, etc., what degree of uniformity between the different States do you consider desirable and feasible? Would you bring it about—

- (i) by formal or informal convention;
- (ii) by central legislation promoted at the instance of two or more States;
- (iii) by constitutional amendment, so as to include certain basic matters connected with the sales tax in the Concurrent List?
- (iv) by constitutional amendment so as to include the item of sales tax, as a whole, in the Union List? In the last-mentioned case, how would you apportion the proceeds? Would this alternative be a practicable proposition from the point of view of the finances of the States?

We have already dealt with this issue in great detail in our preliminary observations. Uniformity is essential and should be achieved, whatever the methods adopted. In the light of the experience of the working of the sales tax in the different States and the attitude of insularity shown by some of the State Authorities, there is considerable force in the point of view that sales tax should, by a constitutional amendment, be made a subject under the direct control of the Union Government. It is not difficult to evolve a formula governing distribution. As in the case of the divisible pool of the Income-tax, the division could be on a pre-determined basis and as sales tax is a tax on consumption, it could be very readily suggested and agreed that the division should be linked to consumption. But from practical considerations, it is perhaps difficult to expect the State Governments to agree to surrender their right in respect of sales tax or agree even voluntarily to transfer the same from the State List to the Union List. In the event of such transfer not being considered feasible, the other alternative should be for certain essential matters like the basis of levy and collection, the items to be exempted and sales tax on inter-State trade and commerce to be brought under central jurisdiction. Failing agreement on efforts in the above direction, at all events, by informal measures, the Central Government should take the initiative in creating conditions favourable for the acceptance of an informal convention, under which on the above basic and general aspects, uniformity would be secured.

Question 132.—To what extent has any desirable uniformity been achieved in regard to exemptions (in favour of "goods essential for the life of the community") under Clause (3) of Article 286 of the Constitution? What principles would you advocate for deciding the exemptions to be made under this provision of the Constitution? Do you consider that the scope of the provision contained in Clause (3) of Article 286 should be extended also to "essential articles" which had been subject to sales tax before the relevant central enactment came into force?

Unfortunately, the spirit underlying the provision in Article 286(3) regarding exemption of goods "essential for the life of the community" has not been properly observed in certain States by reason of the existence of a prior levy or some of the items declared as "essential" by the central legislation. We have already commented on this aspect in greater detail earlier. Essential articles which had been subject to sales tax before the coming into force of the central enactment should also get the benefit of the exemption.

Question 133.—(a) As regards "sales outside the State", "inter-State commerce", etc., please discuss the adequacy or otherwise of the relevant provisions of Article 286 and suggest remedies for any defects which, in your opinion, have been revealed in the actual working of these provisions.

We are of the considered opinion that no sales tax should be imposed by any State on goods going outside the State limit, both to destinations within the country and overseas. The immunity from liability should extend to all stages of transaction which ultimately result in the goods going outside the State limits. Illustrating the point, if, as a result of the organisational arrangements connected with any trade in a particular State,

in the process of export outside the State, such goods change hands more than once, successive stages of the transaction should all be free from liability, so long as the goods ultimately leave the limits of the State concerned.

Another point which we would like to emphasize is that dealers resident in a State should not be brought within the jurisdiction of Sales Tax Authorities in another State on the ground that the destination State would be the State competent to levy sales tax. The Supreme Court Judgment in that regard has led to difficulties of a practical character. A dealer in Bombay, for instance, having transactions with constituents spread over the different States, is expected to conform to the requirements of the State laws of all such State Governments, get himself registered under their respective laws and subject his accounts to be inspected by the authorities of the respective States. The confusion resulting from such a position can be easily imagined. There should be some territorial limitation to the application of the sales tax legislation and the legislation of a particular State should not apply to a dealer in another State unless the dealer in question is himself trading directly or through agents in the State concerned.

Question 133.—(b) Please discuss in this connection the desirability and feasibility of the suggestion that purchases only (and not sales) should be taxed, so that the tax jurisdiction of each State might be confined to parties residing within the State. Alternatively, do you consider that purchases should be taxed in certain cases and sales in certain others; if so, how and on what considerations would you define the two categories? In either case, please describe your scheme in some detail and explain the advantages which you claim for it.

We have already earlier suggested the desirability of purchase tax being introduced in place of the present scheme of taxation on sales. Such a change is being suggested only if all the States agree to the substitution. We are also not in favour of a combination, under which both purchase tax and sales tax would be enforced. By far the most important advantage under a scheme of purchase tax is that it would eliminate the complications that have been noticed in relation to inter-State trade, as the tax liability would be at the stage of purchase. It would incidentally also reduce administrative and procedural formalities under the sales tax scheme. Public reaction to these formalities has been quite unfavourable.

Question 134.—Do you think that lack of uniformity between the States as regards the rates of sales tax and the methods of applying it (single or multiple point) has the effect of raising barriers in inter-State commerce or of inducing uneconomic diversions of trade? If so, what measures would you suggest to rectify the position?

The defects and drawbacks resulting from the lack of uniformity between the sales tax structures in different States have been discussed at length in our preliminary observations. The absence of uniformity has been one of the main contributing factors for artificial arrangements resulting in diversion of trade from traditional centres and channels. The remedial measures are obvious. The system of taxation should be uniform, the rate structure should be uniform and the list of exemptions should also be uniform.

STATE EXCISES

Question 135.—(a) In regard to State excise duties and the revenue therefrom, have you any comments or suggestions to make—

(i) on features of importance connected with the system of levy of these duties in different States

or

(ii) on policies involving various degrees of relinquishment in certain States of the revenue from these duties?

Should there, in this context, be uniformity between different States? If so, in what particulars and to what extent?

So far as the State of Bombay is concerned, the revenue from excise has gone down substantially. In the peak year 1946-47, the revenue from this source of taxation was Rs. 9.74 crores. A decline, year by year, is strikingly noticeable. In 1947-48, it went down to Rs. 8.54 crores, in 1948-49 to Rs. 6.17 crores, in 1949-50 to 4.09 crores, in 1950-51 to Rs. 1.07 crores, in 1951-52 to Rs. 0.92 crores, in 1952-53 to Rs. 0.97 crores and in 1953-54 to Rs. 1.12 crores. The largest contributing factor for this set-back is the impact of the prohibition policy. The State of Bombay and certain other States have given top priority to the enforcement of prohibition. We are aware that in terms of our Constitution, State Governments are expected to endeavour to bring about prohibition of the consumption of intoxicating drinks. We also acknowledge the desirability of this

reform on social grounds. At the same time, in the light of the overall picture of public finances of the States, we feel that the time, pace and stages of the enforcement of prohibition should not be in such a manner as to cause serious disequilibrium in the budgetary position of the States. Economic considerations indicate the desirability of introducing an element of graduality in the present programme of enforcement of prohibition in the different States. There is also support for the point of view that the pace and stages of enforcement should be linked to the programme of all-India application. The larger objective underlying this reform will, perhaps, not be realised if certain parts of the country alone are either completely or in selected regions made free from the habit, without any progress having been made or any proposal for such progress being considered in other States in the country itself.

Question 135.—(b) Is there proper co-ordination between the levy of central excise on medicinal and toilet preparations containing alcohol, etc., and of State excise on alcoholic liquors? If not, what steps would you suggest to ensure adequate co-ordination?

Considerable difficulties are experienced as a result of lack of co-ordination in the levy of excise as between the Centre and the States on the one hand and as between the different States on the other. The difficulties in that sphere were the subject-matter of expert scrutiny and a Committee appointed by the Government of India had gone into the question of the rates of duty on spirituous medicinal preparations. Apart from the rate and the level of the duty, the difference in the pace of acceleration of prohibition policy in the different States has led to difference in arrangements for use of alcohol in medicinal and toilet preparations and conditions accompanying their use, handling and movement. This is a sphere in which co-ordinated action is necessary and the Central Government may be desired to initiate efforts which would result in the rates of duty and the conditions governing use of alcohol in medicinal and toilet preparations being made uniform.

GENERAL

Question 136.—Do you think there is a case for vesting in the administration the power to alter, by executive order, the rates of import duties, export duties and excise duties? If so, please indicate in what circumstances and within what limits such power should be exercised.

Normally, it would be undesirable to vest in the executive powers for varying rates of import, export and excise duties. These rates should preferably continue to be fixed by statute and any change in the same should only be on the basis of parliamentary sanction. The introduction of export duties at substantial rates during the period of war in our scheme of commodity taxation, however, necessitates some arrangement for flexibility to meet exigencies resulting from market changes in other countries. In the case of export duties, particularly where the duty acts as a disincentive for exports or is found to be coming in the way of increased exports, the executive authority should be in a position to bring about adjustments by immediate reductions wherever necessary. In the case of import duties, however, the executive should not have power to vary duties, which are of a protective character. Executive decisions involving variations in rates of duty should be placed for parliamentary approval at the earliest opportunity. In the case of excise duties, we do not envisage the necessity for provision empowering the executive to vary the same from time to time.

Question 137.—Do you visualise any scope for extension of the field of commodity taxation as a result of the implementation of the Five-Year Plan?

As a result of the Five-Year Plan, the commodities liable to taxation will increase in supply and the turnover of such commodities would also automatically increase. Their exports would result in larger yield of aggregate revenue from export duty. Apart from the augmentation of the overall revenue position, consequent upon increased supply and increased turnover, in the spheres of import duty and excise also, larger import activities necessitated by the development programme of the country would bring in larger revenue in the shape of customs duty; the feasibility of levy of excise duty at very low rates on some new articles may be examined. Increased production would yield increased excise revenue. Beyond, therefore, the additional revenue resulting from expansion of activity, we do not consider that there would be additional scope for extension of commodity taxation by new or increased levies.

Question 138.—What "luxury" articles, if any, would you suggest on which commodity taxes in any of the various forms might be levied at specially high rates?

The term 'luxury articles' is relative. What may be considered as luxury in certain circumstances would be essential, even normally, for certain requirements

We are, therefore, not in favour of introducing an element of higher rate based on such classification of commodities as luxury or essential. It must not be overlooked that the levy of tax at almost prohibitive

rates on items of luxury would result in a regressive effect on the use or consumption of such items and the higher incidence defeating the object in view, *viz.*, increased revenue.

PART IV.—AGRICULTURAL INCOME-TAX, LAND REVENUE AND IRRIGATION RATES.

Tax on land is the recognised and traditional form of taxation since the earliest times. In fact, in the old days when the taxes on income and commodities levied at present were not at all thought of, taxes on land and the Poll Tax were the only sources on which the State had to rely for its finances. Even as late as the 19th century land taxes contributed a major share of the total revenues of the countries. In recent years, however, with the introduction of taxes on personal incomes and commodities, land taxes hold a less important position and they contribute a small proportion of the total revenues of the countries. The following table indicates the extent of the decreasing importance of land revenue in the finances of India:—

Percentage of land revenue to the total revenue of India

Year	Percentage	Year	Percentage
1881	53.75	1924	20.75
1894	46.77	1939	15.50
1904	42.76	1949	4.05
1914	35.42	1950	4.36

Thus, while almost all other taxes have increased in recent years, land revenue which used to be the mainstay of Government, 50 years ago, contributing over 50 per cent. of the total revenue of whole of India, has in 1949-50 contributed less than 10 per cent. of the State revenue and 5 per cent. of the total revenue of India.

Tax on land at present comprises land revenue, tax on agricultural incomes and irrigation rates. While land revenue is the common and the prevalent method of levying taxes on land, agricultural income-tax is levied in the States of U.P., Bihar, West Bengal, Assam, Orissa and Travancore-Cochin. The rates of agricultural income-tax vary from State to State. The maximum rate at which the tax is levied is 4 annas in the first four States but 3 annas only in Orissa. In addition to the usual tax, a super-tax at the maximum rate of 5 annas 3 pies on incomes exceeding Rs. 25,000 per year is levied in U.P. The exemption limit is Rs. 3,000 in West Bengal, Assam & U.P., Rs. 3,500 in Bihar and Rs. 5,000 in Orissa. The whole of the agricultural income of companies is taxed at the maximum rate of 4 annas in the rupee in West Bengal and U.P. The Government of U.P. also levies a super-tax at the rate of 1 anna on the agricultural income of companies. In Bihar and Orissa, the companies are taxed on slab system on the same basis as individuals. In Assam, the agricultural income of companies has two slabs only, *viz.*, income below Rs. 10,000 is taxed at 2 annas and 6 pies in the rupee and income above 10,000 rupees at a rate of 4 annas.

The contribution of irrigation rates is insignificant at present, but with the completion of the various irrigation projects, this source of revenue offers a good scope for increased income for supplementing the general revenues of the States.

Taxes on land do not affect the commercial community directly. In the wider sphere of public finance, however, all taxes are interrelated and, therefore, to the extent that agricultural taxes affect the general revenues of the country, they have an indirect bearing on the commercial community. Thus, changes in the agricultural taxes do affect the general revenues of the country and its impact is bound to have repercussions on the taxation structure as a whole. This, in turn, would necessitate the changes in taxes on incomes and commodities with which the business and industrial community is directly concerned. Without going into the matter of relative details, therefore, we would like to confine here to certain aspects concerning overall policy of agricultural taxation.

As stated earlier, land revenue which is a common form of taxation on land, has lost its significance as a source of contributions to the State Exchequer. For a number of years, the revenue from this source has remained more or less static. Other taxes like income-tax, sales tax, customs duties, etc., have been increasingly resorted to whenever the Government is confronted with financial stringency. The scope for increased revenue from land requires to be scientifically investigated. Besides strengthening the finances of Government, it will also, to some extent, correct the main defect of the existing structure of taxation of our country, *viz.*, very narrow range of population made to bear a relatively heavy burden of taxation. In recommending this we are supported by no less an authority than the Planning Commission, whose observations on the point bear repetition.

"A striking feature of the present structure of taxation in India is the relatively narrow range of

population affected by it to any appreciable extent. About 28 per cent. of the total tax revenue comes from direct taxation which directly affects only about half of 1 per cent. of the working force in the country, estimated at 133 million in 1948-49. Another 17 per cent. is accounted for by import duties, a considerable part of which is derived from taxation of commodities like motor vehicles, motor spirit and oils, high quality tobacco, silk and silk manufactures, liquors and wines, etc., which effect but a relatively small section of the population. A large proportion of the excise duties on tobacco and cloth, which yield about 8 per cent. of the total tax revenue, is also probably paid by the limited number of consumers who use better varieties. Given the structure of incomes in the country, it is of course inevitable that the coverage of direct taxation should be narrow; it is also right that an element of progression should be introduced through higher taxes on commodities which, relatively to the general pattern of consumption of the community, may be regarded as luxuries. In fact, ways and means for raising the revenue from this source must be constantly explored. But if as much as one-third or more of the total tax revenue is derived from certain limited strata of society, it is implied that the burden of taxation spread over the rest of the community is correspondingly lighter and that relatively small increases in the rates of taxation on the latter will help to add significantly to total tax revenue."

Stating that it was a taxation on land which in Japan provided the initial resources required for development, the Planning Commission further observed that:

"In recent years prices have moved in favour of primary commodities and, since, in most parts of the country, land revenue has not been raised upwards, the burden of this tax has been considerably lightened. It is reflected partly in the fact that land revenue contributes at present only about 8 per cent. of the total tax revenue as compared to about 25 per cent. in 1939. The rise in agricultural prices has, however, benefited significantly only producers with sufficiently large marketable surpluses; it is also true that costs of production have gone up in many cases. The improvement in prices cannot therefore by itself be made the basis for a substantial upward revision of the tax on land. But within the context of a development programme designed as much to raise agricultural prosperity as to promote all-round economic development, a programme towards which all sections of the community have to contribute to the maximum extent possible, there is a case for moderate upward revision of land revenue. . . . Betterment levies designed to draw into the public exchequer, a proportion of the capital gains that accrue to private parties as a result of development are a recognised device for strengthening public savings."

The shift in prices, resulting in more benefits to the agricultural class than the industrial and commercial community has become more pronounced in recent months.

The case for an upward revision of land revenue is on strong ground. The Indian Taxation Enquiry Committee, as early as 1924, had pointed out that too light assessments are not in themselves very much conducive to agrarian progress. On the contrary, "the lightness itself has aggravated evils since it has had the result of converting many a land-holder who would have had to cultivate his land if the State share had been larger, with the rent-receiver living on the proceeds of another's labour".

We are, therefore, of the considered opinion that a general increase in the rates of land revenue is both justified and necessary in the context of the present search for additional sources of revenue. Again, those settlements which are already due for revision should be reassessed and increased yield from land revenue as a result of an upward revision of the assessments should be secured. It would be reasonable to provide that a part of the increased value of land as a result of the implementation of the irrigation schemes should accrue to the benefit of the State which is incurring the expenditure in financing the schemes. This could be done by the levy of betterment tax, irrigation cess or water cess. Possibilities of imposing surcharges on irrigation rates based on crop values for the purpose of financing projects of a local character may also be considered. On the question of agricultural income-tax, while in the past

informed opinion was in favour of removing the anomaly and making agricultural income subject to direct taxation, we are inclined to feel that in the context of the far-reaching reforms on land tenure now undertaken by the different State Governments resulting in the elimination of large holdings, perhaps, the question of the levy of agricultural income-tax is of less significance. In any scheme of taxation of agricultural income, the exemption limit has to be higher. The land tenure reform policy would preclude chances of indefinite continuance of large holdings and consequently large incomes from agricultural sources to individual owners will also come to be eliminated. In that view of the case, we feel that the case for levy of direct taxation on agricultural income has not the same significance and importance in the altered conditions envisaged, and we are, therefore, inclined to the view that such increased revenue required to be secured from land should be on the basis of increase in the rate of land revenue.

PART V.—FINANCES OF THE STATE OF BOMBAY.

Before dealing with the question relating to other State Taxes in Part V of the questionnaire, we would like to make some general observations on the overall

financial position of the State of Bombay so as to emphasize the aspects concerning increase of expenditure in the State, the consequent increase in the level of taxation and steps necessary to bring about an improvement in the overall financial condition of the State. For a period of 15 years beginning from 1921/22 to 1936 the Government of Bombay had a budgeted expenditure closely adjusted to a budgeted revenue, the successive years ending with either a nominal surplus or a deficit which was not of a big magnitude. From 1935/36 the finances of the State indicated signs of recovery. It was in that year that Government passed the Motor Vehicles Act, 1935, which yielded substantial additional revenue. The period immediately following saw quick changes in the taxation policy of the State. In the year 1938/39 a number of new or additional taxes were levied such as increased electricity duty, increased Court Fees, sales tax on tobacco, enhancement of tobacco licence fees and increased tax on betting. In the year 1939/40 Government decided upon the introduction of Prohibition. In order to make up the loss in revenue on this account, a number of new imposts were decided upon, the chief among them being the Urban Immovable Property Tax and Sales Tax on petrol. Then came the war years. The general financial position of the State of Bombay during war years is indicated by the following table:

General financial position of the Government of Bombay—1940/41 to 1945/46

(In lakhs of Rupees)

Year	Revenue	Expenditure charged to revenue	Nominal surplus or deficit	Net transfer to S. D. F.	Transfer to P. W. R. Fund	Transfer to D. R. & A. Fund	Actual surplus or deficit
1940—41	14,48	13,61	+ 87	84			+ 1,71
1941—42	16,86	15,26	+1,61	87			+ 2,48
1942—43	19,70	17,78	+1,91	— 16	1,40		+ 3,15
1943—44	25,20	21,50	+3,70	1,11	1,11		+ 5,92
1944—45	33,66	30,61	+3,03	1,90	4,50	2,00	+11,45
1945—46	34,96	34,12	+ 84	—1,31	5,50	2,00	+ 7,50

The period witnessed rapid increase both in revenue and expenditure. Substantial amounts were transferred to the Special Development Fund and the Post-war Reconstruction Fund and the Debts Redemption and

Avoidance Fund. During the period of the war Government accumulated a total revenue surplus of more than Rs. 32 crores. The sub-joined table indicates the position for the period thereafter:

General financial position of the Government of Bombay since the year 1946/47

(In lakhs of Rupees)

Year	Revenue	Expenditure charged to revenue	Nominal surplus or deficit	Net transfer to S. D. F.	Transfer to P. W. R. Fund	Transfer to D. R. & A. Fund	Actual surplus or deficit
1946—47	40,17	36,41	+3,76	1,55	2,30		+7,51
1947—48	43,75	41,33	+2,40	— 4	4,16		+6,52
1948—49	49,91	47,06	+2,85	— 12	1,70		+1,03
1949—50	61,53	61,52	+ 1				
1950—51	64,31	64,37	— 5				
1951—52	62,70	62,58	+ 12				
1952—53	64,34	64,34	—3,90				
1953—54	67,84	67,76	+ 8				

Since 1938/39 the total revenue has risen by Rs. 55,40 lakhs, an increase of about 450 per cent. Apart from the phenomenal rise in the size of the provincial revenue, striking changes have also taken place in the composition of the same. Thus, while land revenue and excise were the most important items of revenue in 1938/39 contributing about 29 per cent. and 23 per cent. respectively of the total revenue, in 1953/54 the Sales Tax and the State's share of taxes on income other than Corporation Tax figure prominently, contributing about 29 per cent. and 19 per cent. respectively of the total earnings of the State during the year.

In fact, Sales Tax, Urban Immovable Property Tax, Prize Competition Tax and Newspaper Advertisement Tax were not at all being levied in the year 1938/39 while these taxes have proved to be lucrative sources of revenue to the State Government in recent years. Receipts on account of the excise duty have considerably

fallen on account of the adoption of the policy of total prohibition. The extent of loss of revenue as a consequence of the policy of prohibition would be clear from the fact that while the excise duty receipts rose from Rs. 290 lakhs in 1938/39 to Rs. 974 lakhs in 1946/47 which was the peak year, they dwindled to Rs. 112 lakhs only in the year 1953/54. Apart from this loss of Rs. 862 lakhs in 1953/54 over the year 1946/47, the expenditure incurred for the enforcement of the policy added a further heavy charge on revenue of the State. To compensate this loss, therefore, the State Government was compelled to resort to the fresh taxation like Sales Tax, Urban Immovable Property Tax, Prize Competition Tax, etc., and to increase the rates of existing taxes such as Motor Vehicles Tax, Entertainment Tax, Electricity Duty, etc.

The following table gives a comparative idea of the main sources of the revenue of the State as in the year

1938/39 and in 1953/54 and the extent of the increase or the decrease, both in respect of the individual heads and in regard to the overall position :—

(In lakhs of Rupees)

Item of revenue	Total income in 1938-39	Total income in 1953-54 (Budget)	Increase	Per cent Increase (+) Decrease (—)
1. Taxes on income other than Corporation Tax	30	10,32	10,02	+3340
2. Land Revenue . .	3,55	6,67	3,12	+ 87
3. State Excise . .	2,90	1,12	—1,78	— 67
4. Stamp Duty . .	44	4,20	3,76	+ 855
5. Forests . .	41	3,21	2,80	+ 683
6. Registration . .	14	31	17	+ 121
7. Motor Vehicles Tax .	45	2,15	1,70	+378
8. Entertainment Tax .	24	2,70	2,46	+1025
9. Tobacco Duty . .	22
10. Electricity Duty . .	18	2,00	1,82	+1011
11. Urban Immovable Property Tax	..	1,51	1,51	..
12. Prize Competition Tax	..	13	13	..
13. Sugarcane Cess . .	64	42	—22	— 34
14. Newspaper Advertisement Tax
15. Sales Tax	16,00	16,00	..
Total (including other revenues)	12,44	67,84	55,40	+ 445

During the 15 years since 1938/39 land revenue is the only source which has recorded the least increase and has remained more or less static. Receipts under land revenue rose from Rs. 355 lakhs in 1938/39 to Rs. 559 lakhs in 1949/50 and to Rs. 667 lakhs in 1953/54. The rise in the year 1949/50 over the year 1938/39 was mainly accounted for by the additional receipts from the merged areas. Some of the settlements are already due for revision and a proposal for a surcharge on land revenue was actually made in the budget last year. In this context, the observation of the Planning Commission that the tax base is very narrow and requires widening for increasing the tax revenues, is particularly significant. Of the total income of Rs. 924.43 crores of the State of Bombay in the year 1950/51, Rs. 392.59 crores or 42.47 per cent, are earnings of agriculture, animal husbandry, forestry, fisheries, mining and salt. A substantial part of the expenditure under the Five-Year Plan is also proposed to be spent on development of agriculture, irrigation and power, and rural development. In assessing the result of the Plan, the Planning Commission estimates that the largest addition to national output is expected to come from the agricultural section. Land revenue, on the other hand, contributes only 10 per cent. of the total revenue of the State at present as against 29 per cent. in the year 1938/39. In view of this, there is a strong case for increase in land revenue at least, leaving alone for the time being the ultimate decision on the question of the levy by the State of Income-tax on agricultural income.

A review of the budgetary position of the State since the year 1939/40 indicates certain trends which call for an entire review of the pattern of public expenditure in the State and the tax structure which is sustaining that expenditure. In the year 1938/39 the total revenue and expenditure of the State was just over Rs. 12 crores. Both revenue and expenditure have gone up to over Rs. 67 crores in 1953/54. After a series of surplus years from 1940/41 the State Government have been confronted with the position of having to make up small deficits from the year 1949/50. As the deficit position year after year is showing a progressive worsening, the State authorities found themselves obliged to resort to the expedient of adding fresh taxes or stepping up or increasing the rates or revising the basis of existing taxes from time to time. Bombay already is the most heavily taxed State in the country. The citizens of the State cannot bear the present level of taxation indefinitely, let alone any increases thereto, which in effect, means that the State cannot sustain the present level of expen-

diture. Viewed from that standpoint, the main problem before a State like Bombay is one of efforts to restore budgetary equilibrium by concentrating on step necessary to reduce expenditure.

The expenditure of the State on development activities, including social services, has been of the highest order. While in a welfare State expenditure on development activities will have, it must be agreed, to continuously expend, there are limits to the extent to which the present generation can be expected to tighten up their belts in the interests of future prosperity. The ideas therefore, of the rate of annual expansion in such development expenditure and the extent to which such expenditure, essentially of a capital nature, should be found from the revenue resources, will have to be revised and adjusted to the actual realities of the financial situation confronting the State. It is, therefore, desirable to emphasize the need for greater degree of graduality in the pace and programme of implementation of the steps designed to achieve the objective of welfare State. Further, the practice of charging expenditure of capital nature to revenue account is highly objectionable in principle as well as on practical grounds. In the year 1951/52 the Government of Bombay charged to revenue account an expenditure of Rs. 105 lakhs on major irrigation schemes, and in 1952/53 charged Rs. 100 lakhs, which was an expenditure of capital nature, to revenue account.

Economy in the administrative expenditure is another way of strengthening the financial position of the State. While readily agreeing that Government had actually carried out, from time to time, measures designed to curtail avoidable expenditure, it cannot be denied that administrative expenditure forms a substantial part of the total expenditure of the State.

We have entered into a detailed discussion of the budgetary position of the State of Bombay with a view to emphasize the importance of a detailed examination of the question as to whether the present level of annual expenditure in the State of Bombay can be sustained without harmful and permanent effects on the economy of the State and the people, and if the expenditure in its present magnitude is essential and unavoidable, to what extent the same could be met by alternatives to increased taxation, viz., by steps such as introducing a greater degree of graduality in the pace of developmental programme, and by retrenchment in civil expenditure to the extent that such retrenchment is feasible particularly in the spheres of fresh or additional activities undertaken by the State during the period of the emergency.

OTHER TAXES (CENTRAL & STATE)

Stamp Duties and Court Fees :

Question 162.—Under the Constitution—

- (1) the Union is empowered to fix the rates of stamp duties in respect of bills of exchange, cheques, promissory notes, bills of lading, letters of credit, policies of insurance, transfer of shares, debentures, proxies and receipts, and
- (2) the States are empowered to fix the rates of all other stamp duties.

As regards both (1) and (2), have you any suggestions to make for the levy of a stamp duty where it is not already levied, or for an increase or decrease of the present rates where a stamp duty already exists? Please give reasons for your suggestions. Are there any general principles which you would propose for adoption in regard to the fixation of rates of stamp duties?

As regards (2), since the rates vary from State to State, what degree of uniformity do you consider desirable and feasible, and how do you propose to achieve it?

If possible, please estimate the net effect of your proposals on the revenues of States.

The constitutional position governing the right to the levy of Stamp Duty is leading to anomalous results. In terms of entry 91 in List I, viz., Union List, in Schedule VII of the Constitution Act, the rates of Stamp Duty in respect of bills of exchange, cheques, promissory notes, bills of lading, letters of credit, policies of insurance, transfer of shares, debentures, proxies and receipts will be regulated by Central legislation, whereas rates of duty in respect of documents other than those enumerated above will be regulated by State legislations. Thus, while in the case of the former list of documents, the legislating authority being common, uniformity in the rates of duty all over the country is ensured, in the case of the latter widely varying rates are in force.

The basic rates of Stamp Duty were first prescribed by the Indian Stamp Act. After the year 1921, in respect of the items which came within the State jurisdiction, there have been a series of State (Provincial) Acts designed to increase the rates of duty for the instruments within the State sphere. The enhanced duty varies from State to State, and instruments executed and stamped in one State, when received in another State where the stamp duty is higher, is

required to be charged with the excess. This is another handicap, which requires to be avoided. Uniformity in rates will remove the necessity of documents stamped in one State being required to be surcharged in terms of the stamp fee requirements in another State.

Apart from the enhanced rates of stamp duty, some of the States have also passed what are called Surcharge Acts, increasing the duties leviable under the Indian Stamp Act as amended and in force in the particular State, by way of a surcharge. In the State of Bombay, the surcharge is at the rate of 50 per cent. of the duty payable; Orissa and U. P. levy a surcharge at the rate of 25 per cent. while in Bihar the surcharge is at 37½ per cent. Thus, in effect the rates levied in the various States are much higher than the rates prescribed in the Schedule to the main Act, viz., the Indian Stamp Act. For example, on a conveyance, where the value of the consideration is Rs. 1,500, the duty payable, according to Art. 23 of the Indian Stamp Act, is only Rs. 15. But as a result of the surcharges imposed by the various States, the duties actually leviable are as follows:

Bombay City	Ra. 58	plus 50% surcharge
Ahmedabad and Poona City	43	50% "
Madras	28/8	25% "
M. P. and Bihar	30	
U. P.	28/2	25% "
W. Punjab	28/2	

It is evident from the above that the duty payable in the different States has been increased in a substantial manner, the incidence being the highest in Bombay State, viz., nearly 6 times the rate originally prescribed by the Schedule to the Stamp Act. Incidentally, it may be pointed out that, whereas the revenue from Stamp Duties, judicial and non-judicial, in the State of Bombay in the year 1939-40 was Rs. 1.38 crores, it went up to Rs. 4.18 crores in the year 1950-51.

In view of the highly varying nature of the incidence of the duty as between State and State, it is essential to secure some uniformity in the levy of Stamp Duty. The suggestion that the Centre alone should be empowered to fix the rates of Stamp Duty in respect of all kinds of documents is on strong grounds, in view of the experience of the working of the present position where under the right in certain spheres is exercised by the State authorities. It might be argued that since some of the States consider Stamp Duty as an important source of State revenue, they should have the freedom to adjust the rates to meet revenue exigencies.

We may here mention a practical difficulty experienced by the general public. It sometimes happens that the Registering authorities in a particular State refuse to allow admission of execution of a document, for example a power of attorney, drawn on a stamp paper of another State where the document is to be made use of, when presented for admission by the person residing within the jurisdiction of the former. This causes a good deal of avoidable hardship. It should be made obligatory on the Registering authorities to admit execution of documents, irrespective of the documents being drawn on stamp papers of any other State, provided that the stamp duty required to be paid on the document presented for admitting execution has been duly paid.

Question 163.—*Certain States (e.g., Bombay) levy stamp duties on transactions in forward markets. What is your view re: the complaint that these duties have tended to affect the business in these markets, particularly that of the middle-class traders? If you consider that the levy of stamp duty on transactions in these markets is a suitable and potentially important means of securing revenue, what administrative and other measures would you suggest for the efficient collection of such duties? Alternatively, in place of stamp duties, would you suggest some other form of taxation of transactions in stock exchanges and futures markets? If so, please elaborate your suggestion.*

We would like to trace the progress of the levy of Stamp Duty on forward market transactions in the State of Bombay from time to time. Before the year 1932, Stamp Duty was levied at the rate as. 2 for every Rs. 10,000 a.v. on Stock Exchange transactions. In April 1932, it was doubled by making the levy of as. 2 applicable to every Rs. 5,000 a.v. and the levy at that rate continued till March 1938. In April 1938, it was again doubled by making the levy of as. 2 applicable for every Rs. 2,500 a.v. On 1st January 1944, a surcharge of 50 per cent. was added, making the rate of as. 3 applicable for every Rs. 2,500. From 1st April 1950, the effective rate has been as. 2½ for every Rs. 2,500, and even on that basis the rate is more than four times the rate in force when the duty was first introduced. Incidentally, we would like to point out that the rates of stamp duty in the different States for purposes of stock exchange transactions vary. The Bombay rate

is the highest. This inevitably leads to a certain amount of diversion in activities from one centre to the other. In the case of Cotton transactions, stamp duty was introduced in the year 1948 at the rate of as. 6, including a surcharge of 50 per cent. per unit of 50 bales. In 1949, the stamp duty was extended to transactions in the Bullion market, and is being recovered so far as Silver is concerned at the rate of as. 3, including surcharge for every unit of 2,000 tolas, and as. 12 for every unit of 250 tolas of Gold. Government have also armed themselves with general powers to apply the stamp duty to transactions in the Commodity markets.

We had in the past drawn pointed attention of the authorities to the consequence of the levy. We had stressed that the tax would prove to be a check on the frequency of transactions. In the light of the changes that have taken place, resulting in a substantial reduction in the turnover in the forward markets, the claim of the trades, represented in the different forward markets, which have been successively pressing on the attention of Government for a review of the position as a whole, is on strong grounds. Forward markets have their own importance in the organisation of modern commerce and industry, and the high rate of stamp duty is understood to be a contributing factor for a reduction in the volume of business in the Stock Exchange.

So far as cotton is concerned, the same supply of cotton has to pass through many stages, and under the present arrangement it is subjected to duty at every stage, with the result that the cumulative effect of the levy is a substantial burden. Jobbing is an important feature in forward markets and gives a healthy tone to the transactions in the markets. The duty has proved to be a deterrent on the frequency of jobbing transactions, and as a consequence the volume of the business has been restricted to a great extent. We would also like to point out that the present position and practice of recovering the duty on both the stages, viz., the stage of purchase and the stage of sale, should be changed and the duty should be recovered only at one stage. The present practice results in one and the same transaction being taxed twice over. The duty on *badli* transactions should be only 50 per cent. of the basic rate, as *badli* transactions are in the nature of a contribution of the original one. Under the present arrangement, a *badli* transaction is charged as an ordinary purchase or sale transaction. No stamp duty should be leviable on *tara-vani* or jobber transactions. The tax should apply only to transactions between the client and the broker. *Taravani* represents quick alternative purchases and sales in order to help the smooth flow of trade from the original sellers to the ultimate purchasers. It is neither fair nor equitable to levy a tax at each such stage. The restriction in the frequency of transactions has an additional disadvantage. It throws out of work a section of the middle-class population who were normally being sustained by increased activity in the exchanges.

Question 164.—*In this country, the stamp duty is ordinarily a tax on documents which constitute evidence of legal rights. There are, however, certain taxes, such as the entertainments tax, which are sometimes collected in the form of stamps, and suggestions have been made that this system may be appropriately extended to the collection of taxes on the sale of goods or on other transactions. Do you agree with this view? If so, to what taxes would you extend the scheme?*

We do not consider the system of recovery by stamps to be a suitable method for collection of taxes on the sale of goods or other transactions. In such transactions, the liability for payment of tax arises at a prescribed point of time, quite after the transactions have taken place, as for example in the case of sales tax at the end of each quarter or at the end of a fixed period as the case may be. If payment through the medium of stamps is introduced, it would mean that the amount of tax would in effect have to be paid much in advance of the transaction, for the dealer would have to pay for, buy and keep in his possession supplies of stamps long before the transactions, for which tax payments have to be made, are effected.

Question 165.—*What are the more common methods of evasion or avoidance of payment of stamp duty? What means of prevention would you suggest?*

In the case of stamp duty attached to documents, we do not envisage the possibility or chance of any evasion, for the appropriate official authority would be checking the documents in question and impounding the same whenever any deficiency is noted. There are also provisions for penalty for under-stamped documents. The Courts also do not admit documents in evidence if they are not properly stamped. This automatically has the necessary deterrent effect. In the case of transactions in forward markets, the high rate of stamp duty is leading to certain stages of the transactions being kept on an informal basis, so as not to attract duty. The remedy there is to reduce the rates of duty and thereby discourage the practice of certain stages of the transaction being conducted on an informal basis.

In the case of adhesive stamps, the arrangement in regard to defacing of stamps should be more thorough. Carelessness in defacing stamps may lead to the same stamps being abstracted and used again.

Question 166.—*The rates of Court Fees differ from State to State. To what extent do you consider uniformity in the rates desirable and feasible?*

The rates of Court Fees differ from State to State. Different States have amended the Schedule to the Court Fees Act, and have also passed Acts imposing surcharges on Court Fees payable under the Schedule. As is the case in respect of stamp duty payable on documents, in regard to Court Fees also uniformity is desirable not only in regard to the general principles, procedure and method of realisation but also in regard to the rates at which the Fees are levied. The existence of a large difference in the rates as between the different States engenders a feeling of injustice in the person affected. Where a cause of action has accrued in more than one State, there will be a tendency to take proceedings in that State where the Court Fees are the lower. While uniformity is desirable, there may be practical difficulties in enforcing such uniformity. The scale of Court Fees may be fixed in a manner as to cover the cost of administering the law by the State concerned. Since the rate of expenses may vary from State to State, there are limitations to achieving general uniformity. The States may be required to follow the Schedule of Court Fees fixed by the Central Legislature, but they may be given power to enhance the rates or levy a surcharge within a ceiling fixed by the Central Act.

Question 167.—*Have you any suggestions to make re: the Schedules to the Indian Court Fees Act and the rates of levy thereunder?*

The Schedules to the Court Fees Act, in addition to providing for the fees payable in Courts, deal with various miscellaneous fees leviable by Revenue and other officers. While the rates of Court Fee payable in Courts should be on a uniform basis as far as possible, there is no justification for levying any Court Fee in respect of matters before Revenue and other officers, and the system of levying fees for such purposes should be abolished. It is anomalous that fees on applications before Customs, Income-tax and such other Revenue authorities, functioning under the Centre, should be by means of Court Fee stamps issued by the State authorities.

TAXES ON MOTOR AND OTHER VEHICLES

The Motor Vehicles Taxation Enquiry Committee have dealt with, in great detail, the defects and drawbacks of the existing scheme of taxation of motor vehicles. The Committee have pointed out that the motor vehicles taxation in India is the highest in the world and have traced the stages by which the various taxing authorities, viz., the Centre, the States and the Local Authorities have been imposing increasing burdens on the motor vehicle user from time to time. They also deprecate the tendency to treat motor vehicles as items of luxury for purposes of taxation both by the Centre and by the States. Under the present conditions of work and life, motor vehicles come in the category of necessities of life. The present level of taxation is responsible for the low *per capita* ownership of vehicles in this country. The checks on the capacity to own and run a vehicle imposed by the present scheme of taxation also throws a handicap on the growth and development of the automobile industry. The enormity of the burden can be realised from the findings of the Committee that the average goods lorry pays by way of Central and State Taxes alone twice the average earnings per ton mile of goods carried by rail. The existing tax incidence is composed of distinct or separate levies under the following heads or categories:

- (1) Customs and Excise duties levied by the Central Government.
- (2) Petrol tax or fuel tax levied by the Central Government.
- (3) State Petrol Tax, Motor Vehicles Tax, Sales Tax on Motor Vehicles and accessories, and registration and other fees levied by the State Governments.
- (4) Octroi duty, Terminal Taxes, Tolls, Fees, Wheel Tax, Vehicle Tax other than Motor Vehicles Tax, Road Tax, Road Cess, etc., levied by Local authorities.

The Motor Vehicles Taxation Enquiry Committee estimated that the annual taxation on a light passenger car in the State of Bombay amounted to Rs. 953, on a medium car to Rs. 1,612, on a motor lorry to over Rs. 5,000 and on a bus to Rs. 6,444. Since then, the rate of provincial taxation was increased in Bombay in the year 1952 in a substantial manner.

There is overwhelming support for the point of view that the present burden of taxation is coming in the way of expansion of motor transport and this form of transport is playing its proper role in the development and progress of the economy of the country. There is

a strong case for relief and in reviewing and suggesting re-adjustments in the existing basis and scheme of taxation of motor vehicles, the Commission will naturally, give due consideration and importance to this claim for relief from the present level of taxation.

Question 168.—*Taking into account (a) the several taxes Central, State and Local, which affect motor transport directly and business, trade, etc., indirectly, (b) the variation in some of these taxes from region to region and between different categories of vehicles and (c) the relative financial needs of the different taxing authorities, both generally and, in particular for the maintenance, improvement and extension of roads, what changes, if any, would you introduce in the present system of motor vehicles taxation? What degree of uniformity do your suggestions involve? Instead of several taxes by different authorities, a consolidated tax has been suggested: do you consider this feasible? How would you apportion the proceeds among the different authorities concerned?*

We would advocate a uniform scheme of motor taxation applicable to the country as a whole. There is no difficulty so far as the taxes levied by the Centre are concerned, because such taxes operate on a uniform basis. So far as the States are concerned, State taxation should be confined to two heads, viz., State Fuel Tax or Petrol Tax and the State Motor Vehicles Tax. All other taxes by the State as also by the Municipal authorities should be abolished. State Sales Tax on petrol should be merged with the Central Petrol Tax and collected by the latter.

Apportionment of the proceeds of the consolidated petrol tax should be by a formula linked to petrol consumption in each State. A weightage may be given for meeting the requirements of underdeveloped areas and for assisting special road programmes approved by the Centre. Provision will also have to be made for compensating Municipal and Local authorities for the loss of revenue on account of Wheel Tax and Octroi and the basis of compensation should be linked to the expenditure to be incurred by such authorities for the upkeep of roads in their charge.

Question 169.—*To what extent and in what manner, in your view, should the proceeds from motor vehicles taxation be earmarked for road maintenance and development?*

As mentioned earlier, the divisible portion of the proceeds of consolidated Petrol Tax should go to the different States in proportion to the petrol consumption in the respective States. The share of the proceeds of used only for purposes of road development. The States Motor Vehicles Taxation Enquiry Committee, to a non-lapsing road fund, and the money in the fund should be used only for purposes of road development. The States should also continue to contribute from the General Revenues for community use of roads as they have been hitherto doing and such contributions should also go to the credit of this non-lapsing fund.

Question 170.—*Have you any specific comments to make on the main recommendations of the Motor Vehicles Taxation Enquiry Committee, 1950?*

We are in general agreement with the main recommendations of the Motor Vehicles Taxation Enquiry Committee. In particular, we endorse the suggestions made therein for assisting the pace of road development.

Question 171.—*Have you any suggestions to make regarding the extension of taxation to, or increase of present taxation on, users of roads other than motor vehicles? How would you classify the users, what rates would you suggest and who, in your view, should be the taxing authorities? How would you dispose of the proceeds?*

As the general tax-payer is expected to contribute to a moiety of the expenditure for the upkeep of roads for the community use of such roads, we do not consider that users of roads other than motor vehicles need be called upon to pay the special or additional tax. Suggestions have been made in the past, which suggestions have also received the support of the Motor Vehicles Taxation Enquiry Committee, that bullock carts, used as public carriers, should be required to pay a special tax for the use of the roads.

Entertainments Tax

Question 172.—*This tax is usually levied on tickets of admission to entertainments or amusements, of which the cinema is by far the most important. In this regard, the Cinematograph Industry Enquiry Committee considered the incidence of the tax on the industry too heavy. Do you agree with this view and, in particular, do you consider that the rates have reached the point of diminishing returns?*

The Committee also suggested uniformity in the rates of duty which differ widely from State to State.

Do you agree with this view? If so, how should it be achieved?

How far would you apply graduation in the rates of entertainments tax?

What modification in the system of levy would you suggest?

We are in general agreement with the views expressed by the Film Enquiry Committee that the burden of the Entertainment Tax on the Film Industry is very heavy and that the rates have reached the point of diminishing returns. The observations of the Film Enquiry Committee equally apply in so far as the effect of the tax on other forms of entertainments are concerned. Apart from the steep progression in the rates of the tax, as commented by the Film Enquiry Committee, the present method of assessing tax on the basis of the net amount paid to the theatre owner, instead of the gross amount paid by the public, is leading to anomalous results. For instance, under the existing arrangement, if an Exhibitor in Bombay wishes to raise his share of the admission price from 4 annas to 6 annas, he will have to raise the price of the ticket from 5 annas to 8½ annas, i.e., for an effective increase of 2 annas in the price yield to the Exhibitor, the gross increase has to be of the order of 3½ annas. The rate of the tax has also been substantially increased between the years 1938 and 1953. In Bombay, for instance, for a ticket priced between Re. 1 and Rs. 2 the tax was 4 annas in 1938; at present it is 10 annas, and for a ticket priced between Rs. 4 and Rs. 5 it was 12 annas in 1938 and it is Rs. 2 at present. The effect of the present level of tariff is reflected in the collections from Entertainments Tax in the three major States during the last three years:

Collections of Entertainments tax
(In lakhs of Rupees)

Year	Bombay	Madras	West Bengal
1950-51	172.85	123.89	105.02
1951-52	177.0	126.39	109.77
1952-53	156.88	119.28	104.33

It may also be generally stated that the burden of the Entertainments Tax has been, to some measure, responsible for the comparative elimination of the Musical and Dramatic form of entertainments. We are entering a period of general depression in activities and the set-back caused by the present level of the incidence of the Entertainments Tax would be more evident in the years to come. There is, therefore, a strong case for a substantial scaling down of the present rates of the Entertainments Tax.

It is desirable to achieve a large measure of uniformity in the rates of duty which, at present, vary widely as between the different States. In view of the constitutional position, the Centre should, through the machinery of the periodical Finance Ministers' Conferences, exercise friendly and informal pressure on those guiding the destinies of the States to bring about uniformity by common agreement. At any rate, the States must be persuaded to agree to the upper and lower limits of the rates of duty, as also the basis of the levy viz., whether it should be a specific rate or an *ad valorem* rate. If uniformity in regard to all aspects of details is not found possible, at least if there is agreement on the ceiling to be fixed and on the basis of the levy, a good beginning may be considered to have been made.

We are not in favour of a system of graded rates. We share the view expressed by the Film Enquiry Committee that an *ad valorem* basis of levy representing a specified proportion of the price charged for the ticket would be desirable. However, if, ultimately, some gradation is considered unavoidable, the gradation should also be on the basis of an *ad valorem* percentage rate, i.e., tickets upto a prescribed value bear a specified percentage of the value as duty and tickets over that value bear a specified percentage of the higher value as duty.

As mentioned earlier, the present rates of the levy are high and are having a regressive effect. The Film enquiry Committee had suggested that the tax should be fixed at the level of 20 per cent. of the gross takings. Even that rate, in our opinion, would be heavy. In the altered economic conditions now emerging, we believe that the rate should not exceed 12½ per cent. of the gross takings for all categories of seats.

Question 173.—What principles would you adopt in regard to exemptions? Should the criterion be:

(i) character of the entertainment (e.g., educational film);

(ii) nature of object to which net receipts are applied (e.g., charity show);

(iii) class of persons admitted to entertainment (e.g., lowest class of ticket);

(iv) any other factor?

The general consideration which should weigh in determining the policy governing exemption should be that wherever collections from the entertainment are not intended for private benefit and the scope of the activity connected with the entertainment is not of a commercial character, the same should not be attracted by the levy of the tax. Judged from that standpoint, (i) entertainment by educational films should be exempt; (ii) entertainment for furthering any cause ensuring to public benefit, e.g., assistance to charity, should be free (iii) entertainments organised and conducted by Societies and Clubs for the exclusive benefit of their members should be free from tax liability, more so when the sale of tickets to outsiders is not intended and the right of admission is strictly limited to members. There are many Associations working in the sphere of promotion of art and culture, functioning for the purpose of encouraging and advancing the finer arts, such as music, dance, drama, etc. The present procedure and practice is that, apart from the tickets sold to outsiders on such occasions being taxed, the Association or the Club is again taxed on an assumed gate-money calculated with reference to the number of members who had attended although the entertainment might have been free for members.

The present procedure in some States of attaching some tax liability to complimentary passes is not justified. However, to check the number of free admissions, a maximum number for a particular show or entertainment may be fixed. Regarding complimentary tickets, the position, at any rate, in Bombay is that such tickets are calculated for purposes of liability to tax. If that position is to continue, a minimum number of complimentary tickets should be excluded. Complimentary passes upto a prescribed minimum should be free.

Apart from complimentary passes, even admission of special guests by invitation appears to attract tax. This is not proper. The organisers of an entertainment may find it necessary to invite a large number of distinguished persons, having regard to the circumstances connected with the entertainment to a particular event. Just because general admission to such entertainment is by tickets, the presence by invitation should not be taken into account for arriving at tax liability.

Question 174.—How important is evasion of the entertainments tax and what methods of evasion are practised? What steps would you take to minimise evasion? Should there be a restriction on the number or proportion of complimentary tickets issued? Should collection be more generally by stamps?

From the nature of the organisation of the Cinema industry particularly, the scope for organised efforts to evade tax liability appear to be limited. There are two essential agencies involved in checking independently the collections from a show. The distributor is interested in finding out the actual number of persons who have attended the show, for his share of the takings, and the same will have to be determined by reference to such day-to-day or periodical check. The Exhibitor, naturally, will not give a set of figures to the tax collecting authority different from that given to the distributor. The existence, thus, of an automatic check in the organisational set-up as above, reduces, we feel, the chances of anything like a system of organised evasion. Moreover, if the rates of the duty are reduced, the inducement to evade will also be absent.

Question 175.—Would you suggest the extension of the scope of application of the tax to any other organised and conveniently taxable forms of entertainment not taxed at present? Would you recommend the exclusion from the scope of the tax of any kind of entertainment which is taxed at present?

All forms of entertainments which have a commercial significance are at present taxed. Moreover, even entertainments organised by Associations functioning for public benefit are also taxed. There is, therefore, no scope for extending the tax to more forms of entertainment. On the other hand, there is a strong case for exempting entertainments designed primarily for the purpose of developing the cultural side of social activities. In that category dramatic performances, and musical concerts particularly, when organised by non-profit-making bodies, should be completely exempt.

Tax on the Consumption or Sale of Electricity

Question 176.—A tax on the consumption or sale of electricity is levied in several States in India? Do you consider that this is a suitable tax and may be adopted by other States? Would you restrict it to consumers of energy for domestic purposes or would you extend it to sales for industrial uses also?

A direct tax in the shape of an Electricity Duty on the consumption of electrical energy was first introduced

in the State of Bombay in the year 1932, then as a temporary measure. It was confined to domestic consumption of electrical energy till the year 1948. The tax is since then being imposed in a number of States. Its incidence and scope vary from State to State and what is more, even in the same State they vary from area to area. The magnitude of the changes in the rate and scope of the levy is indicated by the fact that whereas in the year 1938/39 the total yield from Electricity Duty was only Rs. 18 lakhs, it rose to Rs. 85 lakhs in the year 1948/49, i.e., nearly five times over. From 1949 the tax is being levied on energy used for industrial purposes also and from that year onwards there has been a sharp increase in the revenues from this source. It has gone up to Rs. 200 lakhs in the year 1953/54 as against Rs. 18 lakhs in 1938/39, an increase of over 11 times. It must also be prominently noted that the diversity in rates and scope as between the different States introduces an unhealthy element of unequal conditions in regard to the functioning of enterprises and undertakings. In Bengal the duty is charged only on energy used for domestic purposes. In Orissa and Delhi, there does not appear to be any duty on electricity. In Madhya Pradesh the duty is only for domestic consumption. So far as Madras and the U. P. are concerned, the rates are considerably lower than those in force in Bombay. In fact, the incidence of the duty is the highest in Bombay.

The duty on electricity used for industrial purposes has been considered to be a tax on "an initial instrument of technological development". The rate for this levy is three pies per two units against the normal price of six pies per unit charged to the ordinary industrial consumer. So in the case of the average ordinary industrial consumer, the increase amounts to a 25 per cent. surcharge on the cost of energy. Again the cost of power in itself is the highest in India in the world. It has been estimated that the duty at 1½ pies per unit represents an increase in cost to the extent of 33½ per cent. in certain cases according to the tariff applicable to special loads and connected factors. Such a heavy impost on electricity consumed for industrial purposes is inconsistent with the overriding need, at the moment, for reducing cost of manufacture and increasing production.

The tax on the consumption of electricity for power purposes, in our opinion, is not a suitable tax and it should be abolished wherever the same is in force. In the case of energy consumed for domestic purposes also, the tax is deemed to be a levy on health and the normal minimum amenities of the average citizen. If the levy has to be continued, it is to be kept at a nominal level, there being an initial tax-free slab so that the smallest type of domestic consumers are not attracted by the same. In the City of Bombay, no duty is payable on consumption of energy below 12 units per month. This may be increased to at least 18 units.

While on this, we would like to bring to the notice of the Commission that there is an overwhelming support for the point of view that the present practice of levying a fixed sum per unit rate basis, should be replaced by a percentage basis of levy, computed with reference to the selling price of energy. Such a procedure is advantageous from practical considerations.

Question 177.—*In respect of domestic purposes—*

(a) *should a distinction be drawn between the electrical energy consumed for lights and fans and the energy consumed for other domestic purposes (fridges, heaters, radios, etc.)? On what principles would you determine the rates of duty?*

(b) *what exemptions would you suggest and on what basis? Would you apply a lower rate of duty to small consumers?*

(a) The connotation used for domestic purposes, perhaps, requires to be reconsidered. By reason of the provision for household amenities, the use of many labour-saving equipments is common and even as it is, the energy used for such purposes now is not chargeable at the same rate as that used for residential purposes, viz., lights and fans. Thus, the distinction is in force even now and energy used for such household equipment is on the lower basis applicable to industrial use. As mentioned earlier, we are not in favour of duty on consumption of electricity. If the duty, however, is to continue, it should be confined to the consumption of electricity for residential purposes over a tax-free quantum and the rate for such consumption should be on a percentage basis and at all events, should not exceed 10 per cent. of the basic cost of the energy.

(b) We have already suggested that in the case of industrial consumers, there should be no tax. So the question of distinction for purposes of differential basis does not arise. We have also suggested that to give relief to the lower middle-class and poorer sections of the society, the duty-free quantum of consumption should be fixed at 18 units per month in a place like the City of Bombay.

This tax-free slab should be available in the case of a consumer whose consumption exceeds the limit such consumer being liable only to the excess over the tax-free limit. The present practice is that when consumption exceeds the tax-free limit, the whole consumption is liable to tax.

Question 178.—*If you are in favour of a duty on energy used for industrial purposes, on what principles would you determine the rates of duty? What exemptions would you provide for and on what basis?*

If the duty is to be continued, the present practice of exempting undertakings controlled or owned by the State or Local authorities should go, as the discriminatory treatment of private enterprise is not at all justified. Again, as mentioned earlier, if in all cases where the duty is found to operate heavily, i.e., exceeds 10 per cent. of the total cost of production, the factory-owners should be exempted.

Question 179.—*How would you modify your suggestions in reply to the foregoing questions if electrical energy—*

(i) *is entirely supplied by Government undertakings in a State,*

(ii) *is supplied by Government undertakings in some areas of a State and private undertakings in other areas?*

(i) Electricity duty, if it is to be levied is a levy on the consumer and any distinction based on the ownership of the source of supply is irrelevant. Even where the generating or distributing undertaking is owned by Government, the principle or the basis governing the levy of the duty should remain the same.

(ii) The same consideration should apply in the case of areas where supply is through both the types of undertakings.

Question 180.—*What degree of uniformity as between different States would be desirable in regard to the levy of electricity duty? How would you achieve it?*

In our preliminary observations re: Q. 176, we have already indicated the unequal conditions created by the diversity in rates and basis of the levy of the tax. For example, enterprises and manufacturing undertakings located in a State like Bombay, having the highest rate of electricity duty suffers a handicap in regard to its competitive capacity vis-a-vis products of industries located in areas where the burden of the levy is substantially lower. Therefore, the need for uniformity particularly in the case of energy used for power purposes cannot be over-emphasized. By common consent or agreement, the different State Governments should be persuaded to levy a uniform rate of duty. Perhaps, this could be achieved by informal efforts made at the time of periodical conferences of Government representatives, in the Industrial Advisory Council or in other similar gatherings.

Betting and Prize Competition Taxes

Question 181.—*The betting tax is confirmed in practice to horse racing. Have you any suggestions to make regarding the rates of betting tax, the manner of levy of the tax, and the measures which may be adopted for minimising evasion of the tax?*

The primary consideration which should weigh with the authorities in regard to the basis and scope of taxation on betting should be that the level of taxation should not be such as to have a regressive effect on the activity as also to ultimately eliminate the same. Being pastimes of a luxury character, in principle the taxation of these activities may not be objected to. But the rate of tax should be reasonable and in any case should not be such as to produce a discouraging effect on the conduct of the activity as such. So far as betting through the medium of racing is concerned, there are two or three types of taxes. There is, firstly, a licence fee charged to the recognised Turf Club. This was first introduced in 1939/40. The annual fee charged was Rs. 3 lakhs in Bombay. It has been subjected to successive increases and at present it is of the order of Rs. 12½ lakhs. There is then the tax on admission to the Race Course, in the nature of a surcharge on the ticket. Admissions to the race course are taxed in Bombay at the rate of 37½ per cent. *ad valorem*. Then again racegoers themselves pay a tax in the shape of a levy on the stake amount. In 1939 the rate was 4 per cent.; in 1943/44 this was raised to 8 per cent., in 1948/49 it was again raised to 10 per cent. Government are armed with powers to raise it up to 12½ per cent. Notwithstanding these substantial increases, so far as the Bombay State is concerned, during the course of the last Budget discussion, the Government spokesman gave the information that the revenue from this source, had declined. The suggestion made earlier that the level of taxation should not be such as to discourage or eliminate the activity is thus reinforced.

Question 182.—*Do you consider it practicable to extend the betting tax to other forms of betting? To which and how?*

We are not aware of any other organised and legal form of activity involving betting on a substantial scale. If licensed betting in other spheres on a substantial scale exists, the possibility of evolving proposals for taxing the same may be considered. Lotteries run under the control and supervision of the State offer possibilities of some additional revenue in this sphere.

Question 183.—Have you any suggestions to make regarding the tax on prize competitions, e.g., on crossword puzzles? To what extent is uniformity between States desirable in regard to rates, etc., and what steps would you take to bring about such uniformity? What suggestions can you make in regard to preventing evasion or avoidance of the tax?

It would be desirable to secure uniformity as between the different States in regard to the rates and the basis of tax on competitions and crossword puzzles. The diversity in rates and practices, it is noted, has led to such activity being transferred to areas where the obligations were found to be less onerous. In the case of Bombay, for instance, the revenue under prize competition was over Rs. 24 lakhs in the year 1951/52 and it has gone down to Rs. 13 lakhs in the year 1953/54, some major undertakings engaged in this activity having transferred their sphere. In their anxiety to tax this source to the maximum extent possible, the States concerned should take care to see that the higher rates charged by them do not ultimately result in the activity sought to be taxed being altogether removed from their tax jurisdiction. Perhaps, the introduction of the recovery of the tax by a system under which the competitor affixes the same in the shape of stamps on the coupon or the Entry form to be used, may result in minimising the chances of evasion.

Miscellaneous Taxes and Fees

Question 184.—Have you any comments or suggestions regarding any other taxes, cesses or fees (e.g., excise on opium, probate and succession duties, registration fees) not covered by Parts II to V of the questionnaire?

NOTE.—Questions relating to certain taxes levied by Local Bodies as well as State Governments are included in Part VI dealing with local taxation.

One general observation which we would like to make is that licence fee or fees for registration for purposes of any activity should be only on a nominal scale. The system of licensing for any activity or trade should not be used as a revenue gathering process. For example, when licensing for cloth trade was introduced in Bombay, there was a good deal of grievance that the scale of licence fees was abnormally heavy. After all the trade is being taxed in other ways. Fees for licence should be merely a formality and confined to cover incidental expenditure involved in issuing such licences.

Referring to probate and succession duties, with the introduction of the scheme of Estate Duty, the former levies are no longer justified and should go. At all events, if they are continued, payments by way of probate or succession duty should, as a matter of course, be allowed as full deduction in computing liability to Estate Duty.

PART VI.—LOCAL TAXATION

General

Local Self-Government is the very basis of democracy and the local bodies—city corporations, municipalities, district local boards and village panchayats—are the foundations of the stable structure of society. Our Constitution has laid great stress on this and the establishment of village panchayats has been listed as one of the directive principles of State policy. The finances of local bodies would, therefore, require increasingly greater attention in future as such a study of local finance assumes the utmost importance.

The services that the local bodies are required to perform are the following:—

- (1) Education,
- (2) Public Health and Sanitation,
- (3) Medical relief, and
- (4) Public works.

The Financial resources at the disposal of local bodies are of two kinds:—

- (1) Tax revenues, and
- (2) Non-tax revenues.

Tax revenue comprises of the following:—

- (1) Taxes on property,
- (2) Taxes on trade,
- (3) Taxes on persons, and
- (4) Fees and licences.

Non-tax revenue generally comprises the following items:—

- (1) rents of land, houses, rest houses and dak bungalows,

- (2) sale proceeds of land and produce of land,
- (3) fees and revenue from educational institutions,
- (4) fees and revenue from medical institutions,
- (5) fees and revenue from markets and slaughter houses,
- (6) fees and revenue from commercial undertakings, such as motor buses, tramways, electric supply, etc.,
- (7) interest on investments, and
- (8) Government grants.

Taxes on property fall under the following classes:—

- (1) tax on buildings and lands,
- (2) cess on lands, generally with reference to their use for agricultural purposes,
- (3) tax on unearned increment in connection with betterment schemes, and
- (4) tax in the shape of a surcharge on stamp duty on transfers of property.

Taxes on property are important in Madras, Bombay, West Bengal and Madhya Pradesh. Cess on land is the main source of the district boards. Betterment taxes are not of much importance financially. Surcharge on stamp duty, on transfer of property, is levied only in Madras State and by the Calcutta Improvement Trust.

Taxes on trade are mostly octroi and terminal taxes and are important principally in East Punjab, U. P., Bombay and Madhya Pradesh. Tolls have been abolished everywhere except in one or two States.

The principal taxes on persons now levied by local bodies are the following:—

- (1) taxes on circumstances and property in Madhya Pradesh, Uttar Pradesh, Bihar and Orissa,
- (2) tax on professions, trades and callings in Bengal, Madras, Uttar Pradesh, Madhya Pradesh and Punjab,
- (3) a tax on companies in Madras,
- (4) a tax on pilgrims in Madras, Bombay, Uttar Pradesh, Madhya Pradesh, Bihar and Orissa,
- (5) a terminal tax on passengers in Calcutta, and
- (6) a tax on motor bus passengers in Bihar.

Fees and licences are numerous and are levied by almost every municipality in India. This may be classified under three principal heads:—

- (1) fees for specific services rendered by the municipality such as private scavenging,
- (2) fees which are partly in the nature of luxury taxes and partly for purposes of regulation, such as licences for music, vehicles, dogs and other animals, and
- (3) licence fees, the primary object of which is regulation, such as fees for offensive and dangerous trades.

The position, so far as Bombay State is concerned, is as follows:—

At present there are three city corporations, viz., Bombay, Poona and Ahmedabad. Maxima and/or minima for certain taxes are laid down. Subject to these limits, the corporations have full liberty to levy taxes permitted to them by law without reference to Government. Local bodies other than municipal corporations, have no independent powers of taxation.

Before dealing with the questions relating to the local taxation, we would like to preface our replies by some general observations relating to the fundamental problems.

Local finance, and for that matter, finances in any sphere, have necessarily two equally vital aspects, viz., income and expenditure. Both are closely interrelated and interdependent. The study of local finance should not, therefore, merely be confined to the income aspect, i.e., sources of income like taxes, rates, fees, and grants-in-aid. It has necessarily to be correlated to the simultaneous study of the aspect of expenditure of the local bodies also. Unfortunately, the Local Finance Enquiry Committee, which went into the whole question of local finance, confined themselves mainly to the raising of more income only. They have based their observations on the present structure and basis of local bodies and have refrained from suggesting any structural changes in the present set-up of the local bodies to improve the finances available to local bodies, for fear that they were outside the scope of their terms of reference. For instance, during the course of the evidence before the Committee, it was pointed out that with the tendency to transfer of functions from district boards to State Governments and the policy of establishing panchayats in practically every important village, district boards will have very little work to do in the near future and the question of their abolition as a measure of economy was put to them. Again, in Uttar Pradesh, where a large number of village panchayats have been established, the question of co-ordination of functions between district boards and village panchayats had been referred

to the committee by the State Government. The Committee expressed no opinion on these points as they had to frame their recommendations on the basis of the existing structure of local bodies. Besides this aspect of overall importance, the Committee has overlooked another significant aspect of improving the financial position by economy and efficiency in administration. Even some of the members of the Committee themselves felt that this aspect should have been more thoroughly investigated by the Committee with a view to suggest measures to improve the machinery for budgeting, accounting, assessment and collection of taxes, recruitment and control of personnel, etc. If the Committee had probed into the above two aspects of local taxation, it would have not been faced with the only alternative of expanding the revenues by increasing taxation both in the matter of rates and the scope. It is hoped that these aspects will receive due consideration at the hands of the Taxation Enquiry Commission. The *per capita* tax paid to the local bodies is fairly high in relation to the services rendered. According to the estimates of the Local Finance Enquiry Committee, in the year 1946-47 the *per capita* local taxation was Re. 0-4-1 in rural areas, Rs. 4-11-10 in municipal areas and Rs. 18-12-3 in corporations. During the next 3 years local taxes were further increased by about 30 per cent. Considering the fact that the *per capita* total income of the people in India is very low and that land revenue is not included in the local taxation, the level of local taxation in India is understood to be more than that in many of the Western countries.

An important finding of the Local Finance Enquiry Committee is that the field and scope for taxation by local bodies in India is very limited and requires widening. Almost in all the States, the State Governments have encroached upon the field which was reserved for local bodies prior to the year 1935. The Government of India Act of 1935 repealed the rules regarding scheduled taxes which were previously reserved for local bodies. The Act provided for 3 lists, viz., Federal, Provincial and Concurrent. The previous 'Scheduled taxes' were included in the Provincial List without any indication that the taxes in question were reserved for local authorities. This change has proved rather unfavourable for local authorities, as State Governments have, in certain cases, utilised what were previously recognised to be purely local taxes for their own purposes.

This position continued in the new Constitution of India. Some of the former local taxes like the Terminal Tax are included in the Union List, while the majority are included in the State List. In some States, taxes on property and in others, taxes on professions, trades, callings and employments are being used for the purposes of the State, though proceeds were meant to be allocated to local bodies. Another disquieting feature of the present system of local finance is that the States have deprived the local bodies of their lucrative sources of revenue from the running of the public utility undertakings. Some big local bodies are best suited for transport services, electricity distribution, etc., which incidentally provide good revenue.

Thus left with a very few sources of income, the local bodies have to mainly depend upon grants-in-aid from the States. If the reasonable grants are not forthcoming, then the local bodies try to either increase the rate of taxes in the sphere of their jurisdiction or to expand the field of the existing taxation. Generally, the burden of the increased taxation is always sought to be imposed on the industrial or commercial sector out of the fear of opposition from the public if the same is broad-based. Thus during recent years, many municipal authorities have increased their rates of octroi duties or have roped in more and more commodities for taxation. In their frantic efforts in search for increased revenue, consideration is hardly given to the fact whether the industry or trade as a whole will suffer or not, with the result that the additional imposts greatly hamper trade and substantially add to the cost of production.

The Local Finance Enquiry Committee has, therefore, rightly recommended that the progress of provincialisation of tax resources should be checked and more and more sources of revenue should be made available to them. In order that the local bodies do not misuse their powers, they have also suggested certain safeguards such as statutory limits of maximum and/or minimum of taxes, etc. We are in general agreement with the committee in their suggestion regarding the reservation of the following taxes for the local bodies:—

Union List

- (1) Item No. 89:

Terminal taxes on goods or passengers carried by railway, sea, or air.

State List

- (2) Item No. 49:

Taxes on lands and buildings.

- (3) Item No. 50:

Taxes on mineral rights subject to any limitations imposed by Parliament by law relating to mineral development.

- (4) Item No. 52:

Taxes on the entry goods into a local area for consumption, use or sale therein (octroi).

- (5) Item No. 53:

Taxes on the consumption or sale of electricity (the rate should be nominal).

- (6) Item No. 55:

Taxes on advertisements other than advertisements published in the newspapers.

- (7) Item No. 58:

Taxes on animals and boats.

- (8) Item No. 59:

Tolls (if they are continued).

- (9) Item No. 60:

Taxes on professions, trades, callings and employments.

- (10) Item No. 61:

Capitation taxes.

- (11) Item No. 62:

Taxes on entertainments including amusements (within city or municipal limits).

This could be done by the centre persuading the State Governments to statutorily lay down that these particular items now mentioned in the State List be exclusively made available to the local bodies or by sharing the revenues from these sources in some fixed proportions. The item of Terminal Tax may be transferred to the Provincial List for local bodies by a change in the Constitution. As stated earlier, the local bodies should also be empowered to manage the public utility undertakings such as road transport, electric supply, etc., within their limits, to the extent that they have already been transferred to the public sector. All the above measures are suggested because, in our opinion, there is at present very little scope for increasing or expanding the existing sources or rates and scope of the existing local taxation. Many of the recommendations of the Local Finance Enquiry Committee to increase existing local taxation are, in our opinion, not justified.

Coming to the questionnaire proper, questions No. 185 to 199 which generally pertain to the powers of taxation of local bodies, transference of tax power from the State List to the local bodies, grants-in-aid, etc., are dealt with by the general observations made above. Our suggestions in this regard may be summarised as below:

- (1) Local taxes being generally in the nature of charges for services rendered, sufficient funds should be made available to them so that the essential services rendered by them may not be curtailed on account of lack of funds.
- (2) For this purpose, local bodies should not be made dependent upon grants from the State Governments as far as possible, but should have their own independent powers of taxation within fixed limits. It must, however, be provided that the same sphere should not be taxed by the two taxing authorities, viz., State Governments and Local Authorities. The State Governments should not be allowed to interfere with these powers. This could be done by statutorily laying down these particular sources of taxes exclusively for local bodies.
- (3) If in some cases this is not found feasible, then in those cases, a fixed percentage of revenue derived may be earmarked for the local bodies.
- (4) Grants-in-aid should be resorted to only in the last resort. Even grants-in-aid should be given on the scientific and pre-determined basis such as population, rateable value of properties, density of population, number of school-going children, etc. No departure from this standard basis should be made.
- (5) In so far as the existing system is due to the defect in the constitutional framework, the Constitution should be amended to that extent.

So far as matters of relative details are concerned, the local bodies and State Governments would be exhaustively dealing with them. We have, therefore, confined ourselves to the matters of broad policy.

Taxation on Properties

Question 291.—If the question of valuation was confined to the levy of urban immovable property tax by States and general property tax by local bodies, what basis would you adopt: capital value or annual rental value? Do you agree with the recommenda-

tion of the Local Finance Enquiry Committee that "there should be no change from the well-tried basis of rent to the more or less uncertain basis of capital value", but that where "municipalities are actually adopting capital value as the basis and there is no complaint, that basis may continue"?

Taxations on property are determined either on the basis of the capital value or annual rateable value of the property. The computation of the capital value of the property is a very complicated process and leads to a certain extent to corruption. Besides, the income on that basis would be highly fluctuating with the deviations in the capital value of the property from year to year. In recent years on account of the inflationary conditions obtaining in the country, the capital value of the property has risen by three to four times the pre-war capital value. It would, therefore, be unfair to levy taxes on the basis of this high capital value of the property.

The taxes on the basis of the annual rateable value of the property are in the nature of taxes on a national income. They even comprise taxes which are deemed to be income of a property owner with the result that he has to pay tax on taxes. The better and the more realistic method is to assess tax on the basis of rents actually recovered or recoverable. We are, therefore, in general agreement with the recommendations of the Local Finance Enquiry Committee "that there should be no change from the well-tried basis of rents to the more or less uncertain basis of value", but that where, "municipalities are actually adopting capital value as the basis and there is no complaint, that basis may continue".

At present in some of the States in India the alternative bases of assessment are in existence. The choice of the basis, however, does not lie with the owner of the property but is left exclusively to the judgment of the executive authority of the municipality. This, in our opinion, would induce the municipal authorities in these States to manipulate the basis according to their own choice and thus subject the property-owners to the highest possible tax. We, therefore, suggest that such alternative basis of computation should go and only rental basis should be retained.

Question 202.—As regards the urban immovable property tax, the Local Finance Enquiry Committee says in effect that, even though property tax generally should be left to be exploited by local bodies, it would be both expedient and suitable for the Government (i) to levy an urban immovable property tax when a municipality fails to levy a property tax in spite of a statutory obligation to do so or (ii) to continue to levy the tax when a municipality refuses to increase its property tax to the extent the State Government is prepared to reduce its urban immovable tax. Do you agree with this view? Have you any other comments to make on the urban immovable property tax? If you consider it a suitable form of taxation for the States, what modifications, if any, would you suggest in regard to exemptions, rates of levy, mode of assessment and procedure for collection?

At present Urban Immovable Property Tax is levied in two States only, viz., Bombay and Punjab. In Bombay, it is levied in the three cities, viz., Bombay, Poona and Ahmedabad. The receipts on this account have risen from over 100 lakhs in 1938-39 to Rs. 151 lakhs in 1953-54. The burden of the Urban Immovable Property Tax is not at present allowed to be passed on to the tenants by the enactment of the Rent Act. In the beginning Government had accepted the principle of reducing the rates of Urban Immovable Property Tax with the corresponding increase in the municipal tax on property, but afterwards, Government decided that where the municipal tax was 21 per cent. or more of the rental value of the property, the maximum rate of Urban Immovable Property Tax should be reduced by 2 per cent. only. Thus, when the rate of municipal tax was raised from 14½ per cent. to 17½ per cent. from 1st April 1952, Government reduced the rate of Urban Immovable Property Tax in Bombay from 7 per cent. to 5 per cent. only for properties whose rateable value was Rs. 2,000 or above and from 3½ per cent. to 2½ per cent. for properties whose rateable value varied between Rs. 500 and Rs. 2,000.

We are of the opinion that the property tax is a tax particularly suitable for exploitation for local bodies and it is, therefore, desirable that the State Government should withdraw from this field on the condition that an equivalent local tax is imposed by the municipality. The Local Finance Enquiry Committee also recommended that "in the place of the present optional provision for the levy of the property tax in the various Municipal Acts there should be obligatory provision as it is in the Acts constituting the City Corporations of Bombay and Calcutta. Should, however, any municipality failed to levy tax in spite of such statutory provision, the State Governments should have the power to levy tax at such

rates as they deem fit in any municipal area for the benefit of the municipality". The Committee, therefore, suggested that this power should be exercised by the State Government only when a municipality has refused the advice rendered to it by the State Government in the first instance.

In Bombay, the total burden of the tax on property, viz., Urban immovable Property Tax, the general property tax, the water tax, conservancy tax, lighting tax and various miscellaneous taxes is of the order of 29½ per cent. of the gross returns of the property owners derived from rents. This in itself constitutes a very heavy burden on the property owners and there is, therefore, a strong ground for an all-round reduction of the tax on property. The high incidence of the tax on property is also reflected from the fact that the building industry today is in a very depressed condition with the result that an acute housing shortage particularly in towns and cities is prevailing today. When any municipality refuses to levy a property tax in spite of the statutory obligation to do so, there may be good and valid reasons for a municipality to do so. The municipality may have a desire to provide a degree of elasticity to its tax structure and thus may leave a gap between the permissible rate and the actual rate which may be filled up later. In such circumstances it would, therefore, be not justifiable for the State Government to encroach upon local field and fill up this gap and keep the municipal income from these sources fixed and rigid. When once the Government have filled up the gap it would be very difficult for the municipal authorities to derive any additional income from the sources because the State Government may not always be willing to withdraw the additional impost because the relation between the Government and the municipality may not always be cordial if the parties in power are different in the two places. We are, therefore, not in agreement with the suggestion of the Local Finance Enquiry Committee that it would be both expedient and suitable for the Government (i) to levy an Urban Immovable Property Tax when a municipality fails to levy a property tax in spite of a statutory obligation to do so or (ii) to continue to levy the tax when a municipality refuses to increase its property tax to the extent the State Government is prepared to reduce its Urban Immovable Property Tax. It would be proper, in our opinion, if the field of the property taxes is entirely left only to the local authorities and State Governments withdraw from it. After all, local authorities are in the best position to measure correctly the burden of taxation on property-owners and thus left to themselves, they would be adjusting the rates as the exigencies of the local situation require, within the prescribed limits.

We would, therefore, suggest that the Urban Immovable Property Tax wherever it exists should be progressively reduced and be amalgamated with the general property tax levied by the local authorities.

One of the defects in the procedure for levying the Urban Immovable Property Tax in Bombay may be mentioned here. At present in Bombay the properties whose rateable value is below Rs. 500 are exempted from the Urban Immovable Property Tax. Properties of rateable value below Rs. 500 were assessed separately till 31-3-1952. The Bombay Finance Act, amended in 1948 providing for grouping of properties in a locality is since being applied to such properties. The amending Act provides that properties belonging to one owner and situate in one locality could be grouped together to determine the Rateable Value. The word 'locality' is so loosely interpreted that properties situate at a distance of nearly two miles are also grouped. The result is that the intended exemption of small properties is not effective and is not available in practice in many cases. We would, therefore, suggest that properties bearing separate numbers must be separately assessed.

MUNICIPAL TAX ON PROPERTY

Question 203.—What principles would you recommend for adoption in regard to the general property tax? Would you exempt rental values below a particular level? How would you deal with the properties of owner-occupiers or of charitable or educational trusts or of co-operative housing societies? What remissions, if any, would you give for vacancies? So far as new buildings are concerned, would you recommend exemption for the first few years after construction, with a view to encouraging house-building?

Exemption.—The recommendations of the Local Finance Enquiry Committee in this connection are as follows:

- (1) "There should be no exemption from the property tax merely on the ground of the annual value falling below a particular monetary limit. Such exemptions, wherever they exist, should be done away with."
- (2) "There is no reason for the continuance of the concession in regard to the levy of property tax in the Municipal Acts of Bengal, Bihar

and Orissa in respect of buildings, the costs of construction of which exceeds one lakh of rupees."

- (3) "In all cases where exemption is granted at the instance of the Government, an equivalent contribution should be paid by that Government to municipal funds."

- (4) "Where an actual service like supply of water is rendered, there should be no exemption."

In our opinion, the first two recommendations are in the nature of a retrograde step. Even at present, at various places, properties of annual rateable value below a particular money limit (ranging from Rs. 6 to 36) are exempt from taxation.

We are, therefore, of the opinion that the present practice of granting exemptions in the case of properties whose annual rateable value falls below a particular limit, is a healthy procedure and provides a welcome relief to the smaller property-owners. In India there are immovable properties which are owned and inhabited by persons whose means are so meagre that they are unable to make two ends meet. They are living below a subsistence level of existence. People in the mofussil areas are generally owner-occupiers. Many of their properties are not buildings but huts of the most primitive type. Again, there are widows, old disabled persons who own small houses in the mofussil. Tax on the properties of such persons would be most inequitable and regressive.

We would, therefore, suggest that the present practice of granting exemption to properties of smaller rateable value should be continued. The exemption limit should be fixed at the money limit of annual rateable value of Rs. 250 or below.

We are also not in favour of the suggestion that the concession in regard to the levy of property tax in the Municipal Acts of Bengal, Bihar and Orissa in respect of buildings, the cost of which exceeds one lakh of rupees, should be discontinued. The Municipal Acts of the above 3 States provide that where the actual cost of buildings exceeds one lakh of rupees, the percentage on the annual value to be levied in respect of so much of the value as is in excess of one lakh of rupees shall not exceed one-fourth of the percentage on rate ordinarily leviable on that class of property. Such a concession, it appears, was specially intended for jute mills and industrial concerns, when they were first started. It was also justified on the ground that Local Government services benefited residents more than industrial concerns. Thirdly, many large industrial holdings have their own sewage system. In England also, such a concession is granted to industries of mining, manufacture and transport but not to commercial properties. Government, however, compensated the local bodies in the case of such big establishments.

The apparent ground on which the majority of the Committee suggested the discontinuance of such a practice of exemption, was their anxiety for financial strengthening of the local bodies. We are, however, of the opinion that such a concession to the commercial and industrial properties should be made available in all the States and a compensatory grants-in-aid may be guaranteed to the local bodies for the losses suffered on this account.

We are opposed to the present practice of exempting Government properties from the local taxes, as it would amount to an unfair discrimination against the private enterprise. We are, therefore, in agreement with the recommendation of the Committee that no Government property should be exempt from local taxation and that in all cases where exemption is granted at the instance of a Government, an equivalent contribution should be paid by that Government to municipal funds.

Besides, there should be concessional tax on all properties which are not used for commercial or ordinary residential purposes. Thus, properties used for religious, educational, cultural and charitable purposes should be charged at the concessional rate.

So far as the properties of owner-occupiers are concerned this should be assessed on the basis of the rents of the properties situate in the neighbourhood.

Remission for Vacancies

The recommendation of the Committee in this respect is as follows: "In view of that fact that the major portion of the services rendered by local bodies such as street repairs, maintenance of roads, fire brigades, public lighting, drainage, street cleansing, etc., has to be performed whether the building remains occupied or not, there seems no justification for giving a greater remission than half of the tax due in all such cases. Remission should not be granted for available vacancy of less than 90 consecutive days in a year. No ratepayers who are in arrears should be entitled to vacancy remission."

In Bombay remission to the extent of $\frac{1}{3}$ of the property tax is granted for the properties remaining vacant for 60 consecutive days or more in a year. We suggest that the same practice should apply to properties in all the States.

Exemptions to the New Buildings

In order to give a fillip to the house building activity, exemption from all property taxes should be granted in the case of new properties for the first two years. New buildings are also exempted for the purposes of income-tax for two years in the beginning. At any rate if it is not found feasible to grant full exemption to the new buildings, at least a concessional rate of property tax should be made applicable to them.

PROGRESSION IN PROPERTY TAX

Question 204.—Should property tax be progressive? If so, how and to what extent?

The Local Finance Enquiry Committee was generally in favour of a progressive scale, adaptable at the discretion of the municipality concerned. They have also recommended, as stated earlier, the repeal of the provision of some of the Municipal Acts which provide that rates for property taxes should be regressive after the valuation reaches the level of rupees one lakh. They are also against the provisions of law existing in some of the States providing for the exemption from local tax, of properties on the ground of extreme poverty of the assesses or on the ground that the valuation is below a particular low minimum.

The cumulative effect of all these recommendations, combined with their suggestion to substantially increase the rates of property taxes almost everywhere, if accepted, would result effectively in obliterating the institution of private property to a great extent. It appears that, the main consideration that has led the committee to go in for progressive property tax, is the checking of the evils arising from unequal distribution of wealth.

We are strongly opposed to the idea of introducing a progressive element in the case of property tax in the local sphere to eliminate the evils resulting from the unequal distribution of wealth. Progression fits in with personal taxes and not impersonal taxes. Attempts to introduce progressive taxes on properties in the local sphere in many countries of the world have not met with success.

The advocates of the progressive property taxes in the local sphere are oblivious of the main principle of the 'ability to pay' which is implied in the system of progressive taxation. The local property tax correlates very badly with 'income' from property, much less with the local valuation of the property. In the case of valuation of properties on rental basis, particularly owner-occupied properties, it cannot be argued that the valuation has any relation to the actual income of the assessee. Again, even in the case of a rated property, the income derived by way of rents is no index of a person's ability to pay. If, for example, a property-owner has mortgaged his property, he will have to pay interest charges on the amount borrowed by him. In that case, if he were assessed on the same basis as others possessing similar properties but with encumbrances, the tax would impose an inequitable burden on him. Further, the whole procedure for the levy of local progressive property taxes, including the fixation of the grades, slabs and brackets is found to be more arbitrary and unscientific at the local level. The recommendations of the majority that progressive property taxes are desirable at the local level is, in our opinion, highly objectionable.

Eminent authorities on Public Finance are almost universally opposed to the adoption of the element of progression in the property taxes at the local level. Some of them have even opposed proportional taxes and have suggested that the regressive taxes on property would be most suitable. A recent authority on Public Finance says that "It is most desirable to have a local tax which does not exaggerate local disparities in wealth. This it will be noted, cuts out for local use progressive income taxes. A tax which is proportional or even moderately regressive is more appropriate for a local purpose than a progressive tax, etc." (Hicks: 'Public Finance'.) "The property taxes actually levied even on proportional basis perpetuate serious direct distributional injustice. Let us not pile errors upon errors and carry this injustice further." (Seligman: 'Essays progressive tax.' (J. R. Hicks, Hicks Lesser: 'The Problem of Valuation for Rating'.)

"The least hampering type of tax is the rather regressive tax to which everyone contributes, the sort of tax which we have considered desirable as a local tax on other grounds. The most hampering variety is the progressive tax." (J. R. Hicks, Hicks Lesser: 'The Problem of Valuation for Rating'.)

Question 205.—*What categories of local bodies should be empowered to levy property tax? What should be the extent of the power in each case, and what conditions, if any, should be attached to the exercise of the power?*

At present all the local bodies are empowered to levy property tax in India. The district local boards are levying the tax in the form of a fund cess while the village panchayats are levying the tax on houses. We are in favour of empowering all categories of local bodies to levy the property tax on the condition that minimum and maximum rates should be statutorily laid down by the Government. Within these limits the local bodies may be allowed to levy property tax. Again, suitable provision should also be made to avoid double taxation by way of taxation by more than one authority on the same property.

Question 206.—*Have you any suggestions to make in regard to the administrative machinery and procedure for the assessment and collection of the property tax in relation to the different categories of local bodies?*

The ideal system of assessment of the properties would be to have one Central Authority for the purposes of valuation of properties within the jurisdiction of all the local bodies. The State Government should establish such a body in the interests of uniformity and should also bear the expenses. Such an independent expert authority for valuation also exists in the western countries. At any rate, the whole system of valuation of properties should be rational, uniform and scientific. In the case of grievances, however, the property-owners should have a right of appeal to the higher authorities.

The administrative machinery and procedure for collection should be such as would cause the least possible harassment to the assessee. It should also be borne in mind at the same time that the expenditure on this account does not go out of all proportion to the revenue derived from it. Thus, the system of collection of local fund cess, with the revenue collections made by the revenue authorities, is most convenient and least expensive. In the panchayat areas, the panchayat authorities themselves would be in the position to arrange for collection of house tax, sanitation tax, etc., as they are best informed with regard to the financial position of the individual assessee. In the municipal areas the present system of allowing the rebate for punctual payment should continue. Interest at the ordinary rates and not at the penal rates should be charged on the arrears of tax. While admitting that the percentage of arrears is very high in India, we are opposed to the idea of vesting the local bodies with coercive powers, as recommended by the Local Finance Enquiry Committee, as such a power is bound to cause undue hardship to the assessee. In the rural areas, generally the collection of taxes of the local boards and panchayats is never punctual on account of the seasonal financial stringency of the agriculturists. In their case, no interest for the arrears should be made chargeable. Further, the local bodies should have the power to proceed against the movable properties, and not against immovable properties, for the recovery of their taxes and fees. No disqualification in the matter of election to the local bodies should be attached for the delay in the payment of the local taxes by any person.

SERVICE TAXES

Question 207.—*In so far as certain taxes usually known as "service taxes"—e.g., water, lighting, drainage and conservancy taxes—are levied along with, and on the same basis as, the general property tax by certain local bodies what suggestions, if any, would you make in regard to the rates of levy, collection, etc., of these taxes? Have you any comments to make regarding property and service taxes vis-à-vis port trust properties, railway properties, other properties of the Central Government and properties of State Governments?*

The present position is that in the majority of the States the service taxes, viz., water lighting, drainage and conservancy taxes are not self-supporting. Water supply is self-supported in all the States except Bihar and Orissa. Street lighting is not self-supporting in most of the States. In the City of Bombay lighting tax is not even permissible. Conservancy and drainage—drainage rate, latrine rate, scavenging tax and general and special sanitary cess in Bombay—are not self-supporting anywhere.

The principle of self-sufficiency in respect of the specific services is not laid down in any of the Municipal Acts, but seems to have been derived from the extension of the language used in those Acts. The relevant section merely says that the rate should be fixed in such a way that the receipts do not exceed the amount required for providing the services. They prohibit the diversion of the proceeds of such taxes to other purposes but do not lay down the converse proposition that the expenditure on such services must be limited

to such receipts and cannot be supplemented from general revenues, in case the yield is insufficient. Further, in some States where there are statutory limits laid down with regard to the rates of such service taxes, the acceptance of the principle of self-sufficiency would involve a drastic curtailment of those essential services. Further, at a time when the central and provincial taxes impose a very heavy burden on the tax-payer, increased taxation by the local bodies to make the services self-sufficient would prove unbearable. We are of the opinion, therefore, that the services need not be self-supporting; if in any year the income derived from the levy of a particular service tax falls short of the expenditure, it should be supplemented from the general revenues of the municipalities or from the increased grants-in-aid from the States. A special service tax may, however, be levied when the areas within the municipal limits are differently developed. They are also justified when an individual rate-payer derives a special benefit from it. But in the case of uniform development of all areas, the consolidated rates are desirable.

The present practice of calculating service taxes on the basis of rateable value of the property has not, in our opinion, been objectionable and therefore should continue. The taxes may be collected with the general tax to facilitate recovery and economy in expenditure. The fixation of maximum and minimum rates for these taxes in all the States would, in our opinion, be highly desirable and will curb to a certain extent the tendency, noticeable in some municipalities, to increase the rates to any extent they like.

Question 208.—*Do you consider that the system of local fund cesses (viz., cesses on land revenue, collected by the revenue administration and handed over to local bodies) is satisfactory in its operation? If not, what alterations, if any, would you suggest? Please deal with local boards and village panchayats separately, and specify the individual State or States to which your reply relates. In particular:*

- (i) *Are minimum and/or maximum rates of levy laid down? Are they, in your opinion, either too high or too low?*
- (ii) *To what extent are the cesses earmarked for different purposes (e.g., road cess, education cess, etc.)? Would you extend or curtail the system of earmarking? Should there be a general cess in addition to earmarked cesses? In what circumstances?*
- (iii) *To what extent do suspensions and remissions of land revenue affect the collection of the cesses? Have you any suggestions to make in this connection?*
- (iv) *Please deal with any special problems connected with local fund cesses in*
 - (a) *Part B and Part C States,*
 - (b) *areas in which zamindaris are newly abolished.*

The main sources of revenue of District Local Boards are the grant-in-aid and the local fund cess. At present in the State of Bombay local fund cess at the compulsory uniform rate of 3 annas per rupee of land revenue is charged and the revenue is exclusively made available to the local boards. No portion from this amount is earmarked for education expenditure. The collection of the local fund cess is the responsibility of the revenue officers in the village. The system, therefore, causes least inconvenience to the tax-payer and is most economical.

The Local Finance Enquiry Committee was of the opinion that the prevailing rate of local fund cess in the State of Bombay was sufficiently high and that, therefore, there was no ground for increase in the cess. We agree with this recommendation. In the case of loss of local fund cess on account of remissions of land revenue, the State should, in our opinion, make good the loss by giving increased grants-in-aid to the local boards. We are also in favour of the suggestion of the committee that the collection charges of the local fund cess being insignificant, the State Government should undertake this work without charging anything to the local boards.

OCTROI AND TERMINAL TAX

Question 209.—*Please state your views on the relative merits of octroi and terminal tax, in one or more of the forms in which they prevail in different parts of the country, from the standpoint of—*

- (i) *the local body concerned: e.g., revenue derived and, in comparison with it, cost of collection, size and complexity of administration, scope for evasion, etc.;*
- (ii) *the person who pays the tax; certainty as to amount payable and convenience of collection; and*
- (iii) *the trade, the consumer, etc., incidence and effects of incidence, in so far as these can be broadly assessed.*

Are octroi and terminal tax mutually exclusive systems, or would it be permissible and desirable, in certain circumstances, to combine the two systems?

On an examination of the relative merits of (a) octroi, (b) terminal tax, and (c) any desirable form of combination of the two, which particular alternative would you recommend for general adoption by local bodies? Do any constitutional or legal difficulties stand in the way of implementing your suggestions?

Octroi or Town duty is the cess levied by local bodies on the import of goods into a local area for consumption use or sale therein. It is levied on articles even of common necessities of life, which are included in the schedules framed for the purpose and permitted by the State Government. On the exportation from a town of dutiable goods the octroi levied on them is refunded. The local bodies have also to provide bonded warehouses for storage of goods in transit, for which a fee is levied.

At present octroi is in vogue only in the four provinces, viz., Bombay, U. P., Punjab and Madhya Pradesh. Octroi is a common source of income for local bodies. The burden, however, falls inequitably both on the poorer sections of the society and on trade and industry. The imposition of octroi creates artificial barriers in the free flow of trade and adds to the cost of production of industrial goods. For instance, the rapid progress of Ahmedabad Cotton Trade and Industry during the last fifteen years is, in some measure, due to the absence of octroi.

Terminal Tax

Terminal Taxes are taxes on goods or passengers carried by railway, sea or air. At present, they are included in the Union List. The proceeds of the tax are, however, assigned to the States under Article 269 of the Constitution. Taxes on goods or passengers carried by road are not covered by this entry. Such taxes will continue to be within the jurisdiction of the States. However, this entry does not debar the levy of tax on pilgrims travelling by road. Article 277 of the Constitution contains a saving Clause that any taxes which were being levied immediately before the commencement of the Constitution, viz., January 26, 1950, by any Municipality, District or other Local Authority, may continue to be so levied notwithstanding the fact that those taxes are mentioned in the Union List, until provision to the contrary is made by Parliament by law. Many municipalities which were previously levying the terminal taxes, are still continuing the levy even now. For an objective assessment of both octroi and terminal tax as forms of taxation, we cannot do better than quote the following remarks of the Taxation Enquiry Committee (1924) :

"In the form in which they (octroi and terminal tax) are levied in India, they offend against all canons of taxation. They are uncertain in their incidence. Their collection and the system of refunds, which form an essential feature of octroi, puts the person paying the tax to a great amount of inconvenience. Where they are imposed on the necessities of life as in India, they do not proportion the burden to the means of the payer and the expense of collection and the facilities for fraud are disproportionately large, with numerous bodies independently taxing trade, it is impossible to know what are the burdens trade is really carrying and quite impossible to ensure their being adjusted in any way fairly among different articles and goods. The popularity of these taxes is due to the fact that their incidence is shifted and that it very difficult to determine on which classes the burden ultimately falls. The collection of terminal tax through the railway agency has removed all the administrative difficulties inherent in a system of octroi and there is a tendency among municipalities to resort to the tax whenever they are in financial difficulties because the local authority can in this case transfer the odium of collection to the Railway Company. The tax is also very defective from the educative point of view, since it does not encourage sense of responsibility among the electors, who do not directly feel the burden of the tax. Sir Josiah Stamp sums up the case as follows :

'In my judgment, both theoretically and on the result of experience, no country can be progressive that relies to any extent upon octroi, which has nearly every vice.'

Of the two taxes, terminal tax possesses some obvious advantages over octroi. Firstly, there is no system of refunds in terminal tax and, therefore, the rates are much lower. The system of refunds in the case of octroi is introduced with a view to relieve it of some of its bad features, but in actual practice, no refund is obtainable until several days after the payment. This practice has in a number of places either created a new class of brokers who obtain refunds of octroi on payment of some brokerage to them or encouraged corrup-

tion among the staff who for a consideration allow the dutiable articles to pass through without any payment of octroi. Secondly, the collection in the case of terminal tax, being both by Railways and the Port Trust Authorities for a small consideration, the terminal tax is not very expensive in collection; collection of octroi, on the other hand, is both inconvenient and expensive.

Terminal tax has, however, its disadvantages too. Absence of provisions for refunds makes the terminal tax a transit duty to the extent to which the burden of the tax falls on non-residents. Besides, it is levied on all commodities, imports, exports and goods liable to the custom duties. To that extent, they are bound to interfere with the tariff policy of the country with all its national and international repercussions.

Both octroi and terminal tax as sources of revenues offend against all canons of taxation. By hampering trade and industry and by creating avoidable harassment, they have, in our opinion, done more harm than good. Despite the fact that they have been condemned by one and all, they still continue today. The diversity in their rates and the schedules in different States and in different municipalities in the same State, has often resulted in the unfair discrimination of trade and industry in different areas. The earlier therefore, they are abolished, the better for the economy of the country as a whole.

Question 210.—Does your examination lead to the conclusion that both octroi and terminal taxes are unsuitable as forms of local taxation and should, therefore, be abolished? If so, what substitutes would you recommend? Do you consider the suggestion that local bodies should be allowed to levy surcharges on sales tax feasible and desirable?

This, however, confronts us with suggesting the alternative sources for revenue which the abolition of the octroi and terminal tax would entail. In view however, of the recent origin and the high incidence of the sales tax levied at present in many States today, we are opposed to the idea of levying a surcharge on sales tax by local bodies. In other words, the overall burden on trade, industry and the consumers imposed by octroi, terminal tax and sales tax needs to be considerably lightened.

Question 211.—If your suggestions involve certain modifications in the prevailing forms of octroi or terminal tax, what are the changes you would recommend?

Question 212.—What rates of levy, exemptions, procedure for collection and for refunds and arrangements, if any, for "bonding" would you suggest?

Question 213.—Should the basis of assessment for octroi be ad valorem or by weight, etc.? How would you provide against procedural delays and difficulties?

We advocate the total abolition of both octroi and terminal tax on the grounds mentioned before. If, however, for some seasons, the total abolition is not found feasible and its existence in some form, for some time at least, is rendered necessary, the following modifications, in our opinion, would to some extent relieve these taxes of some of their worst features :

- (i) There should be in each State a model schedule for octroi. approved by the State Government and departures from this schedule should not be permitted except with the previous approval of Government. In framing the model schedule, the representatives of the commercial community should be consulted. The maximum and/or minimum rates should be laid down. The rates on necessities of life should be kept as low as possible. Rates on other articles should be fixed in such a way that they do not impose any substantial burden on the trade and consumers.
- (ii) All public utility and commercial undertakings of Government should be treated in the same manner as if they were conducted by private enterprise, as otherwise, the local bodies may be deprived of substantial revenue and the private enterprise may be unfairly discriminated. For instance, the annual loss of the Bombay Municipal Corporation on account of exemption to foodgrains imported by the Government of India was, for years, of the order of Rs. 15 lakhs. If, however, exemption is granted to the Government transactions, the Government concerned should make a contribution in lieu of such taxation.
- (iii) We are in favour of a system of octroi at lower rates without refunds as is prevalent in the Punjab. If this is not found feasible a machinery for easy and quick refunds should be devised.

An important point arising out of the definition of octroi may be brought here to the notice of the Commission. Octroi is levied on the import of goods into local area for con-

sumption, use or sale therein. Refunds are allowed when the goods are exported in the same conditions. Instances have been brought to our notice, however, that when commodities like gram, oilseeds, etc., are imported for processing and the processed goods are exported, no refund is allowed on the exports, on the ground that the goods are not exported in the same condition. Such a procedure in our opinion, is bound to create hardships to the processing industries situated in big cities and towns and would add to the cost of production. A more liberal interpretation of octroi would, therefore, eliminate the avoidable hardship. We, therefore, suggest that refunds on goods exported out of the municipal limits after being processed should be allowed.

- (iv) Adequate 'bonding' facilities should be provided by the municipalities for goods in transit. The fees levied for 'bonding' should be low and the same should not be allowed to partake of the nature of additional revenue.
- (v) We are in favour of assessing octroi on the 'maundage' basis rather than on 'ad valorem' basis. All goods should be uniformly charged on 'maundage' basis. The 'ad valorem' basis is rather arbitrary, and has been called as 'one of the worst features of the octroi' by eminent authorities like Prof. Findlay Shiras. Further, ad valorem tax upon necessary goods, produced by agriculture at increasing unit costs, is especially burdensome because the tax grows with the costs and becomes regressive in its effect upon low income groups as cost mounts. Complicated problems arise in determining the value and the scope for corruption becomes greater. Moreover, the prices are trade secrets and their revelation, which is inherent in a system of this nature, is likely to lead to serious abuses. A specific assessment on the 'maundage' basis on the other hand, would much simplify the assessment procedure.

Question 214.—Would an extension of the nationalisation of motor transport make it possible to adopt a simpler and more effective system of terminal taxes on goods transported by road?

The extension of the nationalisation of motor transport would not, in our opinion, bring about any improvement in the present system of terminal taxes on goods transported by road.

Question 215.—Have you any suggestions to make in regard to the better correlation of octroi or terminal tax with allied forms of State and Central taxation such as sales tax, excises and customs?

Commodities liable to customs duty should be exempted from octroi or terminal tax, as otherwise the multiplicity of taxes on any commodities would render its price prohibitive for consumers and would also add substantially to the cost of production. The overall effect of sales tax and excise duty should be examined before any commodity already liable to sales tax and excise duty is included in the octroi schedule. At any rate, the rate of octroi should be as low as possible on commodities which are also liable to sales tax and excise duty.

Question 216.—Taxation on goods carried by road is only one of the items covered by entry No. 56 of the State List, viz., "taxes on goods and passengers carried by road or on inland waterways". Have you any comments or suggestions to make in regard to the utilisation of this entry for purposes of local and/or State taxation?

We have no comments to offer on this.

Question 217.—Should the "Pilgrim Tax" levied by certain local bodies be more widely adopted? Do you consider that a suitable form of taxation on the floating population in the bigger cities can be devised?

'Pilgrim Tax' is a tax levied on the persons temporarily visiting a centre of pilgrimage or a centre where people congregate. A terminal tax on passengers in the form of pilgrim tax is in vogue in almost all the important pilgrim centres in this country. Such taxes are usually levied on railway tickets and are collected by the railways. Such taxes cannot be levied without the sanction of the Central Government, as they are included in the Union List of subjects. While the Government of India have been permitting levy of passengers' tax in pilgrim centres more or less freely, they do not appear to favour its levy in places which are not centres of pilgrimage. The Taxation Enquiry Committee had suggested that "a light terminal tax on passengers may be justified in the case of a large city on the ground that as a centre of trade or amusement or of public offices many non-resident persons come in

and make use of the amenities provided by the local governing body". A vast number of people who daily visit the city from outside the local limits enjoy the civil amenities provided by the municipalities but escape local taxation altogether. The general opinion seems to be in favour of taxing such floating population for the benefit of local bodies.

We have no particular objection to the levy of "pilgrim tax" on the above categories of floating population, provided the levy is reasonably small and the minimum necessary, approximating the expenditure in providing the additional facilities, and no undue hardship and inconvenience is caused to the passengers.

Question 218.—What are your views regarding the desirability and feasibility of a "poll tax" as a form of local and/or State taxation?

'Poll tax' in our opinion is not a practical proposition, as such a direct levy is bound to meet with a very strong opposition from the people. Besides, it is doubtful if the State Governments or Local Bodies would themselves accept 'poll tax' as an advisable form of taxation. They would prefer taxes which are less objectionable and which do not stir up popular opposition.

Question 219.—(a) Have you any suggestions, not already covered by your previous answers (e.g., on motor vehicles taxation), to make regarding the levy of taxes on vehicles, animals and boats for purposes of local and/or State taxation?

(b) Do you consider tolls a suitable form of local and/or State taxation? In what circumstances?

Regarding (a), we have no more comments to make on this than those contained in our previous answers on motor vehicles taxation.

Regarding (b), tolls are a survival of the old and vexatious form of taxes. They have outlived their utility, both on account of the hardships they involve on the vehicle owners and the heavy cost of collection and cumbersome method of collection. We, therefore, suggest that tolls wherever they are levied today should be abolished and a compensatory allowance may be given to local bodies from the receipts of the petrol tax.

Question 220.—The Local Finance Enquiry Committee recommends that the limit of Rs. 250 placed on profession tax by the Constitution should be raised to Rs. 1,000. Do you agree? Would you recommend the wider adoption of profession tax by local bodies and/or State Governments? Which categories of local bodies may suitably levy it, and with what safeguards? Should the levy be compulsory in certain cases, and if so at what minimum level? What modifications, if any, would you suggest in the prevailing forms of levy of this tax? What steps would you take for its better correlation with income-tax, from the point of view of incidence or for purposes of administration, etc.?

A tax on professions and trades has been familiar in India from very early times. In view of the fact that it encroaches on income-tax, constitutional limitations have been placed on the amount of tax which can be levied by a local body. Before the Government of India Act of 1935 came into force, however, there was no constitutional limit on the amount of the tax. Even the Government of India Act, 1935, at first did not provide for any limit on the amount. When, however, attempts were made by one province to levy such a tax on a graded basis of income, the Central Government became apprehensive of the conflict between such a tax and income-tax. Consequently, the Act of 1935 was amended and a maximum limit of Rs. 50 was fixed. This was raised to Rs. 250 by the new Constitution. Few municipalities which were exempted in this regard by the Act of 1935 were allowed to enjoy the exemption by the new Constitution also. So far as Bombay is concerned, no local body levies profession tax as such but some of them levy small taxes in the form of licence fees on specified trades and callings which are subject to municipal control. This tax is also levied by four or five District Boards. The income from this source is negligible. The Government of Bombay are of the opinion that profession tax can never be a source of much income owing to the disproportionately large collection charges.

In our opinion, the present maximum limit of Rs. 250 for profession tax is a fairly high limit and any further increase in it will lead to grave abuses by the local authorities. Whenever they are faced with financial dilemma, they will find profession tax a convenient source to fall back upon. In actual practice, many local bodies will, therefore, render this 'ceiling' limit to a 'floor' limit. Because, profession tax encroaches on the income-tax, it is desirable that the limit should be kept as low as possible. We are, therefore, not in agreement with the recommendation of the Local Finance Enquiry Committee that the limit of Rs. 250

placed on profession tax by the Constitution should be raised to Rs. 1,000.

Question 223.—*Have you any comments or suggestions to make on any items of local taxation not covered by the foregoing questions?*

Licence fees are another source of considerable income to all categories of local bodies in every State. These fees are levied in order to recover the cost of supervision and regulation of certain trades and callings and for granting certain privileges which impose a special burden on the municipal services. In the City of Bombay, licence fee is charged to a variety of trades and callings such as factories, hotels, slaughter houses,

markets, advertisements, hawkers, surveyors, plumbers and various others. The other municipalities and district boards have, however, a limited field for charging licence fees.

A licence fee, by its very nature, is different from a tax. A licence fee is levied for regulatory purposes and for recouping municipal expenses incurred on such regulation. The Courts would be entitled to interfere in the case of licence fees if they are harsh or unreasonable. The plea of unreasonableness would, however, be barred in the case of taxes. The rate of fees should, therefore, be strictly correlated to the overall expenditure incurred in regulation and supervision and should never be allowed to grow into a convenient source of additional revenue.

सत्यमेव जयते

MADRAS CHAMBER OF COMMERCE, MADRAS

(REPLIES TO THE QUESTIONNAIRE OF THE TAXATION ENQUIRY COMMISSION.)

PART I.—THE TAX SYSTEM

GENERAL

The questions raised are so comprehensive that it is not possible adequately to reply within the time limit given. This Chamber proposes, therefore, to confine itself to general observations.

It is considered that, in general, both direct and indirect taxation should be for one purpose only, namely, the raising of sufficient funds to balance the revenue portion of the budget. Capital requirements should be obtained either by borrowing, particularly in those instances when the purpose is for expenditure on capital account for remunerative enterprises, and by the imposition of Estate duty, where it is logical to utilise this tax on capital for capital expenditure only.

In assessing the income requirements, there should be provision for a slow but gradual increase in the standard of living. With this policy in view and having ascertained the annual requirements on revenue account, the Government should first determine the amount to be raised by direct taxation.

In assessing this, it is strongly recommended that the only realistic policy is that direct taxation should be based on the ability to pay with the main emphasis on the all important factor of encouragement of incentives to work, to save and to invest.

In the opinion of this Chamber direct taxation should not in ordinary circumstances, be considered for the purpose of reducing inequalities of income and wealth and the countering of inflationary and deflationary tendencies or the maintenance of the external balance of the economy.

The high rates of direct taxation on individuals since the war have greatly obstructed the saving or investment by the wealthier and middle classes and have practically removed all incentive to work after a certain level of income has been reached. This policy cannot but be harmful in a country where the future policy has been based on industrial development and increased production. It must be remembered that high taxation has been accompanied by a greatly increased cost of living and there can be but few middle class families who do not find it difficult to balance their own family budget.

In recent years it is apparent that tax evasion has very considerably increased and this must largely be due to the burden of tax now imposed both on the individual and industry. In spite of all that is said to the contrary, this Chamber prefers to believe that the majority of tax payers are honest, or would prefer to be honest, and this Chamber would not be surprised if in the event of a maximum rate of tax of, say 8 to 10 annas, being fixed for the higher ranges of income, tax evasion would decline and there might well be a considerable gain in tax collections.

Direct taxation on industry as distinct from individuals should follow the same principles and should permit of reasonable amounts being placed to reserves in order to finance the present day costs of replacement and sufficient to allow for future expansion. This Chamber is of the view that greater incentives should be given to industry for these purposes and recommends an increased rebate on the standard rate for all amounts not distributed by way of dividends.

Having based the direct taxation on the policy outlined above the balance required must be recovered by indirect taxation. In determining the scope and extent of indirect taxation, care must be exercised in seeing that it is so assessed as to enable Indian industries to compete with the products of other countries. It is essential for this country to export to the fullest extent possible and the price must be competitive.

State Controlled undertakings

This Chamber sees no reason why State owned Undertakings should not be conducted on lines similar to ordinary commercial enterprises. The price of their products should not be influenced by the requirements of the Government or State but it should be governed by the principles adopted by private enterprise namely :—

1. a reasonable return on capital invested
2. similar rates or taxation on profits should be imposed and
3. there should be a reasonable margin for transfer to reserves to cover replacement and expansion.

PART II.—DIRECT TAXES

INCOME-TAX

Residence

Question 46.—Do the provisions of the Income-tax Act (Sections 4A and 4B) regarding the determination of residence of various assessee, viz., individual, Hindu undivided family, firm, association of persons and company, require any modification? In particular, what is your view regarding the retention of the category described as "not ordinarily resident"?

Individuals.—This Chamber considers that no change is necessary except that in Section 4A(a) (iv), after the words "Income-tax Officer", there should be inserted the words "on application made by the assessee".

The following further Clause should be added :—

"Such satisfaction shall be communicated to the assessee within one month of application."

Hindu Undivided Family.—It is considered that the present Sub-section 4A(b) should be cancelled. Hindu Undivided Families, firms and associations should only be regarded as resident if the major part of the control is actually exercised in India.

Companies.—It is considered that Sub-Section 4A(c) should be amended so as to provide that the determination of the residence of a Company shall be based solely on where the control is exercised and Sub-Clause (b) to this Sub-Section, concerning the amount of income arising in India exceeding that arising out of India, should be deleted.

Not Ordinarily Resident.—It is recommended that the category of "Not ordinarily resident" shall be deleted and that it shall be provided that earned income actually earned outside India shall not be taxable in the hands of a person resident in India unless it is actually remitted to India.

Question 47.—Does the definition of "income" (Section 2(6C) require any modification?

It is considered that the definition of "income" in Section 2(6C) is satisfactory except that Section 2(6A) require amending *vide* the reply to Question 50 below.

The Second Proviso to Section 10(2) (vii), in so far as it seeks to levy a charge on profits made on the realisation of fixed assets after the cessation of a business, should be deleted unless it can be shown that the closing down of the business has not been *bona fide* but has been done with the intention to avoid payment of tax which would otherwise have been payable under the provisions of Section 10(2)(vii) if the business had continued.

Question 48.—Are there any receipts or gains which are not taxed at present but which, in your opinion, should be taxed and vice versa? In particular, what is your view regarding the taxing of capital gains?

(a) It is considered that lease premiums and paguee payments should be taxed in the hands of the recipient.

(b) It is considered that unpaid balances over six years old, when taken to credit in the accounts of a business concern, should be taxed.

(c) It is considered that gratuities paid by an employer arising from the death of an employee or his medical unfitness or retrenchment, due to no fault of his own, should not be taxed in the hands of the recipient.

As to the taxing of capital gains, Income Tax, by its very description, is a tax on income and therefore no attempt to tax capital should be made by introducing any provisions into the Income-Tax Act.

If the taxation of capital is ever necessary it should be effected by means of a separate Act specifically directed to that purpose.

Question 49.—Have you any comments on the present position regarding taxation of profits, which accrue or arise abroad, on their repatriation to India?

It is considered that the present concession concerning repatriation of funds from overseas should be extended to profits made in and still not remitted from the former native States of India, so as to encourage the bringing back of such funds into productive use.

Question 50.—What change, if any, is called for in the definition of "dividend" (Section 2(6A)); e.g., in relation to "bonus shares"?

It is considered that there is no necessity to amend Section 2(6A) in so far as that section concerns bonus shares because it has been clearly established by Case

Law that the capitalisation of reserves by the issue of bonus shares does not attract liability to tax in the hands of the shareholder.

In regard to Sub-Section (c) of Section 2(6A), this Chamber is of the opinion that the following further proviso should be added, so as to exclude public companies from the operation of the Sub-Section :

"Provided further that this Sub-Section shall not apply to a public company whose shares are quoted on a recognised Stock Exchange."

Question 51.—Do the provisions of the Income-tax Act relating to the taxability of non-residents through their business connections in India in respect of income deemed to accrue or arise within the taxable territories (section 42 and 43 of the Income-tax Act) affect adversely the interests of persons engaged in foreign trade? If so, what modification would you suggest in these sections?

Sections 41 and 42 of the Income Tax Act have always been regarded as amongst the most controversial provisions of the Act because they seek to assess the profit of a non-resident arising from a business connection in India. Levy of tax on the profit attributable to purchase of goods and materials is peculiar to India and it is understood that there are no parallel provisions in the Income Tax Laws of any other country.

"Business connection" is an abstract idea which is rarely understood by the assessee or by the Income-Tax Officer and assessments are invariably arbitrary. It is suggested that levy of tax should be based on the exercise of a trade in India and not on the existence of a business connection. This Chamber therefore suggests that the words "through or from any business connection in the taxable territories" be deleted from Section 42(1) of the Income-tax Act. Consequentially the words "or having any business connection with such person or" should be deleted from Section 43 and appropriate changes made in the provisos.

Further difficulties which have been encountered in connection with the application of the present Section 42(1) are :

- (a) the difficulty of ascertaining who should be treated as the agent where the non-resident has business connection in various States of India
- (b) the difficulty of realising the tax levied on an agent in respect of transactions carried out with ether agents in the country
- (c) the inequitable result of treating the agent as the assessee for all purposes of the Act and making him responsible for payment of tax due by the non-resident irrespective of whether the agent has or has not sufficient funds of the non-resident in his hands.

Question 52.—What modification would you suggest in the definition of "agricultural income" Section 2(1) to avoid the contingency of the same income being taxed by the Central Government as well as the State Government, e.g., in respect of income from forests, dividends from agricultural companies, etc.?

This Chamber recommends that the taxation of agricultural income be made a Central Government subject.

Question 53.—Are you in favour of integrating agricultural income with non-agricultural income for rate purposes? If so, which of the following methods would you advocate :

- (i) Aggregation of agricultural and non-agricultural incomes only under the State Acts ;
- (ii) Aggregation of agricultural and non-agricultural incomes only under the Central Act ;
- (iii) Aggregation of agricultural and non-agricultural incomes both under the State and the Central Acts ?

Please discuss the administrative, constitutional and other problems that are likely to arise if any of the above alternatives is adopted.

If the recommendation given in the reply to Question 52 is adopted then this Chamber considers that agricultural income should be aggregated with non-agricultural income only under a Central Act.

Question 54.—Would you recommend the abolition, by a suitable amendment of the Constitution, of the distinction between agricultural and non-agricultural incomes and the taxation of both types of income, aggregately under a Central Act?

Yes.

Question 55.—Is the treatment given to irregular and fluctuating income in the present law satisfactory? In particular, should any changes be introduced—

- (i) to average income over a number of years where receipts are irregular and fluctuating ;
- (ii) to spread lump sum receipts over a number of years ?

It is considered that the existing treatment of irregular and fluctuating income in the present state of the Law is not satisfactory because of the high incidence of Super Tax in peak years in the case of such persons as authors, playwrights, professional men whose accounts are maintained on a cash basis, stock brokers, agriculturists, etc. and recommended (i) that where receipts are irregular and fluctuating, the income should be averaged over a number of years (ii) Lump sum receipts should not be regarded as taxable income but if there are any cases where they can properly be so treated, they should be spread over the number of years to which the receipt relates.

Exemptions

Question 56.—Do you think the present provisions regarding exemption of charitable and religious trusts need any modification? If so, in what respects?

It is considered that the present provisions regarding exemption of charitable and religious trusts are adequate.

Question 57.—(i) Should the business profits of co-operative enterprises, which are now exempt, be charged to income-tax and super-tax? If so, should co-operative societies be treated as companies or should a lighter levy be imposed? In case the exemption is continued, should it be restricted to certain categories of co-operative enterprises?

(ii) Do you agree with the view that the income derived by co-operative housing societies by way of rent should not be treated as income from property assessable to income-tax? Would you, in this respect, differentiate between tenant co-partnership housing societies and other types of housing societies?

(iii) It has been suggested that there are divergent decisions by different Income-tax authorities in respect of assessment of income of co-operative societies from sources other than business. If this is so, please indicate such decisions and the measures you would suggest to secure uniformity in assessment.

(i) It is considered that undistributed profits of co-operative enterprises should be taxed in the same way as those of any ordinary association. In this connection no attempt should be made to apply provisions of Section 23A to Co-operative enterprises.

(ii) No comment.

(iii) No comment.

Question 58.—Are you in favour of continuing the concessions given to new industrial undertakings under section 15C of the Income-tax Act? Have initial and extra depreciation allowances made the concessions practically infructuous? If so, what are the directions in which the provisions of this section should be modified?

It is considered that the concessions given under the provisions of Section 15C are so hedged in with restrictions that no hardship would be caused by the withdrawal of the Section, particularly having regard to the present rates of initial and extra allowances for depreciation.

Question 59.—A suggestion has been made that banking profits of foreign branches of Indian banks should be given concessional treatment for tax purposes in order to encourage the opening of branches abroad. What are your views?

To encourage the opening of foreign Branches by Indian banks, it is recommended that profits earned abroad by such Branches should not suffer Income-Tax at higher rate than they would if the profits had arisen in India and consequently if the rate payable in the foreign country in which the profits are earned exceeds the Indian rate, the difference should be adjusted against the tax payable on the income earned in India.

Question 60.—Should any liberalisation be made in the present limits of exemption from tax of life insurance premia and contributions to provident funds?

It is considered that liberalisation of the present limits of exemption from tax of life insurance premia and contributions to Provident Funds is most necessary and very much overdue because the present exemption limit was fixed many years ago and is now completely out of relation to the present economic conditions. Whilst the basis of exemption of one-sixth of the total income is considered fair, it is recommended that the present limit of Rs. 6,000 for an individual and Rs. 12,000 for a Hindu Undivided Family shall be doubled.

Allowances

Question 61.—(i) Do you favour the grant of larger depreciation allowances to assist industry to finance the considerably increased costs of replacement of

assets? If so, how and in what form should they be given—

- (a) by larger depreciation allowances on new assets;
- (b) by revalorisation of existing assets;
- (c) by treating the excess of replacement cost over original cost as revenue expenditure;
- (d) by any other method?

(ii) What is the justification for assistance from public resources to certain classes of taxpayers only by way of covering partially the excess of replacement cost over original cost of old assets?

(iii) In case adequate justification exists for assistance by Government in the form of tax concessions to meet the situation, what safeguards should be prescribed to see that the funds so made available are utilised for the purposes for which they are intended?

i) The problem of finding additional funds with which to finance the extra cost of replacement of fixed assets which has resulted from the inflation in monetary values caused by the Second World War applies in the case of the replacement of fixed assets which were originally installed before 1st September 1939.

In respect of fixed assets which have been installed on or after 1st April 1948, the various special rates of depreciation which are now allowed for Income Tax purposes are adequate and, on the assumption that they will be continued, at any rate for some years to come, it can be said broadly that the full value of a post-war installed fixed asset will have been depreciated for income-tax purposes within its working life and thus, in respect of such post-war installed fixed assets, funds, if permitted, for income-tax purposes, to be retained for the business with which to effect their replacement at the end of their working life.

These special rates of depreciation allowances do not unfortunately, apply to fixed assets which have been installed prior to the War and it is in respect of those assets that the cost of replacement presents so much difficulty to business in finding the necessary funds to meet the very heavy extra cost of something like three times their original cost. In the view of this Chamber, one of the methods suggested under (a), (b) or (c) of paragraph (i) will meet the case of dealing with the replacement cost of pre-war installed assets and it is considered that the problem can only be dealt with by allowing special rates of depreciation for the next few years on assets which were installed prior to 1st September 1939 and which are still in use or alternatively businesses should be permitted to build up over the next few years a special replacement reserve equal, at least, to twice the original cost of such assets.

(ii) If something on the lines of the recommendation set out above could be accepted, the suggested assistance would be applicable to all classes of taxpayers whose businesses are employing fixed assets installed prior to the War and the objection that the additional allowance would only be applicable to certain classes of taxpayers would, it is considered, not be valid because those taxpayers who have set up business since the War are entitled to the extra depreciation allowance applicable to post-war acquired fixed assets.

(iii) If the suggested special reserve for replacement of pre-war acquired fixed assets is acceptable, it is considered that safeguards are necessary to ensure that the reserve is used for the purpose for which it is intended and should a worn out pre-war acquired fixed asset not be replaced within three years, the amount of the special reserves already allowed as an expense for income-tax purposes should then be disallowed and added to the taxable income.

Question 62.—Are any changes called for in the classification of assets for purposes of depreciation, rates of depreciation and methods of computing the allowances?

The present classification of assets for the purposes of depreciation is not unreasonable and whilst we disagree with the basis of calculation of the allowances, in the answer to the preceding question, the rates themselves in relation to the present basis, are not unreasonable except that it is considered that many of the smaller assets, e.g., furniture, tools in use, electrical fittings, bicycles, books, etc., should be treated on the basis of replacement and not of writing them off by means of a depreciation allowance.

Question 63.—Should any tax concessions be given to encourage development of mineral resources? If so, what form should they take? In particular, should depletion allowance on wasting assets be allowed? How should it be computed for different kinds of assets you have in view?

It is considered that mining concerns should be treated for taxation as they are in South Africa where development expenditure, whether on capital account or otherwise, is allowed as a charge before arriving at profits assessable to tax.

Question 64.—In what form would you provide for personal and family allowances—

- (i) exempting the first slice of income from tax; or
- (ii) providing specific allowances for family and dependents?

In the case of (i), do you consider that the first slice—Rs. 1-1,500—should be revised? In the case of (ii), what treatment would you give to the Hindu undivided family?

It is recommended that the first slice of income up to a reasonable limit should be completely exempt, such slice being double that of an individual for a Hindu Undivided Family.

In addition, there should be reasonable allowances in respect of married persons and children.

Question 65.—Should the present law regarding admissible expenses (section 10(2)) be altered? If so, please indicate, with reasons, the items of expenses (i) which are not now admissible but, in your view, should be admissible and (ii) which are now admissible but, in your view, should not be admissible.

It is recommended that the words inserted into Section 10(2) (xv) by the Income-tax (Amendment) Act, 1952, "not being an allowance of the nature described in any of the Clauses (i) to (xiv) inclusive and" be deleted.

It is further recommended that the transfer of the employers' contribution and interest thereon in an unrecognised Provident Fund to the new Government Provident Fund Scheme should be allowed as a business expense.

Rate of Structure

Question 66.—(a) Are you in favour of combining income-tax and super-tax into a consolidated levy?

(b) What are the merits or demerits of such a step from the point of view of (i) assesses (ii) administration?

(c) Are you satisfied with the degree of progression in the present rate structure (both income-tax and super-tax) especially in regard to its economic effects?

(d) In case you consider a change is necessary, what alternative rate structure would you recommend?

(e) Should the rate of surcharge levied under Article 271 of the Constitution also be graduated?

(a) It is considered that Income-tax and Super-tax should be combined into a consolidated levy.

(b) Provided the consolidated tax is properly graduated there should be no demerits from the point of view of the assessee and the present anomaly whereby no relief is obtainable by an assessee for Super-Tax (Corporation Tax) already paid by a Company in respect of income derived therefrom, whereas relief is granted for Income-Tax paid by a Company, will disappear.

No administrative disadvantages are apparent and it is considered that in fact a consolidated levy will simplify procedure because only one computation of the tax payable will be necessary.

(c) It is considered that the present rate structure of both Income-tax and Super-tax is too severe in its effect on the middle income levels.

(d) The following rate structure is recommended:—

Suggested Rates of Income-tax

Individuals, Associations of Persons & Unregistered Firms:

On the first	Rs. 4,200/-	Nil
On the next	Rs. 5,800/-	1 anna
"	Rs. 5,000/-	2 annas
"	Rs. 5,000/-	3 annas
"	Rs. 5,000/-	4 annas
"	Rs. 5,000/-	5 annas
"	Rs. 10,000/-	6 annas
"	Rs. 15,000/-	6 annas 6 pies
"	Rs. 15,000/-	7 annas
"	Rs. 30,000/-	8 annas
"	Rs. 1,00,000/-	9 annas
"	Rs. 1,00,000/-	10 annas 6 pies
Balance		12 annas

Hindu Undivided Family:

First Rs. 10,000/- nil and thereafter as for Individuals.

Companies:

7 annas in the rupee, with a rebate of 3 annas on undistributed profits ploughed back.

(e) It is considered that the principle of allowing for the receipt of a Surcharge in the annual budget is wrong and the powers given under Article 271 of the Constitution for imposing a Surcharge should only be used in instances of grave national emergency.

Question 67.—Have you any change to suggest in the exemption limit for individuals (Rs. 4,200) and for Hindu undivided families (Rs. 8,400)?

It is considered that present exemption limits are reasonable provided that the exemption is made applicable to all tax-payers, *vide* our answer to Question 64.

Differentiation.

Question 68.—(a) Are you in favour of a distinction being made between earned and unearned incomes? What is the economic justification for such a distinction?

(b) Is the present definition of "earned income" in section 2(6AA) of the Income-tax Act adequate in this respect or would you suggest any modification?

(c) Should the quantum of relief now afforded be extended or reduced? If so, to what extent?

(a) It is considered that the distinction between earned and unearned incomes is only necessary for the purpose of granting an earned income allowance and, provided the principle of a single graduated tax is accepted and allowances for married persons and children, *vide* our reply to Question 64, are introduced, the present level of earned income allowance is considered adequate.

(b) It is considered that the present definition of "earned income" in Section 2(6AA) is adequate.

(c) See answer to (a) above.

Miscellaneous.

Question 69.—Have you any changes to suggest regarding the principles followed in valuing stocks of a business for assessment purposes?

The principle which should be followed in the valuation of stocks, is that universally recognised of cost or market value, whichever is the lower, provided it is clearly understood that market value must take into account any reduction in value which has occurred subsequent to the close of the financial year up to the date when the accounts are finally closed.

Question 70.—Do you consider that any change is called for in the method of assessment of the Hindu undivided family? If so, in what respects?

No comment.

Question 71.—Should exemption from income-tax be allowed in respect of voluntary surrender by managing agents of the whole or a part of managing agency commission? What safeguards should be laid down against misuse of such a provision?

It is considered that exemption from Income-Tax should be allowed in respect of voluntary surrender by Managing Agents of the whole or a part of their Managing Agency Commission unless it can be shown that the surrender has been made *vide* with the intention of evading payment of tax.

Question 72.—On what basis would you suggest that double income-tax avoidance agreements should be concluded between India and other countries?

It is considered that the only tax which should be payable is that of the country in which the income arises and in no circumstances should income be subjected to double tax.

Question 73.—Is the present law relating to determination of "bona fide annual value" of property and deductions allowed from it satisfactory? If not, please give any alternative proposals you have in this respect.

It is considered that the present provisions of Section 9 of the Income-tax Act are adequate.

Question 74.—Is any change required in respect of provisions relating to carry-forward of losses? Are you in favour of allowing losses to be carried backward in case of cessation of business?

It is considered that losses should be carried forward without any time limit in the same way as unabsorbed depreciation.

On discontinuance it should be provided that the last three years of assessment may be adjusted, at the option of the assessee, to the actual results of each of those three years and any tax found as the result, to have been over-paid, should be refunded.

Question 75.—Do the provisions relating to the payment of advance tax under section 18A of the Income-Tax Act need any modification?

It is considered that no revision is necessary to the existing provisions of Section 18A.

Question 76.—Do the principles underlying the assessment under section 34 of the Income-tax Act need any modification?

Section 34 of the Income-Tax Act in its present form was the result of the amendment made in 1948 to the original section when it was considered necessary to provide Income-Tax Officers with wide and sweeping powers to tackle cases of tax evasion. The limit of eight years introduced in the section was mainly in-

tended to cover all cases to be investigated by the Income Tax Investigation Commission, so that there could be no loss of revenue by assessee's pleading limitation. Now that the Income Tax Investigation Commission has nearly completed its labours and evaded incomes have been brought to light presumably to the fullest extent possible, it is no longer considered necessary to retain the present Section 34 in the Act.

It is therefore suggested that a return should be made to the old Section 34 i.e., before its amendment in 1948, the language of which section was quite fair to both the assessee's and the Income Tax Officer's point of view. Under the present Section 34, it is impossible for an assessee to be certain of his Income Tax liability until eight years have expired after the particular year of assessment.

Question 77.—What measures would you suggest for simplifying the procedure of assessment in order to reduce the cost of compliance with the regulations?

It is considered that Income Tax Officers should place more reliance than they appear to do so on present on audited accounts and computations prepared by qualified representatives of assessee's. They should devote less time to detailed checking of returns submitted on behalf of assessee's by qualified representatives which will allow greater care to be paid to matters of principle and to returns of assessee's not prepared by qualified persons.

Question 78.—It has been suggested that the Appellate Tribunal should have powers to enhance assessments in the same manner as Appellate Assistant Commissioners have. What is your opinion?

It is considered that the Appellate Tribunal should continue to be a judicial body without powers of enhancement.

Taxation of Companies and Shareholders.

Question 79.—Do you recommend that an element of progression should be introduced in the corporate tax?

Please see answer to Question 66 wherein it will be noted that it is recommended that the tax applicable to all Companies should be at the flat rate of seven annas in the rupee with a rebate of three annas on as much of the profit as is undistributed and ploughed back.

Question 80.—Would you advocate different rates for different types of corporate enterprises, e.g.,

(i) small industries;

(ii) cottage industries;

(iii) private limited companies or what may be termed proprietary companies;

(iv) holding companies?

It is considered that where concessions are necessary in order to assist (i) Small Industries, Cottage Industries, these should be made in the form of suitable subsidies. Differentiation in rates of Income Tax applicable to such concerns is not considered a suitable method of affording them financial assistance.

In regard to (iii) Private Limited Companies and (iv) Holding Companies, if our recommendation for a flat rate of tax to be applicable to all Companies is adopted, such Companies will not require any further relief because any income received by them in the form of dividends from shares in other Companies will automatically qualify for relief on account of tax paid by the Companies from which the dividends are derived and will not be subject to tax a second time.

Question 81.—There is a demand for the exemption of inter-corporate dividends from corporation tax. Do you consider this justified, and if so, why?

It is considered that the demand for the exemption from Corporation Tax of inter-corporate dividends is fully justified because the present system results in the same income being taxed twice over. As explained in the answer to the preceding question, a single rate of tax applicable to all Companies will meet the case.

Question 82.—Do you think that any special provisions are necessary for the assessment of—

(a) banks; and

(b) investment companies?

Do existing rules relating to assessment of insurance companies, especially mutual insurance associations, require any change? If so, in what respect?

(a) It is not considered that any special provisions are necessary for the assessment of Banks, subject to our answer to Question 59 above concerning foreign Branches of Banks.

(b) Provided the present Super Tax (Corporate Tax) applicable to companies is abolished and Company profits are subject to a single flat rate of tax, no special provisions are considered necessary for the assessment of investment Companies.

As regards Insurance Companies, we have no information on which to base any comment.

Question 83.—Do you think that differentiation should be made between distributed and undistributed profits of companies for tax purposes? If so, on what grounds? What change would you suggest in the present quantum of differentiation in favour of undistributed profits? Should the concession in future be restricted to particular industries?

the tax concession in favour of undistributed profits is allowed to continue as at present or in a modified form, what measures would you suggest to ensure:

(a) that retained profits are not used as a device by share-holders of private limited companies to evade super-tax;

(b) that retained profits are actually applied for productive purposes?

particular, are the provisions of Section 23A of the Income-tax Act satisfactory? If not, what changes would you suggest?

In this Chamber's remarks on paragraph 61, the necessity for increasing the rebate of tax on undistributed profits in order to provide for replacement of sets has been stressed and in the suggested rate of 3 annas applicable to Companies, shown in our comments paragraph 66(d), a rebate on undistributed profits 3 annas in the rupee has been suggested.

It is considered that the foregoing comments apply usually to private manufacturing and trading Companies to public Companies and it is the opinion of this Chamber that such private Companies should be excluded from the operation of Section 23A.

This would thus leave Section 23A applicable only to the private investment Company and in respect of such Companies it is considered that no rebate should apply to that part of their profits which are retained in the business.

It is further considered that the present percentages to which profits may be retained are reasonable and do not require amendment provided that the Section is so amended as to allow the Income Tax Officer discretion to take other factors into account besides those presently permitted which are limited to the smallness of profits made and any past losses. Such other factors could include the cash position of the company and any losses incurred subsequent to the accounting period under assessment.

Question 84.—Do you think, in view of the fact that profits distributed by a company are subjected to corporation tax, it is appropriate that they should also be charged to super-tax in the hands of share-holders? If not, what are your suggestions in this regard?

We have recommended (a) a single consolidated levy of tax and (b) a flat rate of tax applicable to the profits of all Companies. If these recommendations are accepted it follows that income derived from a company, which will have already suffered tax at the Company rate, will either have to be subjected to additional tax in the hands of the shareholder, representing the difference between the Company rate of tax and the rate applicable to that slab of the shareholder's income into which the dividend falls or, conversely, the shareholder will be entitled to a refund of the difference between the Company rate of tax and the rate of tax applicable to him, should his income be below the slab at which the rate of tax payable will correspond with the rate applicable to Companies.

Question 85.—Would you consider that industrial, commercial and similar other enterprises undertaken by the Centre, the States and Local Bodies should be required to contribute, from their earnings in the way of income-tax or in other ways, to general revenues?

It is considered that industrial, commercial and similar other enterprises undertaken by the Centre, the States and Local Bodies should pay Income Tax in exactly the same way as is paid by ordinary industrial concerns. If the profits of State enterprises are not subject to the same taxes as those of private concerns, the latter are put to a grave disadvantage and, secondly, unless the profits of State-owned concerns are subject to the same taxes, it is very difficult to measure their standard of efficiency compared with that of private industry.

Evasion and Avoidance of Tax

Question 86.—What measures would you suggest for the greater use of the services of Chartered Accountants for assisting in the determination of the taxable income of assessee? What obligations should be placed on a Chartered Accountant when he certifies a statement of accounts of an assessee for purposes of income-tax assessment? In particular, with a view to minimising evasion of tax, would you recommend that the certificate of a Chartered

Accountant should invariably accompany the return for business income over a certain limit? If so, would you suggest that a form of certificate should be prescribed indicating the scope of the check that should be exercised by Chartered Accountants who render the certificate mentioned above. Do you agree that fees payable by assessee to Chartered Accountants for such certificates should be restricted to a schedule to be prescribed by Government?

The Institute of Chartered Accountants in India is a recognised professional body with adequate powers of control over its members so as to ensure a proper standard of integrity. Therefore it is considered that accounts and computations of assessee prepared by members of that Institute should be accepted as far as possible with the minimum of detailed enquiry.

It is considered that assessee ought not to be compelled to utilise the services of a Chartered Accountant and the Income-tax Officer should limit himself to advising an assessee to doing so. No standard form of certificate is considered practicable or desirable and it must be left to individual members of the profession to decide on the form of certificate which is properly applicable in each case. Similarly, no standard scale of fees is considered practicable or desirable.

Question 87.—What changes would you suggest in the present law relating to the representation of assessee before Income-tax authorities (section 61) in order to ensure—

(i) effective representation of assessee at reasonable fees;

(ii) a minimum level of proficiency on the part of representatives regarding the subject of income-tax law, rules and regulations?

It is considered that no change in the present Section 61 of the Act is necessary.

Question 88.—Will it assist in checking evasion if the names of the persons who are penalised for concealment of income are published?

It is considered that the names of persons penalised for concealment of income should only be published where criminal proceedings are taken and the persons concerned are found guilty.

Question 89.—Do you think that the present practice of excluding, from taxable profits, perquisites given to employees of business undertakings results in considerable loss of revenue? If so, please state the perquisites you have in mind, and how they should be dealt with for the purposes of taxation.

It is considered that the exclusion from taxable profits of perquisites given to employees of business undertakings does not result in any considerable loss of revenue and it will no doubt be appreciated that by far the greatest proportion of such perquisites are in fact expenses properly and necessarily incurred for the purpose of the business.

In this connection attention is drawn to paragraphs 140 and 188 of the report of the Income Tax Investigation Commission, 1949.

Question 90.—In the case of a company under liquidation, what steps, if any, would you suggest for safeguarding payment of tax dues before any payments are made to shareholders?

It is considered that Section 18A, if properly enforced, gives sufficient safeguard for the payment of tax dues in the case of a Company which subsequently goes into liquidation.

Question 91.—Do you think that, in order to minimise evasion and avoidance of tax, there is a case for conferring larger powers on income-tax authorities? If so, what further powers should be given to them? In particular, should powers to search premises and seize documents and books of accounts be given to Income-Tax Authorities? If so, what is the lowest grade of officer on whom you would confer these powers?

It will be recollected that Clause 38 of the Income-tax Amendment Bill, 1951 proposed to introduce very wide powers, amongst others giving any Income Tax Authority the right to impound and retain in its custody any books of account or other documents produced before it and it was further proposed to introduce into the Income-tax Act a new Section 37A giving power of entry.

These proposals met with almost universal condemnation at the time of the introduction of the Bill and were subsequently dropped.

The comments of this Chamber on the particular Clause were as follows:

"The proposal that any Income-tax Authority may impound and retain in its custody, for such period as it thinks fit, any books of account or other documents produced before it in any proceeding under this Act will, it is considered, lead to hardship in many cases. It is therefore suggested that

the sub-section should be amended to read as follows:—

'Any Income-tax Authority not below the rank of Inspecting Assistant Commissioner may order the impounding and retention for a reasonable period, of any books of account or other documents produced in any proceeding under this Act, provided that the assessee shall be allowed reasonable access to the books or documents and to make extracts therefrom.'

As regards the proposed new Section 37A, this Chamber considers the proposals wholly objectionable as they infringe on the liberty of the subject. If an Income-Tax Authority desires to enter and search, the tax-payer must be given the same rights as he has under the Common Law and the Income-Tax Authority must obtain a search warrant by application to a First Class Magistrate."

The views of this Chamber in this regard remain unchanged and have been met to some extent by Sub-Section 2 of Section 37 that books and documents may not be retained for longer than 15 days without authority from the Commissioner.

Question 92.—*What precautions are necessary and possible to prevent the creation of an artificial legal entity—a trust or a private limited company or a partnership, especially family partnership—either for avoiding payment of income-tax or for fractioning of income to escape higher rates? Would you recommend the use of penalty rates of tax to minimise such practices?*

This Chamber is of the view that the taxpayer is fully entitled to reduce his tax liability by any legal method of which he is able to avail himself and the suggestion that penalty rates of tax should be imposed in cases of persons who have by legal methods been successful in reducing their tax liabilities is not only wholly objectionable but legally indefensible.

As regards illegal evasion of tax, it is considered that the present penal provisions contained in the Act are adequate.

Recovery

Question 93.—*In the case of a registered firm, would you advocate recovery of unrealised tax of any partner from the firm as such or from other partners?*

The point raised in this question appears to be covered by the provisions of the Indian Partnership Act 1932.

Question 94.—*Are present arrangements relating to recovery of income-tax adequate? Would you advocate the Income-tax Department having a separate machinery for enforcing the recovery of arrears of tax?*

It is considered that the present provisions of the Income-Tax Act regarding recovery are adequate, provided they are properly administered.

Question 95.—*What provisions should be made to ensure timely collection of tax from private limited companies? Do you consider that liability for payment of tax in such cases should be placed upon shareholders of the company in proportion to their share-holdings?*

It is considered that under the present provisions of the Income-Tax Act for advance payments of tax, if properly applied, and provided that the machinery of assessment is not unduly delayed, there should be adequate protection secured to the Revenue against losses of the nature envisaged by the question. The fact that there may be a few cases of the Revenue being defrauded through the means of a Private Limited Company, should not be permitted to destroy the principle of limited liability.

Question 96.—*If income from any property is included for assessment purposes in the hands of a person other than the ostensible owner, would you agree to the tax so assessed being also made recoverable from such property?*

If the transfer of the property is proved to have been made with the intent of illegal evasion, it is agreed that in such cases tax correctly assessed on the income arising from the property should be made recoverable from the property itself.

GENERAL

Question 97.—*What concrete measures should be taken to improve the relations of the Income-tax Department with assessees, especially in regard to—*

- (i) provision of free advice to small assessees on the following points:
 - (a) maintenance of accounts in a form acceptable to the Income-Tax Department; and
 - (b) matters such as filling returns of income, claiming refunds, facilities for tax payment, expeditious disposal of assessments, etc.;

- (ii) provision of information on various matters relating to assessment proceedings, such as disposal of refund applications, adjournment applications, examination of records, etc.
- (iii) arrangement of work so as to obviate necessity of assessees or their representatives having to wait in Income-tax Offices unduly long periods; and
- (iv) securing of the largest measure of agreement on facts between the assessee and the department at Income-Tax Officer level?

In the opinion of this Chamber the relations between the Income-Tax Department and the public, particularly small assessees, will only improve with Income-Tax Officers and their staffs learn to look at themselves as public servants with one duty only—assess the taxpayer fairly and correctly within provisions of the Law and in so doing, to elicit from the assessee all the facts concerning his case, both of which benefit the taxpayer as well as those which are to the Department's favour.

In order to improve relationships between the taxpayer and the Department, we advocate the establishment of a Public Relations Section within the Department, with a Public Relations Officer attached to the Assistant Commissioner.

Such P. R. Os would have nothing to do with assessments or investigation proceedings and their duty would be to help the taxpayer over such matters those raised in this question.

Question 98.—*What changes would you suggest in existing arrangements relating to:*

- (i) issue of notices;
- (ii) simplification and filing of returns,
- (iii) levy of penalties;
- (iv) recovery of tax; and
- (v) appellate procedure and machinery, particularly with reference to administrative control of Appellate Assistant Commissioners?

No comment on points (i) to (iv) as these have already been dealt with in replies to previous questions.

(v) As regards appellate procedure and machinery this Chamber considers that the Appellate Assistant Commissioner, who is at present subordinate to the Central Board of Revenue, should, as an Appellate Tribunal—be directly under the Legal Department of the Central Government.

Question 99.—(a) *Do you think that undue delay occurs at present in the course of assessment proceedings? If so, what do you attribute this to and what are your suggestions for remedying this?*

- (b) *in order that delays of the kind mentioned above do not appreciably affect collection of a substantial portion of the tax due, should any special concessions be provided to assessees to induce them to make advance payment of tax?*

(a) It is considered that there is at present undue delay in completing assessment proceedings mainly due to the experience of this Chamber, to

- (i) lack of properly trained clerical staff;
- (ii) apparent inability of Income Tax Officers to reach decisions without constant reference to the Assistant Commissioner.

(b) In the opinion of this Chamber, any proposal to encourage the making of advance payments of tax will only result in defeating the object of reducing present delays in finalising assessments, since the fact that tax is collected in advance is one of the factors which lead to delay in completing assessments. If the tax were payable in advance, the assessment would have to be completed much more quickly in order to obtain collection.

In the opinion of this Chamber the solution to the problem must be in

- (i) improvement in the efficiency of the Department
- (ii) insistence on Income Tax Officers taking responsibility to complete assessments.

Special Business Taxes

Question 100.—*What, in your opinion, would be the circumstances, which would justify the levy of Excess Profits Tax or special business taxes?*

In the opinion of this Chamber the levy of Excess Profits Tax or special business taxes can only be justified in case of grave national emergency.

Death Duties

Question 101.—*What are your main reactions to the Estate Duty Bill at present before Parliament?*

This Chamber does not wish to comment on the principle underlying the levy of an Estate Duty or whether the imposition of this tax is justified at this stage of the Country's economic development but the Chamber wishes to say that, in its opinion, Estate Duty, being a tax on capital, should only be used for

the purposes of capital development envisaged under the Five-Year Plan.

It is, in the opinion of this Chamber, wrong that a tax on capital should be utilised for general revenue purposes.

This Chamber hopes that, before the levy of an Estate Duty is actually introduced into operation, adequately trained staff to administer the Act will be placed in position.

Finally, this Chamber hopes that every effort will be made to ensure that adequate arrangements will be made for reciprocal relief with other countries where payment of Estate Duty is involved in more than one country.

Question 102.—Would you in the matter of rates of levy differentiate between self-acquired property forming the estate of a deceased and property inherited by him?

In the opinion of this Chamber there is no necessity to provide for different rates of Estate Duty as between self-acquired property and inherited property.

PART III.—COMMODITY TAXES (Central and State)

CUSTOMS

Import Duties.

Question 103.—Do you think that any changes are necessary in the Indian Customs Tariff in respect of—

- (i) grouping of commodities;
- (ii) additions to and alterations in tariff items;
- (iii) correlation with the Import Trade Control Schedule;
- (iv) clarification in nomenclature and in units of measurement or weight?

(i) Grouping of commodities:

No wide general changes are required in the Customs Tariff Schedules and any such changes would be liable to cause confusion. It is, however, suggested that the anomalies which come to light from time to time should be referred immediately to a Central Authority by the Collector of Customs concerned and that this Authority should decide how an item should be classified in future and advise the public and all ports immediately.

(ii) Additions to and alterations in tariff items. No changes are necessary.

(iii) Correlation with the Import Trade Control Schedule.

It is understood that the Central Government are at present working on this particular question of correlation.

(iv) Clarification in nomenclature and in units of measurement or weight.

Please see the answer to (i) above.

Question 104.—(i) What considerations should govern the fixation of rates of import duties for different groups or sub-groups of commodities or for special tariff items?

(ii) Have you any modifications to propose in the present rates of duties in the light of the considerations suggested by you?

(iii) Do you consider that import duties should be reduced in respect of any specific commodities in order to reduce the scope for smuggling?

(iv) Are there any cases within your knowledge where duties on the constituent parts are higher than on the finished product? Is there adequate justification, in your opinion, for this differentiation?

(v) Do you think that owing to high rates of duties the yield on any commodity has reached the point of diminishing returns?

(i) All raw materials required by indigenous industries should be allowed in at nominal rates and the same consideration should be applied to materials required for agricultural developments which are necessary for the common welfare of the country.

(ii) to (iv)—No comments.

(v) Yes—since these very greatly enhanced rates of Import Duties introduced in April 1953 there are already indications that demand has fallen, thereby, eventually, leading to diminishing returns.

Question 105.—Is the relative use of ad valorem and specific duties in the Indian Customs Tariff satisfactory? If not, in what respects would you enlarge or restrict the scope of application of either whether used singly or in combination?

Yes, it is satisfactory.

Question 106.—(i) In what circumstances would you consider "tariff values" a satisfactory basis for assessment of import duties? (Section 22 of the Sea Customs Act.)

(ii) Are there any commodities to which you would extend the application of "tariff values"?

(iii) What changes, if any, should be made in the procedure for determining "tariff values"?

(i) Under circumstances in which world prices of the commodities concerned are subject to considerable fluctuations.

(ii) Subject to the above.

(iii) No change is necessary.

Question 107.—(i) What changes in your opinion are necessary in the present provision (Sec. 30 of the Sea Customs Act) regarding the determination of "real value" and why?

(ii) Would you suggest any specific measures to counter the evasion of import duties through deliberate under-valuation?

(iii) Have the methods of valuation in the Sea Customs Act proved satisfactory in relation to trade through the land customs border, especially on the Indo-Pakistan border? If not, have you any specific suggestions to make in this regard?

(i) No change is necessary.

(ii) The Customs authorities have already the necessary powers.

(iii) No comments.

Question 108.—What changes would you suggest in the matter of granting exemptions from, or reductions in, import duties especially in regard to:

- (1) raw materials used for essential industries;
- (2) materials used for scientific research;
- (3) materials imported for charitable and humanitarian purposes;
- (4) materials imported for stimulating desirable activities, such as agricultural development; and
- (5) necessities of life?

(1) to (5)—Reductions or remissions of duty in respect of these five items deserve the Government's sympathetic consideration when revenue permits.

Question 109.—To what extent do you think revenue might be sacrificed in the interests of bilateral or multilateral fiscal arrangements such as G.A.T.T. or the preferences in favour of certain Commonwealth Countries.

This is for the Government to decide.

Question 110.—Under what circumstances should customs duties be used in preference to import quotas as a means of restricting imports?

If the purpose of restricting imports is to protect indigenous industries, then Customs duties should be used. If, however, the purpose is to conserve foreign exchange, then import quotas should be imposed.

Question 111.—In what respects should the present law regarding "drawbacks" and "warehousing" be altered in order to assist the export trade in manufactured goods which involve the use of imported raw materials?

The application of drawback to raw materials imported by industries who subsequently export the finished product should be universal and at the rate of 100 per cent.

Question 112.—Have you any suggestion to make regarding the administration of the Sea and Land Customs Acts, especially in regard to—

- (a) facilities for settlement of disputes arising out of appraisement;
- (b) penalties imposed under the Act and the appellate procedure relating to them?

(a) The routine procedure involved in obtaining refund of duty on goods damaged at the time of discharge from the steamer after the "out of charge" order has been given by the Customs Department is unnecessarily arduous. In a specific case, Bills of Entry were presented on 6th May 1952 and 7th May 1952 respectively and the goods assessed to duty on 7th May 1952 and 8th May 1952. On 19th May 1952 a severe storm arose, as a result of which a considerable portion of the shipment was lost overboard or so damaged as it had to be subsequently destroyed. The claim had first to be submitted to the Assistant Collector of Customs (Appraising) who ruled that as the loss took place after the "out of charge" order was given, it was a trade risk to be borne by the importer. Section 33 of the Sea Customs Act relates to damage before delivery of the Bill of Entry. The claim was therefore rejected. An appeal against this order lay to the Collector of Customs who, however, rejected the appeal on similar grounds. Thereafter an appeal was made to the Central Board of Revenue who referred the matter back to the Collector of Customs for his recommendation. At this stage the Central Board of Revenue might have used its discretionary powers.

It is suggested that this prolonged procedure could be cut down considerably and if that is not possible that

Collectors of Customs should possess powers to settle such claims and that at least direct reference by the Collector or by the Importer to the Central Board of Revenue would have saved considerable time and trouble. It is also considered reasonable that under the circumstances of this case a refund was due to the Importer and it should not be left to depend solely on the discretionary powers of the Board.

(b) The period of three months allowed to both Customs and importers in which to make claims for duty paid short or in excess is too short. Importers not infrequently discover such mistakes in audit and an increase in the time limit for demands by Customs or appeals by importers is desirable. It is suggested that the time limit be increased to 12 months.

EXPORT DUTIES

Question 113.—Under what circumstances, in your opinion, should export duties be imposed?

Export duties could (but whether they should be levied would depend on careful consideration of the particular circumstances) be imposed for the following purposes:—

- (a) The conservation of essential raw materials for current or future use within India.
- (b) Moderating the export of even plentifully available raw materials to countries which could by the use of materials at advantageous prices, deprive India of export trade in finished products made from the relative raw materials.
- (c) As a means of raising Government revenue by the collection of Export duty on agricultural or industrial products for which there is a lasting demand overseas, and considerable profits to those concerned in the export of the products concerned.

Purposes (b) and (c) are already recognised by the present and past practice of Government, but in the view of this Chamber, the practice in these respects should be exercised with the greatest care, as in it the following dangers are inherent:—

- (1) The temporary and even permanent loss or reduction of India's export trade owing to the administration's difficulty in reducing or removing the Export duty quickly enough to suit changing circumstances.
- (2) Arising from (1):—
 - (a) The loss of Foreign Exchange;
 - (b) The accumulation of the products concerned within India resulting in disturbance of internal economy;
 - (c) Increase of unemployment.

Question 114.—What measures would you suggest to achieve greater flexibility in the rates of duties to accord with the changing conditions of export markets?

It is probable that India's export trade has suffered permanent loss owing to the failure to adjust rates of export duty in good time. Government's delay in such matters may have arisen because of the preoccupation of members of Government at high level with other vital matters and due to the need which Government have felt for the careful collection and the examination of evidence in support of the case for adjustment of export duty rates.

This Chamber suggests that with a view to arriving at speedier decisions, on one or other of the existing Advisory Councils there should be adequate representation of the industries which are concerned in any export duties which may be in force. If necessary, a new Advisory Council or sub-council may be created.

Question 115.—Would you suggest that the whole or a part of the receipts from certain export duties should be funded for financing schemes for promoting long range development of the export trade, subject to the obligations under G.A.T.T.?

It is not recommended that the whole or part of receipts from export duties should be funded for the purpose suggested, but as export duties are usually appropriated to general revenue account, any funds which it may be judged can usefully be devoted to the purpose of promoting exports should be provided from general revenue.

Question 116.—Would you in the interests of revenue or from any other point of view, recommend increased participation by the State in import and export trade? If so, what form do you think should such participation take?

This Chamber does not form any point of view at present recommend the increased participation by the State in the import or export trade. These remarks are made with reference to trading as a whole and do not cover the import of food grains, sugar or other essentials of life, to the extent that this may be necessary in the national interest.

CENTRAL EXCISES

Question 117.—Do you regard as satisfactory the present selection of commodities for purposes of levying excise duties? If not, what changes would you suggest and why?

It is understood that the Imperial Tobacco Co. of India Ltd., our principal member in this industry, has submitted its opinions on Questions 117 to 123 direct to the Commission and also supplied information on these questions to the Bengal Chamber of Commerce & Industry. It is considered unnecessary, therefore, for this Chamber to answer these questions.

Salt Duty

Question 124.—Would you recommend the re-imposition of the excise duty on salt? If so, on what conditions?

It is considered that the Salt Tax should be re-imposed. Its removal has sacrificed a very considerable revenue for purely idealistic reasons and the actual burden of the tax on the individual is infinitesimal.

Supplementary Note on Question 124—Salt Duty

"The 10 acre scheme" is a concession granted by Government to manufacture salt freely by whatever process desired by the small scale producers, viz., either by solar evaporation, or by boiling brine or by scraping or excavation and extraction of saline earth, there being no need to obtain a licence for such manufacture and also no need to pay any cess to the Salt Department, the only restriction being that the area under operation held by any individual or group should not be larger than 10 acres. The policy governing this scheme was to increase production of salt in the country by providing sufficient incentive to small producers and was introduced in 1948. This scheme originated from the Gandhi-Irwin Pact of 1931 when salt was permitted to be scraped even from salt swamps and later extended up to a limit of 10 acres.

However, in the actual implementation of this policy the following anomalies and difficulties were met with and the concession was largely abused.

(1) Initially the manufacture of salt could only be done by a person holding a licence granted by Government and under this system there were both large scale manufacturers and a good number of small licencees operating areas even less than one acre. When the 10-acre concession was granted in 1948, the regular licencees were still under the obligation of securing licences while the new manufacturers with less than 10 acres were completely free.

(2) The new manufacturers started 10 acre plots in the name of several members of a family with a view to evade the provisions of Central Excise and Salt Act. Salt traders provided finances to hereditary salt workers to set up 10 acre factories in contiguous areas and secured exclusive rights to buy the entire salt production and evaded payment of salt cess.

(3) The quality of salt considerably deteriorated as it was not feasible to make a high quality in small holdings by solar evaporation.

The technical principles involved in the manufacture of solar salt require large areas to be set apart to ensure efficient operation. The Salt Expert Committee constituted by Government in 1948 have dealt with the subject of economic production of good quality salt by solar evaporation and they recommend an area of 100 acres as an economic unit for salt manufacture. They therefore, suggest that all small holdings now being operated should be consolidated, relaid and brought under technical control in units of 100 acres as a minimum.

The reimposition of Excise Duty provides an additional source of revenue to Government, although it is an extra charge on the consumer. We would welcome this reimposition in as much as Government will be able to enforce with greater effect, all measures required to improve the yield and quality of salt in the factories."

Taxes on the Sale or Purchase of Goods and on Advertisements

Question 125.—Under the Constitution, the only sales or purchases which can be taxed are sales or purchases of goods. Do you consider that the sales tax should be extended to—

- (i) services, so that the tax may be leviable on
 - (a) charges for services proper (e.g., bills from a goldsmith or a printer),
 - (b) charges for both services and goods where the two cannot be readily separated (e.g., hotel bills) and
 - (c) charges for certain types of goods into the price of which service enters as a substantial element (e.g., painting or photographs); and
- (ii) transactions of sale or purchase in stock exchanges and futures markets?

If so, please deal with the administrative and other issues which may arise in the implementation of your suggestions.

(i) (a) No. Such dealers are already liable to Income Tax and Profession Tax. They only "sell" their skill which cannot easily be assessed in terms of money. Experience shows that States fix rates of tax to suit their financial needs. If such services are taxed too highly in one State they will not be able to meet outside competition and will either have to close down or migrate to more favourable areas.

(i) (b) Under Rule 4(3) of the Madras Sales Tax (Turnover and Assessment) Rules provision is made for taxing a portion of such transactions. The rates vary with the nature of the contract and have been worked out after detailed consideration. It is considered that this arrangement is not unreasonable, particularly so as some latitude is allowed to the Madras Board of Revenue to use its discretion in unusual cases. Any attempt to fix more exactly the tax payable on such transactions would, it is considered, involve such an increase in staff as would not justify the results obtained.

(i) (c) Not justified for reasons given under (1)(a).

(ii) Stock Exchange dealings are already subject to Transfer Stamp Duties and therefore it would not be reasonable to attempt to impose Sales Tax on them.

Question 126.—(i) The Union alone has the power to levy a tax on sale of newspapers or on advertisements in them. This power has not, so far, been exercised. Would you propose as desirable and feasible (a) a tax on sales only, or (b) a tax on advertisements only, or (c) a tax on both?

As regards (a), it has been urged that on account of the small price charged for each newspaper, the sales tax would be fractional and cannot be passed on to the buyer, whereas in the aggregate it would be an undue burden on the concern itself. If you agree with this, how would you meet the difficulty?

As regards (b), what classes, if any, of newspapers or advertisements would you exempt from the tax, and what rates of tax, graded or other, would you levy?

(ii) Have you any suggestions to make regarding the taxation of advertisements other than those appearing in newspapers?

(i) (a) For the reasons given it is not, equitable to tax the owner of the newspaper when, unlike other dealers, he cannot pass on the tax to the buyer. This would be unfair discrimination.

(i) (b) Advertisements in newspapers may be either casual or regular but it would be difficult to distinguish between them in practice. The staff necessary to decide between taxable and non-taxable advertisements would not justify the results achieved and the vexation caused.

(i) (c) No tax is recommended.

(ii) A small tax on posters and public trade advertisements appears to be unobjectionable, but separate legislation is necessary and not under the provisions of the Sales Tax Act.

Question 127.—As regards sales tax generally and, in particular, the sales tax on goods leviable by the States, it is sometimes argued that since all goods sold in a State must fall within one of these categories, viz., (a) manufactured or produced within the State, (b) transported into the State from elsewhere in the country and (c) imported into the State from abroad—an extension of increase of excise would serve just as well as sales tax for category (a), of octroi or terminal tax for category (b), and of customs for category (c). Do you agree with this view which implies that the sales tax has no specific function to perform in the country's system of taxation? If not, what in your opinion, from the point of view of a correlated tax-structure, is the legitimate place and scope of the sales tax as distinguished from that of excise, octroi and customs?

This Chamber considers that customs and excise duties have a definite place in the tax structure of any country and are necessary to the national economy, but the levy of local octroi or terminal taxes has no justification whatsoever. They impose medieval restrictions on the free movement of commodities with the attendant evils of inefficiency and corrupt administration. Similarly, Sales Tax has the undoubted effect of restricting business activities and diverting the natural channels of trade and the only possible justification for a Sales Tax is that it is a means of raising substantial revenue for the States. Unless, however, the rates of Sales Tax are kept low they have a regressive effect (for examples of this please see the answer to Question 134 below).

Question 128.—(a) Sales tax is almost invariably levied by the State Governments in terms of the turnover of the dealer over a given period. Since a sales tax leviable on the individual transaction necessitates fairly elaborate accounts, cash memos, etc., which only a small portion of dealers is equipped to maintain, do you agree with the view that, in Indian conditions, the bulk of the sales tax is likely for a long time to come, to continue to be leviable on

aggregate turnover as distinguished from the individual sale-price?

(b) In most States there are separate laws governing sales tax on petrol. To what articles, if any, do you consider it desirable and feasible to extend the particular system adopted in respect of petrol?

(a) This Chamber agrees that it would not be feasible to introduce a sales tax at differing rates on various individual articles, though certain specified articles are subject to a special rate of sales tax in Madras State [see Section 3(2) of the Madras General Sales Tax Act].

(b) State taxation on petrol in Madras State is governed by the Madras Sales of Motor Spirit Taxation Act, 1939. It is a single point tax levied at the point of retail sales. Under this Act the rate of tax for petrol is 6 as. per gallon and for motor spirit other than petrol it is 1 a. 6 ps. per gallon. Kerosene (other than power Kerosene) is now taxed under the Madras General Sales Tax Act. All importers, agents and most dealers are liable for this Sales Tax. This multipoint tax on Kerosene is not only irksome but also has the effect of increasing the consumer price of what is undoubtedly a necessity of life, particularly for poor people. It is considered that either Kerosene should be exempted entirely from Sales Tax or that it should be taxed at one point only.

Question 129.—(1) In regard to a system of levy based on turnover, is the choice broadly limited to the alternatives hereafter mentioned or is there any other system you would advocate? Under the system you recommend would sales tax continue to be roughly as significant a source of State revenue as at present? The alternatives referred to above are:

(i) a relatively low rate of levy at each of almost all points of sale; few dealers excluded and few goods exempted (Multi Point);

(ii) a relatively high rate of levy at only one point, viz., the point at which a registered dealer sells either to a consumer or to an unregistered dealer; exemption from tax of sales by one registered dealer to another registered dealer; exclusion from compulsory registration of a dealer below a certain limit of turnover; a large number of exempted goods (Single Point);

(iii) various combinations of the above.

(2) Which of the above alternatives would you advocate? Please state your reasons in some detail, comparing merits and demerits from the point of view of (a) the consumer, (b) the dealer, (c) industry, trade, etc., generally and (d) Government. Please relate your arguments, as far as possible, to lessons which may be drawn from the actual working of Sales Tax Acts in different States.

(3) In particular:

(i) as regards (a) above, do you think that the sales tax, or any particular form of it, leads to a greater burden being placed on the consumer than is accounted for by the proceeds which accrue to the Exchequer?

(ii) as regards (b) above, have you any suggestions to make regarding the simplification of forms, accounts, etc., and of the procedure generally in order to make the administration of the tax less burdensome to the dealer? Further, having regard to the cost of maintenance of the machinery for compliance, would you suggest an alternative form of taxation so far as small dealers are concerned?

(iii) as regards (c) above, has the imposition of the sales tax led to any noticeable change in the organisation of the trade in the country, especially in regard to the size of the business unit, location of head offices, number of intermediaries, variety of the goods dealt with, etc.?

(iv) as regards (d) above, please examine the financial and administrative aspects, including the scope for evasion presented by the particular system and the difficulty or otherwise of counteracting it.

Since all the Sales Tax Acts in South India provide for the Multi-Point system it is difficult for this Chamber to express an opinion on the rival merits of Single and Multi-Point taxes. It is believed that from the administrative angle (both official and business) there is little difference in practice between the two taxes as each dealer, whether liable to tax or not, has to maintain accounts which the tax authorities must check. The consumer, probably, would prefer the Multi-Point tax, provided its total incidence is not more than a Single-Point tax, because the amount apparently charged to him appears to be smaller than it really is. One cause of vexation should, however, be removed. The State should be prohibited from attempting to assess Sales Tax on sales tax collected by the dealer on the illogical grounds that it forms part of the dealer's turnover.

Question 130.—*In relation to the particular system you advocate :*

- (i) *should there be special rates of levy, higher than the ordinary rate, for certain articles? If so for which types of articles?*
- (ii) *should there be special rates of levy, lower than the ordinary rate, for certain articles? If so, for which types of articles?*
- (iii) *which articles, if any, should be exempted altogether and why? Please elaborate the principles which, in your opinion, should underlie exemptions.*

(i) As observed in commenting on Question 128(a) such differential taxes already exist in Madras State and generally speaking there has been no serious objection to them.

(ii) Under the Madras General Sales Tax Act certain articles are taxed at the point of purchase because they are normally exported. Certain articles (such as Bullion) only require a licence as the profit is very small. Certain articles are only taxed once (e.g., raw cotton, tanned hides, etc.) as the margin of profit is small and it is necessary to keep the incidence of the tax low in order not to interfere with the volume of trade. It is difficult to specify which articles should be taxed lightly since conditions vary from State to State.

(iii) Certain goods, such as the first sale of agricultural produce and sale of handloom goods are already exempted from sales tax in Madras for obvious reasons.

Briefly stated, the reasons for varying the incidence of tax are:—

- (1) the nature of the article—whether luxury or essential;
- (2) the margin of profit obtained on the sale of the article;
- (3) the nature of the trade, e.g., whether export trade or other trade to be particularly encouraged;
- (4) exemption for certain classes of goods, for special reasons, some political and some local.

On the whole, these considerations appear to be reasonable and unobjectionable, provided there are not too many variations or rates of tax on too many varieties of goods.

The articles exempted by the Government of India Notification under Article 286(3) of the Constitution and those listed in the Madras General Sales Tax Act and Rules are recommended for exemption throughout India for the reasons accepted by the Central and Madras Legislatures.

Question 131.—*In regard to system, rates, exemptions, etc., what degree of uniformity between the different States do you consider desirable and feasible? Would you bring it about—*

- (i) *by formal or informal convention;*
- (ii) *by central legislation promoted at the instance of two or more States;*
- (iii) *by constitutional amendment, so as to include certain basic matters connected with the sales tax in the Concurrent List?*
- (iv) *by constitutional amendment so as to include the item of sales tax, as a whole, in the Union List? In the last-mentioned how would you apportion the proceeds? Would this alternative be a practicable proposition from the point of view of the finances of the States?*

It is desirable to have uniformity but some variations are unavoidable in a country so large and diversified. The basic principles should be uniform throughout the country, with uniformity of definitions and in the methods of administration. Either Single-Point or Multi-Point tax should be imposed throughout the country and variations should not be permitted. Certain articles should bear a heavier or lighter rate of tax to suit local conditions and may either be on purchase or on sale, provided legislation is introduced to ensure that no transaction can be taxed twice. If possible it is desirable to have uniform rates of tax on the nonparticularised goods though this may be difficult to impose when the States vary in their financial circumstances. The method by which these results are to be achieved must be decided by the Central Government with the power, if necessary, of compelling non-co-operative States to conform to the general policy.

Question 132.—*To what extent has any desirable uniformity been achieved in regard to exemptions (in favour of "goods essential for the life of the community") under Clause (3) of Article 286 of the Constitution? What principles would you advocate for deciding the exemptions to be made under this provision of the Constitution? Do you consider that the scope of the provision contained in Clause (3) of Article 286 should be extended also to "essential articles" which had been subject to sales tax before the relevant central enactment came into force?*

So far as Madras State is concerned no "desirable uniformity" has been achieved. The list of essential articles detailed in the Notification issued by the Government of India under Article 286(3) of the Constitution, plus, it is considered, firewood and the tools of an artisan's trade, should be exempted from Sales Tax throughout India because these articles constitute the basic and unavoidable necessities of life. The total exemption recommended should be extended to those articles in the list which are now taxed by certain States.

Question 133.—(a) *As regards "sales outside the State", "inter-State commerce", etc., please discuss the adequacy or otherwise of the relevant provisions of Article 286 and suggest remedies for any defects which, in your opinion, have been revealed in the actual working of these provisions.*

- (b) *Please discuss in this connection the desirability and feasibility of the suggestion that purchases only (and not sales) should be taxed, so that the tax jurisdiction of each State might be confined to parties, residing within the State. Alternatively, do you consider that purchases should be taxed in certain cases and sales in certain others; if so, how and on what considerations would you define the two categories? In either case, please describe your scheme in some detail and explain the advantages which you claim for it.*

(a) It is understood that some prominent legislators have said that when they helped to draft and approve Article 286 of the Constitution they intended that transactions involving inter-State and international trade should be exempted from Sales Tax. The Supreme Court in its recent judgment has held that the Article in its present form does not convey that intention and if the Legislature is of opinion that such transactions should not attract Sales Tax, clearly it will be necessary to amend the Article.

If, however, the intention of the Legislature is what the Supreme Court has held the Article to mean, it is considered that further legislation is necessary so as to provide that the taxing authority of one State cannot levy its tax on a seller resident in another State. The reasons for this have been given in detail in the Memorandum submitted by the Federation of Indian Chambers of Commerce to the Government of India. Briefly stated these reasons are:—

- (1) The selling dealer outside the State cannot possibly know all the rates of tax, exemptions, notifications, etc., issued by the 15 States now levying Sales Tax.
- (2) The outside dealer would have to maintain separate accounts for each taxing State within which he transacted business and even then his accounts may be called for by several taxing officers in one State if his transactions overlap several taxation jurisdictions.
- (3) It would be intolerable for a firm with All-India sales to answer the demands, etc., of a host of officials scattered throughout the country.
- (4) The honest dealer would be seriously disadvantaged, as the unscrupulous would take advantage of the administrative and other difficulties in attempting to collect from a seller outside the taxing State and so, by evading the tax, be able to under-quote his more honest competitor.
- (5) Administratively, it would be difficult to collect the tax from a dealer outside the State and the procedure of recovery is laborious prolonged and often infructuous. If the accounts, etc., are maintained in any other language than that known to the taxing officials they would be at the mercy of the unscrupulous.

For these reasons the only practicable solution is that in respect of inter-State transactions the purchaser in the receiving State should bear the tax.

Question 134.—*Do you think that lack of uniformity between the States as regards the rates of sales tax and the methods of applying it (single or multiple point) has the effect of raising barriers in inter-State commerce or of inducing uneconomic diversions of trade? If so, what measures would you suggest to rectify the position?*

Please see answer to Question 127. Where States sales taxes are imposed at differing rates, transshipments are made by dealers from markets with a low tax to rate to markets with a higher tax rate, with the result that the pattern of trade is dislocated and tax evasion is encouraged.

The following are examples of the regressive effect of trade when exorbitantly high rates of Sales Tax are levied. In April 1953 the Madras Government introduced a sliding scale of tax on cigarettes, cigars and tobacco, varying from 10 per cent. to 30 per cent. dependent on the quality of the article, i.e., the more expensive cigarettes, etc., paying the higher rate of tax. For the four months prior to April 1953 the monthly sale of

cigarettes in the State was Rs. 37 lakhs, Rs. 38 lakhs, Rs. 41 lakhs and Rs. 45 lakhs respectively. After introduction of the new rates sales in the next four succeeding months were Rs. 20 lakhs, Rs. 16 lakhs, Rs. 18 lakhs and Rs. 16 lakhs respectively. The enormous loss to the producers, manufacturers and dealers is obvious and entails unemployment and loss of Income-Tax to the Central Government. In November 1952 the Madras Government introduced a Sales Tax of 50 per cent. on the selling price of Wines, Beers and Spirits. The following figures illustrate the effect of this very heavy tax:

	Period 24-5-52 to 23-11-52	Period 24-11-52 to 23-5-53
	Rs.	Rs.
Total value of sales <i>excluding</i> gallage and Sales Tax within Madras State	18,17,224	8,47,655
Central Govt. Customs Duty on above	8,35,417	3,83,546
Gallage fees paid on above	1,21,605	70,603
Sales Tax paid	Nil.	3,88,538

It will be seen that sales dropped 53 per cent. approximately.

Gallage fees are collected for the Madras Government, and these fees with the Sales Tax show a nett gain to the Madras Government of Rs. 3,37,536. Against this, there is a loss to the Central Government by way of import duties of Rs. 4,51,871, which means that so far as overall taxation is concerned the nett loss to India was Rs. 1,14,335. To this should be added the additional loss to the Central Government of Income-Tax from lower profits as a result of sales dropping by 53 per cent. The regressive effect of attempting to levy an exorbitant rate of sales tax is well-illustrated by these examples. The nett tax yield is reduced, profits fall, the consumer is fleeced and unemployment results. The ugly side of the story is the growth of smuggling, corruption and illicit distillation with the added charm of forbidden fruit.

Question 135.—No comments.

GENERAL

Question 136.—Do you think there is a case for vesting in the administration the power to alter, by executive order, the rates of import duties, export duties and excise duties? If so, please indicate in what circumstances and within what limits such power should be exercised.

In the view of this Chamber, there is no case for vesting powers of taxation in the Administration, and the levy of revenue must be the sole prerogative of Parliament.

Question 137.—Do you visualise any scope for extension of the field of commodity taxation as a result of the implementation of the Five-Year Plan?

No comment.

Question 138.—What "luxury" articles, if any, would you suggest on which commodity taxes in any of the various forms might be levied at specially high rates?

In the experience of this Chamber, the present rates of taxes of various kinds, both direct and indirect, on "luxuries", and on many articles which can only be brought within that definition by a considerable stretch of the imagination, are now so heavy as to make the purchase of such articles well-nigh prohibitive to all except persons who have inherited large fortunes.

Certainly, the ordinary businessman, deriving his income from heavily taxed earnings, cannot indulge in the purchase of "luxuries" at their present-day cost.

The disastrous effect of levying prohibitive taxes on tobacco and liquor has been detailed in answer to Question 134. Consumer resistance was immediate and sustained; overall tax revenue fell; the producer, manufacturer and dealer lost heavily, with consequent increased unemployment and consumer resentment.

PART IV.—AGRICULTURAL INCOME-TAX, LAND REVENUE AND IRRIGATION RATES

AGRICULTURAL INCOME-TAX

Question 139.—A few States levy agricultural income-tax but in almost none is it among the more important sources of revenue; the progress of land reforms will further reduce its yield. Would you, in order to increase the yield from this tax or for other reasons (which may please be specified), make major modifications in the present system of taxation of agricultural income? If so, please indicate the modifications you would make.

Question 140.—In particular, do your suggestions involve—

- correlation, and if so, to what extent, of agricultural with non-agricultural income-tax;
- alteration, and if so, in what manner, of the levy of land revenue?

As regards (a), if the correlation suggested takes the form of the levy of a single tax on the total of non-agricultural and agricultural income, instead of the present separate Central and State taxes, please deal with the constitutional, administrative and other problems involved, including the apportioning of proceeds among State Governments. Alternatively, if the State Governments continue separately to levy a tax on agricultural income, but the rates of levy are based on the total of the two types of income, agricultural and non-agricultural, what are the specific problems which arise, and how would you deal with them?

As regards (b), please indicate the probable net effect of the suggested measures on the revenues of Government. What administrative or other issues are involved, and how would you deal with them?

The basis for granting exemption from Indian Income-Tax for Agricultural income was that the lands suffered land revenue. The severity of the charge of the land revenue is however noticed mainly in the case of small land-holders.

On the above reasoning some States have introduced the levy of agricultural Income-Tax but there is complete lack of uniformity either in regard to the levy or in regard to the rates of taxation in the various States. The suggestion is therefore made that Agricultural Income-Tax may be made the subject matter of a central levy for the benefit of the States. Agricultural income may be aggregated with non-agricultural income for the purpose of determining the rate of Income Tax applicable to the non-agricultural income but the agricultural income should be charged at a reduced scale of tax, suggested as follows:—

Incomes under Rs. 6,000	Nil.
Rs. 1 to Rs. 6,000	Nil.
Rs. 6,001 to Rs. 10,000	6 pies in the rupee.
Rs. 10,001 to Rs. 20,000	1 anna 6 pies in the rupee.
Rs. 20,001 to Rs. 30,000	3 annas
Over Rs. 30,000	4 annas

Companies at a flat rate of 4 annas.

Marginal relief to be provided for.

The revenue so collected from Agricultural Income Tax should then be passed on to the State from which the income is derived.

This suggestion involves an amendment to the Constitution but the principle of the suggestion can be supported by the proposal of the Central Government to levy Estate Duty on agricultural property and to pass such Duty on to the States.

It will undoubtedly be necessary to review in certain cases the existing imposts on plantations such as Tea, Coffee, Rubber, etc., so as to prevent the industry being subjected to multiple taxation. Taking the example of Tea, there is (a) land tax, (b) Tea Cess collected on quantity basis, (c) Export Duty at four annas a lb., or an Excise Duty at the rate of three annas per lb., and the suggested Agricultural Income Tax will be a fourth item. It will obviously be necessary to examine the capacity of the industry to bear these various burdens especially bearing in mind the increasing cost of expanding labour legislation.

Question 141.—How would you determine taxable income in the comparative absence of accounts in rural areas? What treatment should, in particular, be given to the following?—

- expenses of cultivation, harvesting, preparation for the market, etc.;
- agricultural losses owing to a calamity or other reasons; (In this connection, would you favour giving the assessee the discretion to choose the alternative of averaging his income over a number of years—say 3 to 5 years—in order to cover good and bad years);
- depreciation in respect of—
 - live stock,
 - implements and carts,
 - means of irrigation, e.g., wells, etc.,
 - buildings?

In the absence of accounts, estimates would have to be made, as are at present made by the Income-Tax Officers in the case of assesseees not maintaining books. Losses should be carried forward for adjustment against subsequent profits. It may be difficult to make assessments on the basis of the average yield per year.

In addition to allowing expenses of cultivation, harvesting and preparation for the market, depreciation should be allowed on implements and carts at 20 per

cent. Live stock may be treated on a replacement basis. The cost of irrigation canals should be allowed to be written off over a period of years. Depreciation should be allowed on Buildings of substantial construction, but Cooly Lines should be dealt with on a replacement basis.

It has come to the notice of this Chamber that attempts have been made by the Income-Tax Officers in North Malabar to levy tax on a portion of the income from coffee, stated to be applicable to manufacturing operations on the analogy of levy of tax on forty per cent. of the profit from tea. This Chamber is strongly of the opinion that no manufacturing operation is involved in the curing of coffee, no mechanical processes are involved and no elaborate machinery is required for curing the coffee beans. This Chamber wishes to emphasise that the curing of coffee is an operation carried out in order to make the produce fit to be taken to the market, and there should be no question of any portion of the profit on coffee being taken as other than agricultural income. The analogy of tea is completely inapplicable to the case of coffee, and it is relevant to point out that the Madras High Court has decided that the curing of green tobacco leaves is only an agricultural operation. (See 1944, I. T. R., page 1.) The recent procedure followed by the Income-Tax Officers appears to be contrary to the observations contained in C. I. T., Madras, vs. Mathias, 1939 I.T.R., page 48.

Question 142.—What rates would you prescribe for agricultural income-tax and how would you graduate them? Is it possible to have uniform rates in all the States? What exemption limits would you lay down?

For suggested rates of Agricultural Income Tax see our answer to Questions 139 and 140 above.

PART V.—OTHER TAXES (Central and State)

Stamp Duties and Court Fees

Question 162.—Under the Constitution—

- (1) the Union is empowered to fix the rates of stamp duties in respect of bills of exchange, cheque, promissory notes, bills of lading, letters of credit, policies of insurance, transfer of shares, debentures, proxies and receipts, and
- (2) the States are empowered to fix the rates of all other stamp duties.

As regards both (1) and (2), have you any suggestions to make for the levy of a stamp duty where it is not already levied, or for an increase or decrease of the present rates where a stamp duty already exists? Please give reasons for your suggestions. Are there any general principles which you would propose for adoption in regard to the fixation of rates of stamp duties?

As regards (2), since the rates vary from State to State what degree of uniformity do you consider desirable and feasible, and how do you propose to achieve it?

If possible, please estimate the net effect of your proposals on the revenues of States.

Of the various items referred to in sub-section (1) the stamp duty now payable on transfers of shares and debentures varies from State to State as the scale of duty is linked to the scale of duty applicable to conveyances or mortgages. We consider it very necessary that in respect of these items uniformity should be obtained. As the items relate to commercial and business transactions the stamp duty should be kept as low as possible and in any case should not exceed say Rs. 5 per Rs. 1,000.

With reference to sub-paragraph 2 since stamp duties constitute a source of provincial revenue the States would like to have freedom to vary the rate from time to time. In the circumstances therefore although it is desirable it is not feasible to have any uniformity in the scales of duty for transactions other than those referred to in Question 162(1). The recent controversy over having a uniform sales tax bears this out.

We are unable to estimate how the revenues of the State will be affected by the proposals.

Question 163.—Certain States (e.g., Bombay) levy stamp duties on transactions in forward markets. What is your view regarding the complaint that these duties have tended to affect the business in these markets, particularly that of the middle class traders? If you consider that the levy of stamp duty on transactions in these markets is a suitable and potentially important means of securing revenue, what administrative and other measures would you suggest for the efficient collection of such duties? Alternatively, in place of stamp duties, would you suggest some other form of taxation of transactions in stock exchanges and futures markets? If so, please elaborate your suggestion.

We do not consider that stamp duties should be levied on transactions in forward markets. The diffi-

culty is in collecting the stamp duties. There will be considerable evasion as there will be no check over duties not paid. In the circumstances we consider that a mode of taxation for transactions in stock exchanges and futures markets should be adopted. The rate should be as low as possible and on an *ad valorem* basis.

Question 164.—In this country, the stamp duty is ordinarily a tax on documents which constitute evidence of legal rights. There are, however, certain taxes, such as the entertainments tax, which are sometimes collected in the form of stamps, and suggestions have been made that this system may be appropriately extended to the collection of taxes on the sale of goods or on other transactions. Do you agree with this view? If so, to what taxes would you extend the scheme?

We do not agree with the view that taxes on sales of goods or other transactions should be collected in the form of stamps. This procedure will lead to considerable evasion as there will be no machinery for checking transactions which are not duly stamped. In this connection it must be borne in mind that stamp duty is not like Court fees. In the latter the receiving officer sees that the proper Court Fee is paid. In the former case except in the case of registered documents where the registrar checks the stamp duty at the time of registration there is no proper check in the case of documents not requiring to be registered.

As the law stand; at present the only stage at which the stamp duty is checked will be when the documents are sought to be filed in evidence in Court. Government relies upon the penal provisions provided in the Stamp Act but the penal provisions embodied in Section 64 may not in certain circumstances be useful from the Government point of view. The parties may consider it worthwhile to risk non-payment.

Question 165.—What are the more common methods of evasion or avoidance of payment of stamp duty? What means of prevention would you suggest?

The common methods of evasion and avoidance are firstly placing a low valuation on the property. In certain transactions referred to in Articles 23, 31, 54, 55, 58 and 64 of the Indian Stamp Act stamp duty is payable on the value of the property as set forth in the instrument. If therefore a low value is inserted the stamp duty payable will be proportionately low. In our opinion this should be amended so that stamp duty may be collected on the value of the property. The word "as set forth in the instrument" should be deleted.

Another way in which stamp duty is avoided is not to carry out the transaction by means of a document. For instance a seller may receive the purchase price and place the purchaser in possession without executing a document for the purpose. After the lapse of 12 years the purchaser will acquire a good title and Government will then have been deprived of its revenue.

The reason for avoiding the stamp duty is the high rate of duty prescribed by the Act. For instance the rate of duty prescribed on bonds and mortgages is very high when compared with the duties prescribed on similar documents in England and America. This was pointed out in 1925 by the Indian Taxation Enquiry Committee. The high rate of duties also tempt persons to resort to evasion both legal and illegal.

Similarly the stamp duty payable on usufructuary mortgages is far in excess of that payable on simple mortgages. Further in respect of usufructuary mortgages the various Municipal Acts impose surcharge at the rate of 5 per cent. or 4 per cent. and the parties have been at pains to devise methods by which to avoid duties and the legislature has from time to time intervened to prevent the evasion.

Further in charging duties on *ad valorem* scale the points at which the duty increases are separated by wide margins and this work hardship on transactions of a low value. To avoid payment of higher duty parties do split up the transactions and carry them out by more than one document.

Similarly although there is not much difference between a gift and settlement, the former pays a very high duty when compared with the latter and in addition pays a surcharge under certain local municipal laws.

The stamp duty on gifts is at the rate of 3 per cent. in Madras. If however some consideration is set forth in the document then stamp duty is payable only on the value of the consideration. Often times it happens that properties meant as gift are transferred by way of conveyance for a small sum for the purpose of avoiding payment of heavy stamp duty. The only remedy is to decrease the rate of stamp duty payable on conveyances.

Question 166.—The rates of Court Fees differ from State to State. To what extent do you consider uniformity in the rates desirable and feasible?

We do not consider it feasible that Court Fee of a uniform rate should be levied by all States. Court Fee is a State revenue and the State should be at liberty to prescribe the scale as occasion arises.

Question 167.—Have you any suggestions to make regarding the schedules to the Indian Court Fees Act and the rates of levy thereunder?

We consider that the *ad valorem* scale of Court Fee prescribed by the Indian Court Fees Act is very high. In our opinion taking the Madras Scale as the standard it should be reduced by one-half. The fixed duties are not high and may remain as at present.

Taxes on Motor and other Vehicles and Entertainments Tax

Question 168 to 175.—No comments.

Tax on the Consumption or Sale of Electricity

Question 176 to 180.—It is understood that the Federation of Electricity Undertakings of India is replying to these questions.

Betting and Prize Competition Taxes

Question 181.—The betting tax is confined in practice to horse racing. Have you any suggestions to make regarding the rates of betting tax, the manner of levy of the tax, and the measures which may be adopted for minimising evasion of the tax?

(a) In order to spread the incidence of tax evenly throughout the betting community, it is desirable that the tax should be levied on the amount wagered not on the amount won.

(b) It is also desirable that the rate of tax should not exceed one anna in the rupee, i.e., 6½ per cent. and by imposing it upon all stakes wagered this is feasible without diminution in revenue.

(c) By levying the tax on the basis suggested and at a rate not in excess of that suggested, evasion of the tax "on the course" will be automatically minimised if not entirely eliminated.

VIEWS OF THE MADRAS CHAMBER OF COMMERCE, SUPPLEMENTARY TO THEIR REPLIES TO THE TAXATION ENQUIRY COMMISSION.

Copy of letter, dated 30th April 1954 from Secretary of the Chamber to the Secretary, Taxation Enquiry Commission.

During the course of the examination by the Commission on 28th April of the representatives of this Chamber, the question of the treatment for Income-Tax purposes of the additional cost of replacement of assets originally installed pre-September 1939 was discussed and we were asked to consider certain suggestions put forward by the Chairman of the Commission and to submit to you some further notes.

2. As we understand it, the suggestions are:—

(a) That the additional cost of replacement of assets installed pre-War, i.e., the difference between their present replacement cost and their original cost—might be charged against revenue in the year of replacement and the initial depreciation allowance should be foregone and the start of the ordinary depreciation allowance should be deferred for, say, five years.

(b) Alternatively, a Special Replacement Reserve should be allowed to be accumulated for specified industries of national importance.

3. We think the problem of finding finance to meet the extra cost of replacing assets installed pre-War is now universally appreciated and it is generally accepted that the rise in the cost of plant and machinery can be taken at somewhere between 2½ and 3 times the pre-War cost.

It can also, we think, be accepted that the bulk of the industrial equipment now in use in this country was installed pre-War, at some time between 1920 and 1939, so that, allowing, on an average, thirty years useful working life, the bulk of this pre-War installed equipment must, within the next few years, become due for replacement. Much of the equipment may indeed be overdue for replacement either because it has been worked two or more shifts for many years, or because some of it (in the Textile industries for instance) was installed prior to 1920. The problem therefore is becoming immediate but is not one which will continue because the present allowances for Income-Tax purposes on industrial equipment installed since 1948 are adequate to provide for funds being built up to meet its eventual replacement.

4. In our original reply to Question 61 of the Commission's Questionnaire, we put forward two alternative suggestions to meet the problem of replacement of equipment installed prior to 1st September 1939, one suggested special rates of depreciation being allowed for the next few years on such assets and the alternative was that industries should be permitted to build up, over the next few years, a Special Replacement Reserve equal to twice the original cost of such assets, with the safeguard that if a worn out pre-War installed piece of machinery is not replaced within three years of its going out of use, the amount allowed as reserve for its replacement should be taxed.

5. The suggestion made to us, that where a piece of

(d) In order to eliminate illegal betting "of the course" and consequent loss of revenue resulting from such illegal bets, it is suggested that "off the course" betting on horse racing should be legalised and that a limited number of bookmakers should be licenced to receive wagers off the course. This procedure would greatly strengthen Government's hands in dealing with illegal betting in bucket shops.

(e) Collection of tax should be at source. That is to say, Race Club officials should be responsible for the collection from the public and remittance to Government of the tax in respect of totalisator betting, and licensed bookmakers—on and off the course—should be responsible for collection of the tax from their clients and remittance to Government.

Question 182.—Do you consider it practicable to extend the betting tax to other forms of betting? To which and how?

Apart from extension to Dog Racing, if this form of entertainment is introduced into India, I do not consider it practicable to extend a betting tax to other forms of betting which in any event are illegal and should remain so.

Question 183.—Have you any suggestions to make regarding the tax on prize competitions, e.g., on crossword puzzles? To what extent is uniformity between States desirable in regard to rates, etc., and what steps would you take to bring about such uniformity? What suggestions can you make in regard to preventing evasion or avoidance to the tax?

It is suggested that a tax at the rate of one anna in the rupee should be imposed on all entrance fees collected for prize competitions, including Crossword puzzles, and that collection and remittance to Government should be the responsibility of the promoters of the competitions.

Betting and Prize Competition taxation should be uniform throughout India and therefore it is desirable that it should be provided for by Central legislation.

of its replacement over and above its original cost should be charged against the revenue of the business and at the same time the initial depreciation allowance should be given up and the ordinary depreciation allowance deferred for five years, certainly has very strong arguments in its favour, the most attractive being, in the view of this Chamber, that the amount of relief to be immediately allowed would be based on actual extra cost of replacement, as against a notional cost implied in this Chamber's original suggestion, and from the point of view of the Revenue, the calculation of whatever special allowance is to be given undoubtedly is much more welcome when based on actuals than on notional figures.

6. In effect, if this suggestion is accepted, the Revenue will be allowing immediately approximately 7 annas in the rupee on the extra cost of replacement and against this the Revenue would save itself the initial allowance of 20 per cent. and the additional allowance of say, on average, 10 per cent., that is to say, the Revenue would be saving 7 annas in the rupee on 30 per cent. of the extra capital cost. Thus, the immediate cost to the Revenue would be something in the order of 7 annas in the rupee on 70 per cent. of the extra cost.

7. In addition, the Revenue would, over the next four years, save the tax on the remaining four instalments of the additional allowance.

8. From the point of view of industry, depreciation, as this Chamber understands it, at the normal rate of say 10 per cent. would be allowed on that portion of the replacement cost of the asset represented by its original cost, i.e., on Rs. 100 as compared with the replacement cost of Rs. 300 and in the sixth year, depreciation would start to run at the normal rate on the extra cost, i.e., on the remaining Rs. 200.

9. If something on these lines could be allowed, this Chamber agrees that it would go a long way towards assisting industry over this difficult problem of finding the necessary finance to meet the extra cost of replacement.

10. The alternative suggestion, that a Special Replacement Reserve might be allowed for specified industries of national importance is closely allied to the suggestion originally put forward by this chamber in its reply to Question 61, except that our recommendations have now been qualified by the proposed limitation to industries of national importance.

11. This of course, is a new line of thought in relation to Income-Tax Legislation and, as was agreed at our meeting with you, so far as we know, Section 56A is the first time that any particular industries have been singled out in an Income-Tax Act for special treatment. In the view of this Chamber this differentiation in favour of certain specified industries is unfortunate. We think that all industry, of whatever nature, creates wealth and employment and it quite frequently happens that the so-

greatly to national and State revenues by the various special Duties and taxes imposed upon them. If this view is accepted, it must follow that any Income-Tax relief should be allowed equally to all types of industry.

12. Of the two suggestions on which we have been asked to offer our comments, it will be seen from what we have said above, that we are in favour of the first one, that on replacement of pre-War installed equipment, the

extra cost should be allowed as a charge against revenue the initial depreciation allowance being given up and the start of the ordinary allowance being deferred for five years.

In conclusion, I would like to express to the Chairman and Members of the Commission our appreciation of the very kind reception which was given to us on 28th April.

सत्यमेव जयते

MERCHANTS' CHAMBER OF U. P. (KANPUR)

REPLIES TO THE QUESTIONNAIRE OF THE TAXATION ENQUIRY COMMISSION.

PART I—THE TAX SYSTEM.

Question 1.—Tax is a share in the income of citizens which the States under their respective constitutions, laws and sanctions appropriate in order to secure the necessary means for the governance, defence and procurement of services and welfare conducive to the general interest of the communities they seek to govern. It is thus a compulsory contribution to the State from the private wealth of citizens and even from aliens subject to its jurisdiction over them for reasons of residence and/or property holdings. This contribution is enforced, for the most part, without reference to either special benefits conferred or any *quid pro quo* on individual basis. Social obligations of any individual are conditioned by the earning capacity of such an individual, the general run of the prosperity of the society of which he is a member and the manner of governance to which such a society is subject. The pivots on which modern systems of taxation revolves is social solidarity from out of which arises a sense of common social obligation of an individual to the society of which any such individual is a member. The surplus left after meeting all the needs of subsistence of a citizen and his family from the income of each citizen will thus be found the basis on which any demand could be made of him for contribution towards the maintenance of public services.

The main object of taxation should, therefore, be the procurement of necessary revenues within the capacity of each tax-payer and the sustenance of all the means of progressive production of wealth in the State without impairing in the process of tax collection any factor of production. Thus a tax is good if it brings in adequate revenue without much hardship to the tax payers and if it does not discourage productive activity. The tax mechanisms and their administrations should be designed so as to stimulate production and employment and to afford little chance and inducement for evasion or avoidance of taxes. The taxes imposed ought not to be such as cannot be abandoned or modified, from time to time in order to avoid maladjustments in economy. A tax is useless as revenue to a state if in collecting it, a considerable portion of income therefrom has to be spent.

The criterion of capacity to pay on the part of an individual citizen is obviously influenced by that citizen's wealth and earnings. Raising the standard of life of the average citizen in a progressive manner and in that process of elevating the economic condition of the masses would appear to depend upon a progressively increasing provision of goods and services by the common efforts of the community than upon the mere provision of social services by the State and the pulling down of the relatively wealthier citizens and their wealth. Provision of security and good Government and the holding and maintenance of services related thereto have been and are the primary responsibility of the State. Besides this, the creation of conditions conducive to a progressive increase in the provision of goods and services by the common efforts of the community is the secondary responsibility of the Government. Development Schemes of non-proprietary character conceived and executed by the State in the interest of the community as a whole, with the sole intention of fulfilling the secondary responsibility have, therefore, a place in the role of the State. Reduction in inequality of income and wealth within limitations will thus be found incidental to the latter of the two functions of the State and cannot be the objective of tax policy.

In view of the need for a progressive increase in the production of goods and services by the common efforts of the community, any tax policy must encourage and afford incentives to work, to save and to invest. The realisation of tax according to the capacity of each individual citizen to pay, without in that process impairing productivity, obviously throws upon the relatively wealthier and better-income citizens a burden consistent with their wealth and earnings. The projection of this principle to wilfully reduce inequalities of wealth and income in the case of India will only harm productive efforts and tend to kill incentives to work, to produce and to invest as is being witnessed these days. The wealth holdings and the income of the few on top levels in India are not such that their pulling down and redistribution on any equitable and wide basis will secure for the average citizen even a fraction of his daily needs. On the other hand productive efforts, enterprise and progress, in whatever little scale they are possible today, will stand atrophied. It is, therefore, felt that the reduction of inequalities of income and wealth should not be attempted through means of taxation, unless the aggregate production of goods and services and their stock at any time in their relation to necessities and comforts of

life in India are at least equal to the demand for them, if they are not in excess of such a demand. The use of taxation as a leveller of income and wealth is not suitable to Indian genius and inhibitions. It is more in the dissemination and practice through native education and culture of those concepts of living traditional to this country that has to bring about the use of wealth and income by those that possess, for the common good of the community considering, themselves as trustees of such wealth and income. That is one of the main reasons why Manu, the Great Indian Law Giver of all times favoured indirect taxes more than direct ones.

Estate and Death Duties have come to occupy a distinct place in the scheme of modern taxation. Their primary objective is the reduction of inequality in wealth holdings. Their use as current revenues of the State is only incidental because by their very nature they cannot form the backbone of the revenue mechanism of any State. The duration of fruitful yield from this source is obviously limited because of these duties surrendering themselves before the law of Diminishing Returns sooner than any other mechanism of taxation. These duties are in the nature of taxation of capital at the death of a person commanding its ownership. Any mechanism of direct taxation that subjects capital to tax in the process of its birth and growth should, therefore, be abandoned and losses contingent upon such abandonment in the present context of an economy, should be made good through Estate Duties that have now come to stay.

The disincentive effects of any taxation proposal will have to be carefully weighed and determined in the present context of our economy because they have been found to generate undesirable repercussions on the economic growth of society. There should always be an optimum level from time to time for the levy of taxes on profits. If the levy is lower than this optimum, revenues will suffer and at the same time load on others increases. If the rate of levy is higher than this optimum, as it is tending to become these days, complacency in enterprise sets in hampering efficiency, overlooking wastes and depriving productive mechanisms of the means whereby capital equipment can be provided and maintained. This results only in the ultimate fall of output without taking notice of consumer demand.

As regards savings, individual savings will appear to depend primarily upon the existence of surplus resources after essential expenditure including tax expenditure has been met. Incentive in the form of interest or earnings that those surpluses can bring in will result their being conserved for further use in production. The confidence that such resources will not at any time be confiscated or wasted through misuse, will canalise them into desirable productive activities. Any form of confiscatory taxation will be found to hamper accumulation of savings by denying these three essential ingredients mentioned above. Hence any Government should see that, before new burdens are imposed on an industry or enterprise, the net earnings thereof are positively in excess of its respective requirements to maintain, expand and account for progressive increase of the products it turns out.

Inflation and deflation come under the jurisdiction of the monetary policy of Government. Monetary policy in turn will appear to depend upon the trends of trade, both internal and external, the balance of payments position in respect of the country as a whole and the elasticity in the operations of financial institutions like Banks, Insurance Companies, Investment Trusts, etc. Besides, the quantum and spread of currency at any time have their own effects on inflation, and deflation. Instead of attacking inflation or deflation from these bases, taxes should not be used for countering inflationary or deflationary tendencies.

Maintenance of the external balance of economy will be found dependent on ultimate analysis, on the trend of international trade and prices. Stability of internal prices will be found in this context as a desirable feature but this again is predominantly a currency and monetary matter. In so far as protection to certain domestic industries and mutual concessions arising out of international trade agreements are concerned, taxation will be found to have been affected by them and that for this matter cannot be seriously opposed. The reverse process of holding the maintenance of external balance of the economy as an objective of taxation is to deny trade and currency their legitimate jurisdictions.

Judged from the principles so far enumerated the Indian Tax system cannot be characterised as being conducive to progressive economic development with almost every individual citizen having an urge and a part to play

therein. It seeks to tax capital in most respects and lays undue emphasis on the illusive reduction in inequalities of wealth and income ignoring in that process the primary functions of the State and the need for the provision of ever increasing supplies of goods and services.

It is common knowledge that the Indian tax system specially direct taxation hinders the growth of saving and capital accumulation. So far as corporate savings are concerned, they have dwindled in recent years under the impact of cost price inflation on the one hand and heavy taxation on the other. The pressure of incometax, high import duties on raw materials and capital goods and heavy duties on exportable items like jute manufactures, tea, vegetable oil, etc., have crippled quite considerably the earning capacity of major industries. Many of the important industries are not now making even the marginal profits necessary to be able to provide for the replacement of the existing worn out plant and machinery. A close examination of the trend of Industrial Profits would reveal that in many cases, even the provision for additional depreciation on a tax-free basis could not be made because of the poor volume of profits ploughed back. A scrutiny of the trend of profits, taxation, dividend payments and retained earnings of the industrial sector in the U.S.A. will show that the corporate taxation has been definitely lower and only recently earnings were considered ample. It has been possible to plough back large sums into business out of current earnings as the return on net investments has been much higher there than elsewhere. The rate of taxation on profits in India does not allow proper provision for depreciation and hardly leaves any margin for expansion. It is, therefore, not only extremely regressive but also a tax on capital formation and savings. It is necessary that in regard to taxation of undistributed profits, the Corporation Tax should not be levied altogether. This concession may mean an appreciable saving in the industrial sector and in all the maximum relief, including the additional depreciation allowances would be less than Rs. 15 crores annually. As against this much wanted relief, Estate Duty which will be in the nature of tax on capital at death of the holder may be depended upon for sometime to make good loss to the Exchequer from this source.

Question 2.—In India the pressure of direct taxes (Incometax) fall upon only 0.25 per cent. of the total population, 99.75 per cent. of the population being therefore, held as having no capacity to pay any direct

tax in terms of their income. A fair share of indirect taxes is also borne by the same group because of its varied consumption. Rural population hardly contributes anything by way of direct and indirect taxes excepting land revenue which is an inelastic source of revenue. The pressure of almost all taxation will thus be found to fall mostly upon urban dwellers. In this context the Indian Tax system cannot be characterised as being governed by the principles of equity. Inequity of the Indian tax system has developed into an unavoidable evil in the context of our both undeveloped economy and modern ideas of Government. In order to secure equity in the Indian tax system, certain basic principles, touching upon the administration of Public Finance and determined as applicable to underdeveloped countries, hold good for application. These are (1) the State Government's Budget as well as that of the Centre if it can be so helped, must be kept small, (2) it must be kept balanced, (3) the pressure of taxation therein should be more on consumption than on savings, (4) if deficits cannot be avoided, then the scope for raising the revenue necessary to bridge the gap between the estimated revenue and budgetted expenditure and also capital deficits should be sought only in the issue of long terms bonds, (5) all borrowings except floating debts and ways and means advances must be only for productive investments, unproductive investments and all other recurring expenditure being met solely out of revenues.

Question 3 and 4.—Injudicious extension of the principle of ability to pay and the application of taxable capacity only to a particular section or sections of community have given place to maladjustments not only in our productive efforts but also in the political and economic arena. In an authentic study carried out on this subject recently it was shown that whereas the 'lower class' population at 87.6 per cent. of the total population of India contributed only 13.67 per cent. of the total tax revenue, "the upper and middle class" population at 12.4 per cent. of the total population contributed as high as 86.33 per cent. of total tax revenue in this country. The same study also revealed that the contribution of revenue from taxation mostly came from the urban areas. Looking at the per capita contribution classwise it was found that the incidence on each earner was almost hundred times more in the case of upper class as compared to lower class. The following table fully illustrates the position:

	Population in Provinces			Contribution to tax revenues		Per capita contribution	
	In millions.	As a percentage to total.	Earners in millions.	Rs. in lakh.	As a percentage to total.	By population.	By earner.
						Rs. as. p.	Rs. as. p.
Lower class	213	87.6	85.2	63,75.89	13.69	2 15 10	7 7 7
Upper or Middle class	30	12.4	6.0	402,48.83	86.33	134 2 7	670 12 11
TOTAL	243	100.0	..	466,24.72	100.00

It is evident that attempts at garnering the same number of rupees from the same sources are still on without little thought of the fact that we are heading towards economic insolvency. We have to modernise our tax revenues before we modernise our Governmental expenditure. It is also clear that the lower class man cannot contribute in any appreciable measure the increasing resources necessary for the upkeep of administration as it is being conceived and executed every day in India since his means are low. Government had been turning their attention rather ruthlessly to the man in the upper class. This the Government could do with the help of political power resulting from adult franchise in India whereunder out of an electorate of 121 millions, only about 8 lakhs of individuals pay direct taxes and 99.5 per cent. of the electorate contributes only 20 per cent. of the indirect taxes thus enjoying 700 per cent. political power without paying taxes as compared to the taxpaying sector of the population. But it is forgotten that the inexorable laws of economics are bound to operate and the law of Diminishing Returns has already set in. The contribution exacted from the upper class men inordinate and yet there seems to be no relief for the lower class men.

Question 5.—The proportion of tax revenue to national income in India is relatively small as compared with several other countries. But that does not indicate that there is yet any taxable capacity in the country left to be exploited and that as a consequence thereof there is any scope to raise this proportion. This National Income must be correlated to the National population and area in each case before the proportion of tax revenue in each case can be viewed in its correct perspective.

This apart the economic development and productivity behind the national income in each case have to be taken into account, before the proportions of tax revenue to national incomes and their trends are considered. For the potential resources, large area and the huge population that India has, her national income at about Rs. 9,000 crores a year must be considered very poor indeed. While the aggregate national income of India may work appreciably more than Canada or very near the U.K., the per capita national income is too poor to compare with any civilised country. Per capita income in India is 1/9th that of Norway, 1/11th that of Australia, 1/13th that of U.K., 1/21st that of Canada and 1/36th that of U.S.A. With the very small per capita income in India the content and quality of personal expenditures in India is largely essential and any measure of taxation to secure public revenues dependant upon predetermined and rigid public expenditure is to deprive personal consumption expenditure even on necessities. The Indian tax system must be made to depend upon national savings resulting out of the deduction of national personal expenditures from the national income and not on mere national income. In fact there is the case in India for cutting out most of the existing taxes in order to provide incentives to save, to produce more and to profitably canalise savings into further production.

Question 6.—No. All direct taxes, and specially taxes on income, affecting as they do only certain sectors of economy and not the entire community have far reaching consequences on the economic development of society should the section of the society that they affect loose the

urge to earn more. This is particularly so in the case of society where those that pay direct taxes are in very small proportion to the community as a whole. In the U.K. about 44 per cent. of the population pay incometax, in the U.S.A. about 37 per cent., in Australia about 34 per cent. The income tax paying population as already indicated forms only 0.25 per cent. of the population of India. When it is remembered that income tax makes up as much as 45 per cent. of the total revenues, it will be realised how heavy is the incidence of this tax on an insignificant minority and how a vast majority to the tune of 99.75 per cent. of the population remain untouched at least to the extent of 45 per cent. of the revenue. Fixture of proportions between direct and indirect taxes on the balance of revenues and the orthodox notion of dividing revenue collections as between direct and indirect taxes at fifty fifty can have no application to India in the above context. Considerable relief in direct taxes at last until such time as we achieve alround progress and direct taxes can become broadbased and the increasing exploitation of indirect taxes as the source of revenue are called for in the present circumstances of our economy.

Question 7.—Yes. All State enterprises including productive works should be able to pay more than the expenditure involved in their operations and maintenance if they are all run purely on business scale. Railways, Defence installations and such other national monopoly items should also be able to show appreciable surpluses on their operations through sound management thereof.

Question 8.—Yes.

Question 9.—No. Cesses once initiated take ultimately the form of excise exactions. Further levy of cesses for specific purposes militates against the principle that no fiscal receipts in the public exchequer should be earmarked as a rule for any specific purpose. This apart cesses impose unduly heavy burden on one sector when that sector has also equal claim with the others to progress without having to pay any special price for the same.

Question 10.—The inexperience of Government unsuitability of available machinery and bureaucratic outlook have been responsible for the injudicious application of capital and efforts and waste of public finance in so far as almost all State undertakings are concerned. These factors and the increase in the cost of administration have indirectly added to our burden of taxation. Government undertakings must be made to function as private commercial bodies with the applicability to State enterprises of accounting methods, computation of costs, depreciation allowances, taxes on profits, subjectivity to industrial and commercial laws and the control and regulation of Industries Act, etc., as they are applicable to private enterprise. Above all it should be possible for every citizen to know clearly and without any expert advice the method of working of any state enterprise and to judge if it has been helpful to public revenues as private enterprise. Pricing policies and limitations on profits as are applicable to public utility undertakings run under Government authorisation and monopoly conditions must hold good in the case of almost all State undertakings.

Question 11.—Surpluses earned after earmarking for depreciation and various reserves as a very sound private concern would do should be credited to a fund specifically got up to finance projects of development. Expansion of undertakings and reinvestments needs thereof must be met from this fund. No project of development should have anything to do with the revenue budgets of Governments.

Question 12.—Income and occupation are the two factors that should be the basis of differentiation in examining the incidence of taxation on various classes of people.

Question 13.—(a) No. Please see explanations in answers already given.

(b) No. The burden of tax revenue is greater in certain States when the same is viewed in terms of the population thereof. Neogy Commission would not have been necessary to consider and decide upon the division of revenue had fair distribution between different States been there.

Question 14.—Yes. The incidence of taxation, both direct and indirect, is relatively greater on persons engaged in industry and commerce and in urban areas than on persons engaged in agricultural and allied occupations and in rural areas. The shift in income has been more towards the latter class of persons, the former being soaked almost dry by taxation and inflation.

Question 15.—Yes. Specially in connection with income tax in direct taxation and sales tax in the indirect taxation. The law in both respects has become so complicated and administrations thereof have become so complex that any assessee with a fair income or turnover to account for is obliged to maintain not only experts to

comply with the provisions of law and orders passed by the authorities but also a departmental set-up in full.

Question 16.—No. the benefits accruing from public expenditure to different classes of persons have no relation to the burden of taxation on those persons nor the tax-levying authority takes into consideration such benefits while imposing taxes. Tax is levied in relation to the income of the people regardless of the advantages derived from expenditure by the Government.

Question 17.—See answer to Q. 14.

Question 18.—Development programme of the country in public sector should be based on the possibility of causing savings and harnessing them through Government borrowing. Taxation should in no case be used for financing development programme in the existing economic set-up of India.

Question 19.—Development of non-tax revenues, economy and rationalisation in expenditure and prevention of tax avoidance and tax evasion should play their part in the order stated above in maximising the resources required for the financing of development. Higher rates of existing taxes and fresh taxes should not have any place in financing development programme.

Question 20.—The Tax policy of the state should be so designed as to encourage savings, which in turn could be canalised for financing the development schemes in both the private and public sectors. It is evident from the figures of the American Treasury Receipts that when reductions were effected successively in surtax rates in respect of taxation on income, not only the number of persons reporting to incometax had increased but also the net tax collections in dollars from such persons were about fivefold within eight years. Our tax policy should aim at covering a wide range of the population by measures of taxation as has already been indicated.

If the tax policy is such as will encourage investments and endanger in the least of such investments being subjected to confiscatory assessments or legislation, quite a good deal of the finance required for development programmes might come out of foreign resources also, in addition to the hidden resources within the country.

Question 21.—See answers to Question No. 20 and Question No. 1.

Question 22.—In the recent past the rate of private capital formation has actually been lower due to a variety of reasons. The most important factor which is responsible for the lack of investment incentive in the private as well as public sectors is the harassing and cumbersome procedure adopted by the incometax authorities in instituting enquiries from investors regarding the sources of capital invested by the individual. Instances are on record where firms which started on borrowed capital had been forced to close down because they failed to satisfy the incometax authorities about the source of their investments in the manner of prescriptions laid down by the authorities and accordingly they were taxed not on the income of the concern but on the initial investment thereof. Further, the prevailing recession in prices of manufactured products accompanied by buyers' resistance and uncertainty of markets consequent upon the decline in the internal as well as the external demand and the mounting expenditure on industrial production due to the enforcement of various social security legislations have reduced considerably the scope for industrial profits. All these factors have, therefore, helped in discouraging capital formation. In support of the view that the rate of private capital formation has been lower, it may be pointed out that during the year 1952 consent was given to 254 companies to issue capital amounting to Rs. 39.8 crores under the Capital Issues Control Act as against consent for 343 companies given during the year 1951 for a total capital issue of Rs. 59.6 crores.

(ii) Yes. High Cost of living consequent upon inflation has not provided any scope to savings to wage and salaried earning classes in the lower and middle class strata insofar as individuals are concerned. The parsimony shown by the taxation authorities in the matter of Depreciation Allowances and Replacement Costs and the levels at which corporate profits are taxed leave little with Corporations by way of effective savings and their appropriate canalisation. Social security measures such as Employees Provident Fund Schemes, etc., take away into public sector even the little savings that could be shown by Corporations for use in private sector. Institutional Investments by Banking and Insurance Companies are hemmed in by restrictions and almost all these Companies can offer is diverted into the absorption of loan issues and Governmental borrowings with little incentives left for better and more profitable investments and returns.

Question 23.—In view of the fact that persons in the middle income group regard their savings mostly as a provision for the rainy day and in view of the fact

that there are no social security benefits as invalid allowances, widows' pensions, unemployment benefits, childrens' endowments, etc., which are in operation in foreign countries such as U. S. A., the U. K. or Australia etc., every one in India has almost to depend upon his own savings. Accordingly, any tax relief granted to persons in the middle class group will really encourage savings rather than adding to the consumption expenditure. As persons in the middle income group will not very much be effected by death duties for the present, tax relief in respect of direct taxation insofar as they are concerned may help them to save and to invest.

Question 24.—In the first place the Central Government should announce that additional output as envisaged by the Planning Commission after 1956-57, will, if canalised into productive investments, be free from crushing weight of direct taxation such as incometax for a substantial period. Even with this announcements and the implementation thereof, it will be difficult to realise the target of 50 per cent. of additional output going to investments each year after 1956-57 because we would have reached a stage in the supply of commodities and services by then only to 1939 standard.

Question 25.—As has already been mentioned above, in answer to Question 23, Indians for the most part are instinctively and traditionally inclined to save as much as possible for the purposes of meeting conventional necessities and security needs. Consumption standards as are conceived abroad are practically unknown here in India. For the most part the country is on the subsistence level. Persons on top income groups, say beyond Rs. 6,000 a year standard, form a very small proportion of the population of India, perhaps 0.013 per cent. The elasticity for variation in consumption standards are, therefore, absent. As is well known, savings of the poor and middle classes used to be canalised in dead savings in the form of gold and silver and ornaments. But now with the development of credit institutions and stock and share markets, the channels for investments have become diverse. Financial institutions such as banking and insurance companies should also be capable of attracting a good deal of the savings of the people. Accordingly, it is suggested that the tax policy of the Government should be so formulated as to ensure persuasive incentives and a high degree of safety to savings and investments.

Question 26.—The tax policy of the State is payable of playing a vital part in the productive system of the country. All direct taxes on production such as sales tax, terminal tax and octroi charges and excises and cesses on industrial raw materials and manufactured goods, etc., affect the cost and structure and the price of commodities by imparting rigidity to them. The impact of these levies is felt by the producers more when the market turns to be a buyers' one and consumers resistance is offered to supplies and output. Similarly indirect taxes also affect production.

The multiplicity of taxes in India in respect of the same commodity especially salestax and its lack of uniformity, affects production adversely. For instance, imposition of varying rates of salestax on the same commodities in different States induces the consumers in one States to draw their requirements from the States where the rates of salestax are the lowest by indulging in evasion and misreporting. This in turn stimulates the production in such States where natural factors do not warrant such activities. Again, the lack of uniformity in octroi charges and terminal taxes hampers production to a great extent and often leads to the migration of trade and industry from the place where these charges are high to places where they are low. The uniformity of taxes, both indirect and direct, will stimulate production in the States on an equitable basis and will encourage adherence to economic location of industries in a more natural manner.

Question 27.—The judicious use of tax system in order to secure priorities in the development programme in private sector will yield appreciably good results. Conservation and flow of capital, easy procurement of capital goods at the least possible cost, freedom of raw materials used by industries from taxation, elasticity in the application of taxation measures affecting commodities such as excise duties and salestax should be some of the basic considerations in shaping and exploiting the taxation system for the procurement of priorities for the development programme.

Question 28.—Answer to this question has been given in parts at various places in the foregoing answers. A tax policy cannot be taken as a static phenomena. It is a dynamic and evolutionary development consistent with the economic progress, potential resources and productivity of the community. The limitations and possibilities of tax policy as an instrument of economic development can be judged only in the context of political institutions on which the community seeks to depend. Ideals of democracy and freedom of the individual can-

not march together with a regulated economy and communism. In so far as 'mixed economy' which we are experimenting in India at the moment only confines itself to the embrace by the public sector of Defence and Defence strategic industries and public utilities, leaving most forms of economic activity to the private sector, the functions of the State should not be allowed to make inroads into the economy in private sector unless under a state of emergency or War. In the circumstance explained above tax policy will confine itself very much to the primary functions of the State, leaving economic development to fashion according to the genius of the community and providing adequate and necessary incentives from time to time for such economic development. What according to some, is being done at the moment in India, is the dependance on the possibilities of tax policy as instrument of development without realising the grave limitations of the tax policy in shaping economic development.

Overall demand in a community will be found to depend on ultimate analysis on the income of the community and the resources it has to gather that income. These touch upon productivity both individual and national. Tax policy by itself cannot influence overall demand in any appreciable manner. Maladjustments in overall demand that may develop from time to time in the economy of the community may, however, be considerably corrected by a judicious tax policy and its administration.

Reduction in consumption and unessential investments are influenced more by the availability of purchasing power, native habits, inhibitions and conventions and the state of economic prosperity. In a country like India where a substantial majority still live under sub-human standards this is not a problem that calls for any attention. Tax policy, it is afraid, cannot do much here so far as India is concerned. Tax policy can certainly help economic development at the moment by affording positive inducements for desirable investments. Investments are shy and halted at the moment because savings are discouraged by the present tax policy and administration. There is considerable scope for action here. The use of tax policy to effect redistribution of incomes so that economic development may be broadbased with the participation therein of as many as possible would have merited attention, had we in this country the know-hows and equipment combined with individual productivity upto a certain minimum standard. Any attempt at redistribution of incomes through tax policy in India at the moment will only lead to the impoverishment of the insignificant minority of well-to-do without in any way bettering the condition of 99.75 per cent. of the teeming Indian population. There is the additional danger of destroying in this process whatever little 'knowhows' and equipment we have natively rooted in India at the moment.

Question 29.—In so far as monetary policy is concerned certain controls as instruments of planned economic development may be thought of. To thinking of controls in the same breath with tax policy will be found incompatible with economic development under democratic conditions. Tax policy must have nothing to do with controls in any shape or form.

Question 30.—The present tax system in India more than makes for a reduction in inequalities of wealth and income and this feature of tax system has not helped the poor in improving their lot while it has destroyed the utility of the rich to the community.

Question 31.—With the enactment of the Estate Duty Act, we have provided for securing a large degree of economic equality. Estate Duty, having grave limitations as a revenue counter with regard to both time and quantum factors in a country whose overall exploited wealth is poor, should be capable of being used as a substitute for losses arising out of reliefs extended in direct taxation and modifications made in indirect taxation in order to provide effective incentives to capital formation and higher production.

Question 32.—Public expenditure may be more effectively and judiciously used in achieving greater measure of equality of income than the tax system.

Question 33.—See relevant answers under the heading 'Incometax'. Foreign capital flowing into India in the form of capital goods and technical skill unavailable in India might be let off with a relatively lower pressure and burden of taxation as compared to foreign capital migrating into India for trade, banking and insurance purposes. Similarly ample scope may usefully be extended to the exploitation by foreign capital in India of secrets and patents of foreign origin with materials available in India over a period of years with an eye on the development of India's export markets and scientific research such exploitation will give place to. The judicious use of tax system by timely adjustment of commodity taxes (indirect) and direct taxes offers sufficient potentials towards this end.

Question 34.—Succession and Estate Duties on all properties other than agricultural land as revenue counters are hemmed in by grave limitations both in respect of time and yield in a poor country like India where those capable of responding to such duties are concentrated in urban areas and are very few and far between. If economic development takes place rapidly from now on the beneficiaries of this development for the most part will be the lower and middle income groups rather than the wealthy because of the changing concept of ranks and social order. A forecast of better returns from Death and Succession Duties cannot, therefore, be made even if the potentials for economic development are taken into consideration. Terminal taxes on goods or passengers carried by Railway, sea or air are at best an extension of the principles of octroi levies and serve merely as a source of local finance irrespective of by whom and where they are collected. When it is realised that a terminal tax is in the nature of an octroi without refunds adversely affecting inter-state trade and that the rate of levy of this tax should be very low in all cases, the potential of this tax as a source of revenue is left in doubt. Further salestax and excises, which already impose burden on commodities and indirectly on persons consuming them, leave little justification for the levy of terminal tax. Taxes on railway freights and fares will again be found as having very limited scope for exploitation and they are no more than an enhancement of railway freights and rates. There is no elasticity in this form of tax. Industries and commerce which contribute towards railway freight. For the most part and third class passengers who contribute towards railway fares for the most part are apt to resent against such levies in the present economic context. Taxes on transactions in stock exchanges and other future markets though capable of yielding limited revenue and very much more for certain States as compared to almost nothing for some states in India are worthy of consideration. Since the tax does not impose any burden on productivity and effective economic efforts, it could be levied until the Law of Diminishing Returns sets to operate in respect of this tax. Taxes on sale or purchase of newspapers and on advertisements published therein are dealt with in Answer to Q. 126 following.

Question 35.—Taxes on capital do not offer any scope for exploitation as taxes on income already impose heavy burdens and savings and capital formation are almost becoming impossible. Instead of progressive economic development for which we are planning, we will be found to be administering regressive economy if we start imposing taxes on capital. Estate duty is itself a tax on capital at one stage of its existence and any further scheme of taxation of capital in the process of its formation has least justification.

The myth of salt duty affecting the poor and sentimental considerations attached to the levy of this duty must be given up. Even without salt duty, salt does not figure as any free item or item of lesser burden to the poor. Its consumption will always be limited. Further the principle that every citizen ought to contribute his mite to the State and the fact that in a poor country like India where the expansion of direct taxation any further is impossible and all the forms of indirect taxation do not touch all universally offer sufficient justification for the reintroduction of salt duty to make up for the revenue of the State.

Land revenue having almost been static all these years despite better prices obtained for agricultural commodities over the last few years and with the reform of land tenure system offers scope for better exploitation. Surcharges will be found conducive to revenue accretions of the States. The biggest obstacle here will be the political consideration of a vast majority of agricultural population having franchise rights. A 25 per cent. increase in land revenue could be easily accounted for from this source. Betterment levies and agricultural incometax offer considerable scope for revenues of the States especially in the context of the development schemes undertaken in rural areas. But here again political considerations may prevent our exploiting the resources to the limits of their possible yields.

Policy of prohibition has clearly been a failure occasioning at the same time considerable loss of revenue to the States. Here again sentiments rather than hard facts of economics have been the chief consideration. A considerable loss of revenue occasioned by the policy of prohibition to gain a mythical national advantage could be avoided by scrapping this policy. Provincial excise which is in fact intended to discourage consumption could be attuned from time to time and fixed at levels where revenue will not only come in but will at the same time discourage anyone from becoming addict to alcohol and drugs.

Question 36.—Yes. The process of levy basis for assessment and the points at which the levy can be justifiably imposed must be carefully considered when deciding upon taxing unearned increments in value of

land and other property as a result of public projects of development.

Question 37.—Integrity, a sense of human touch about enquiries and dealings and a sense of awareness to realities rather than legalistic interpretation of relevant Acts and Rules and an attitude of ruthlessness in assessing and collecting taxes on the part of the taxation machinery will keep tax evasion at the minimum. The removal of burdens of direct taxation to a point that can be borne safely by the assessee without endangering his capital will also account for a considerable abatement in ingenuity employed to escape taxation altogether and to indulge in evasions. Public relations' work on behalf of the assessing and collecting machinery among assessee to tax and exhortation by men of influence to adhere to the obligations imposed on citizens by example and precept will also account for increasing receipts from existing sources of revenue. These considerations apart, it will be observed that irksomeness and harassment caused by any one taxation measure or control mechanism have their own repercussions on anyone properly accounting for resources, their use, and earnings with the result that most money is made and many transactions are put through out of account making assessments and collections of taxes impossible. These adverse repercussions on productive efforts being accounted for must be avoided if receipts from the existing sources of revenue are to be stepped up.

Question 38.—We cannot recommend any new sources of taxation in the present state of our economic development.

Question 39.—As a rule the imposition of surcharges on any indirect tax must be avoided. Even in the case of direct taxes on which the impositions of surcharges are thought of consideration must be had for factors such as the possibility for overall revenue shrinking the burdens that such impositions might cast on the payer or the class of payers of the tax concerned. Judged from these standards, Incometax and supertax surcharges appear inopportune and undesirable at the moment. Surcharges on subjects covered by Article 269 of the Constitution of India should always be out of question for most of them are themselves surcharges on prices of goods and services concerned.

Question 40.—Please see answers to question 1 *supra*. Inflationary or deflationary situation arise out of factors governing currency and banking and the nature of cost structure for the time being in both industrial and agricultural sectors. Tax policy as an instrument for dealing with such situations offers little or no scope in India. India is a country where the population lives on an exceedingly low standard of living and in which the ratio of unused resources to population is very high. We can, therefore, anticipate a rapid improvements in living conditions as the utilisation of resources progresses. The impact of new investments upon living standards can be both rapid and significant if the rate of population growth does not continue as at present. To the extent, therefore, of attracting new investments, a sound tax policy may assist upto a certain point. If taxation is used to soak the few well-to-do under the illusion of creating a new social order and public sector spills forth such revenue collections in social or security services, the result in the absence of balanced development in India yet, will be the creation of inflationary conditions where too much money will be found chasing too few goods necessitating all sorts of economic controls. Example of such a development is provided by the happenings during the second World War in the economic sector of India. The inherent weakness in any tax policy is that once it is set in motion its withdrawal is found to bristle with difficulties to the extent of making withdrawals and even abatements impossible. A tax policy cannot, therefore, be expected to bring about the deflationary situations easily. It is the state policy rather than tax policy that will be found to have any bearing on inflationary or deflationary conditions.

Question 41.—Just as inflationary condition is the symptom of the availability of goods and services below the overall availability of purchasing power deflationary condition is the symptom of scarce availability purchasing power in relation to the supplies of commodities and services at any given time. It is the extent to which cost structure in agriculture and industries enjoy resilience and offer scope for adjustments supply of goods and services will automatically adjust themselves to the demand for them and *vice-versa*. At the moment direct taxes in India touch an infinitesimal fraction of the population and that too at upper levels. The taxation on income at the top most level during the War did not relieve that period of inflation because of this main feature of indirect tax in India. Consumption cannot be restricted by direct taxation unless such taxation embraces a sizeable proportion of the population. Mere relief in direct taxation at the time of deflation does not help very much either because direct taxation influences the cost structure only remotely and indirectly.

The time lag necessary for adjustments in production, supplies and consumption under either deflationary or inflationary conditions is beyond the purview of taxation and hence direct taxes cannot be depended upon to correct currency and credit maladjustments. All indirect taxes do influence prices directly and a few of these costs also to a considerable extent. To the extent, therefore, prices have a bearing on consumption indirect taxes certainly help in countering inflationary or deflationary conditions. But to depend on these taxes alone to counter the inflationary or deflationary conditions is to place more than reasonable reliance on tax mechanism as correctness of inflationary or deflationary situations. The element of tax in cost structure these days is considerable enough to influence prices. To the limited extent, therefore, all indirect taxes such as excise duties and sales tax can be depended upon as correctives to ill-developed monetary situations. Adjustments in import and export duties do stimulate or stifle consumption to a certain extent but with so many restrictions and exports in operation in international trade, their influence is not so much as it had been in the past before the World War II.

Question 42.—Please see answers to Questions 40 and 41.

Question 43.—In practice Government sponsored centrally conceived plans of economic development frequently result in sustained inflationary pressures because of the release of resources it engenders in activities having socio-economic significance as against activities involving purely production and productivity. Economic development does not lean on the free play of economic forces. The result is disequilibrium in the structure of currency and credit. With all the Government resources yoked to the execution of the plan and in spite of absorption of all available resources in the country through taxation and loans there is still unemployment, underemployment and deflation. It is, therefore, clear that in order to bring about automatic and timely adjustments in economic disequilibrium such as inflation or deflation, Government financing should not be allowed to have ramifications beyond Government's primary responsibilities. It must be clearly understood that neither Government actions nor Government funds are satisfactory substitutes for private actions and private funds under a democratic climate.

Question 44.—Please see answer to Question 41

Question 45.—Please see answer to Questions 40, 41 and 43.

PART II—DIRECT TAXES INCOME-TAX

Question 46.—Provisions of Section 4A determining the question of residence of an assessee do not require any change but the provisions contained in Section 4B are useless. Section 4B was enacted only for the benefit of Europeans coming for service in this country. The Income-tax Investigation Commission also recommended the abolition of the term 'not ordinarily resident' vide para. 36 of its Report.

Question 47.—Section 2(6C) deals with the term 'income'. It does not attempt to give any definition of the word income but simply says that the word 'income' will include (1) dividend as defined in clause (6A) or (2) perquisites as mentioned in sub-section (1) of Section 7 namely a payment due to or received by an assessee from an employer or former employer or from a provident or other fund exclusive of contributions made by the assessee or interest on such contributions, excepting a payment made solely as compensation for loss of employment and not by way of remuneration for past services or (3) any sum deemed to be profits under the second proviso to clause (vii) of sub-section (2) of Section 10, i.e., when on the sale of any building, machinery or plant, the sale price exceeds the written down value, the difference between the original cost and the written down value is deemed to be the profits of the previous year in which the sale took place or (4) any capital gain chargeable to income-tax under the provisions of Section 12B which is no longer in force, or (5) any business of insurance carried on by a mutual insurance association computed in accordance with Rule 9 in the Schedule annexed to the Act.

These items had to be specified because otherwise they would not have fallen in the definition of 'income'. The definition of 'income' has been laid down in judicial pronouncements but the word 'income' as such has not been defined anywhere and in fact it is very difficult to give an exhaustive definition of this word. Even in other countries the word has not been suitably defined and reliance is placed mostly on judicial pronouncements. One of the authoritative definitions given in a leading case is as under :—

“‘income’ in this Act connotes a periodical monetary return coming in with some sort of regularity, or expected regularity, from definite sources. The source is not necessarily one which is expected to be con-

tinuously productive, but it must be one whose object is the production of a definite return, excluding anything in the nature of a mere windfall.”

(Commissioner of Income-tax Vs. Shah Wallace and Company).

The principle enunciated above should be adhered to in the connotation of the word 'income' so that any attempt of roping in income of casual and non-recurring nature of capital gains may be avoided. Appreciation in the value of machinery is obviously a capital gain and should not be included in the word 'income'. Moreover it is unfair to assess this capital gain in view of the fact that the replacement cost of the machinery to-day is 4 or 5 times the original cost of the machinery. The industry needs funds for replacement of worn out machinery. It is therefore, suggested that Section 2(6C) should be amended accordingly and the second and third provisos to Section 10(2)(vii) should be deleted.

The definition of the word 'business' in section 2 (4) which includes any trade, commerce or manufacture or any adventure or concern in the nature of trade, commerce or manufacture has been invoked in numerous cases for assessing what is nothing more than the casual income or capital gain. The Income-tax Act should confine itself only to taxation of income and now that the Estate Duty has been introduced any increase in wealth due to casual and non-recurring gain or by appreciation in the value of property would be automatically taxed at the time of the owner's death. In the recent Bombay Case of Rajputana Textile (Agencies) Ltd. Vs. Commissioner of Income-tax (XXIV IPR-46), the sale of a block of shares by the company was held to be an adventure in the nature of trade although according to its Memorandum and Articles of Association, the Company was not authorised to deal in shares. Simply because several brokers were engaged to dispose of the shares, it was held that the transaction constituted an adventure in the nature of trade and commerce. It was not possible to dispose of a large block of shares without the help of brokers and as such the definition of the word 'business' in Section 2(4) should also be amended.

The inclusions made in Section 2(6C) should all be dropped from the definition of the word 'income' except any business of insurance carried on by a mutual insurance association.

Question 48.—Taxing of capital gains would, it is apprehended, seriously jeopardise the economy of the country. During the war period there may be very great fluctuations in the value of all property and if capital gains are to be included in the assessment, capital losses will also have to be accounted for and deducted out of the income. This will make the position administratively difficult without any appreciable gain to the revenue. Now that the Estate Duty is going to be introduced, the capital gains, if any, would be automatically taxed to Estate Duty on the death of the last holder of the property and this is where the matter should be left finally. As already noted above any excess realisation over the written down value of building and machinery on the sale thereof should not be taxed.

Question 49.—Have you any comments on the present position re: taxation of profits which accrue or arise abroad, on their repatriation to India?

The present position regarding taxation of foreign profits is as follows. So far as pre-1939 foreign profits are concerned, they were till recently liable to duty on being remitted to India. But certain concessions have now been granted by Government (Vide Press Note of Government of India dated the 2nd September, 1951). Those profits are now exempted on remittance if—

- (1) the remittance is received in India before 1st of April, 1954,
- (2) half the amount receipt is invested within three months of the receipt in the purchase of Government securities through the Reserve Bank of India, and kept with the Bank for a minimum period of two years, and
- (3) the remaining half is utilised in the discharge of any outstanding income-tax liability.

As for foreign profits earned subsequent to 1939 they are fully taxed in the year in which they accrue. The foreign income is added to the total income of the assessee and he is taxed on his total world income.

Regarding Indians living abroad who are desirous of returning to India, the Income-tax (Amendment) Act, 1952, provides for exemption from taxation of foreign profits which are remitted to India by such non-resident persons in the first two years of their becoming resident in India. Such contingencies are very real, as restrictions on remittances are imposed by foreign States like Ceylon, Burma, Pakistan, etc. The Provision should, therefore, be amended by extending the time limit to cover such contingencies.

The Committee suggest that foreign profits should be completely exempt from tax, though they might be taken into consideration only for the purpose of determining the rate of tax on Indian income so as to conform to the principle of ability to pay. By the Income-tax (Amendment) Act, 1952, the full amount of the foreign tax or the Indian tax on the foreign income whichever is less is deducted from the total Indian Income-tax payable. This unilateral relief is no doubt good so far as it goes, but the Committee submit that it will be only taking a small step forward if their suggestion that foreign profits should be exempted altogether from the tax taking them into consideration only for rate purposes is adopted. This will facilitate and give a fillip to the expansion of Indian trade and business abroad and will also give them capacity to compete in the world markets. Moreover, foreign income and Indian Income cannot be put on the same basis for the purpose of taxation as the risks and dangers involved in risk capital venturing out are far greater than when it is invested in India. The economic justification to tax foreign earnings is comparatively weaker than to tax Indian profits. Another aspect is that the earning of foreign profits by Indian residents will considerably help Government in its exchange resources. As already indicated the exemption of foreign profits is not likely to result in much loss to the Exchequer as unilateral exemption upto 100 per cent. of the foreign tax or the Indian tax whichever is less is being granted even now. If an attempt is made the Committee have no doubt that the loss to the Exchequer will be found to be negligible, whereas the psychological effect that the exemption of foreign profits will give to our developing trade and business abroad and to our increasing invisible exports will be very valuable indeed. Such funds when remitted to India will add to the capital resources of the country.

Both in the United Kingdom and U. S. A. there is a trend towards exemption or relief for foreign profits. There is greater justification for such relief being extended in India because, on taking overall picture, it will appear that if the world income taxation concept is abolished throughout, the automatic result will be the extinction of the Double Taxation Relief arrangements. As it is, in respect of most countries, India would be the worse off by having Double Taxation Relief arrangements and that is the reason why such relief arrangements existing before independence stand terminated.

Question 50.—The definition of the term 'dividend' given in Section 2(6A) needs no change. Distribution of Bonus shares cannot be treated as dividend as there is no release of assets in such cases. The price of a share in the open market reflects the full value of the assets of the company modified to some extent by its earning capacity and distribution of dividends in the past. By the issue of Bonus shares the value of each share is reduced considerably and consequently if the nominal value of Bonus shares is treated as dividend, the loss on existing shares will have to be taken into account. No change, therefore, is necessary in section 2(6A).

Question 51.—Do the provisions of the Income-tax Act relating to the taxability of non-residents through their business connections in India in respect of income deemed to accrue or arise within the taxable territories (Sections 42 and 43 of the Income-tax Act) affect adversely the interests of persons engaged in foreign trade? If so what modification would you suggest in these sections?

Yes, the interpretation now being placed on these sections very materially affects the interests of persons trading with but not in India and is becoming a strong impediment to the development of that trade in the absence of tax treaty arrangements or Double Income-tax Avoidance Agreements with other countries, particularly the U. K. For instance, Income-tax Officers here are seeking to raise assessments on concerns in India as agents for non-residents. Again, non-residents manufacturing goods outside India, selling them outside India to residents in India and then shipping the goods to India and forwarding documents to a Bank in India for the Bank to collect the sale proceeds on behalf of the non-residents and deliver the documents to the buyer when payment has been received are faced with the contention that this constitutes receipt of the proceeds which includes the profits in India by or on behalf of the non-residents and that therefore the whole profit is assessable in India.

There is a considerable amount of case law on this question to which the Chambers and other organisations represented on the U. P. Ad Hoc Committee would invite the Commission's attention, such as Civil Appeal No. 41 of 1952, M/s. Turner Morrison & Co. Ltd. Vs. Commissioner of Income-tax, West Bengal. These cases, and the earlier ones referred to therein, exemplify the range of commodities forming an important part of India's international trade which stands to be affected most adversely by the current interpretation of Section 42 and 43—Tea, Wool, Salt, Shellac to mention a few. With regard to the mere purchase of goods in India and other

acts which have been held to constitute operations carried out in India for profit by or on behalf of a non-resident, a charge of tax under Section 42 is a most serious deterrent to trading with India. Other countries do not admit the validity of India's claim to tax and refuse double tax relief for Indian tax suffered. At the present time this means that any profit attributed to the act of purchase suffers an overall tax burden of more than 100 per cent. where the non-resident buyer is resident, for example, in the United Kingdom, United States, Germany or Japan. A consequence of this kind will affect trade with India to an increasing extent as Section 42 is more and more diligently applied and it should not be forgotten that in recent years India has relied upon buyers in these territories to take more than 50 per cent. of her exports. The result of allowing this position to continue will inevitably be a grave restriction of trade to India's detriment in a buyer's market; overseas sellers will either refrain from trading with India or will do so only where the title in the goods and payment can be obtained outside India. It is very essential therefore that prompt steps should be taken (a) to amend the law to exempt, in the case of the non-resident who buys or sells goods in India, the manufacturing and other profits attributable to operations carried on outside India by the non-resident and (b) to exempt profits when the non-resident has not an established place of business in India.

Several of the difficulties referred to above arise because of the absence of any statutory definition of 'business connection' thus permitting a variety of interpretations by individual Income-tax Officers. This omission should be remedied it is suggested, in such a way as to ensure that non-residents may be more precisely aware of their liabilities under the Act. Based on current international practice as agreed to by most countries in recent double income-tax agreements—the negotiations of which, particularly with the United Kingdom as India's largest customer, is very essential—an explanation should be added to Section 42 providing firstly that a non-resident person shall not be deemed to have a business connection in the taxable territories unless he maintains therein a branch, management, factory or other fixed place of business; secondly that an agent in the taxable territories for a non-resident person shall not be deemed to be a business connection unless he has and habitually exercises a general authority to negotiate and conclude contracts on behalf of the non-resident or keeps a stock of merchandise from which he regularly fills orders on his behalf; thirdly, that a non-resident person shall not be deemed to have a business connection in the taxable territories merely because he conducts business dealings through a *bona fide* broker or general commission agent acting in the ordinary course of his business as such; and, fourthly, that a fixed place of business or an agency maintained by a non-resident person solely for the purchase of goods within, and the sale or conversion of these goods without, the taxable territories shall not be deemed to be a business connection.

Question 52.—What modifications would you suggest in the definition of 'agricultural income' Section 2(1) to avoid the contingency of the same income being taxed by the Central Government as well as the State Governments, e.g., in respect of income from forests, dividends from agricultural companies, etc.?

It will be necessary to change the definition of 'agricultural income' so as to exclude the portion of dividend which is proportionate to the agricultural income of agricultural companies such as tea companies. The ruling of the Bombay High Court in *Re: B. F. Guzdar Vs. C. I. T. Bombay City (XXII-ITR-158)* laying down that the entire dividend from tea companies is liable to Indian Income-tax has made certain portion of the income liable to double taxation, i.e., agricultural income-tax and Indian income-tax. Before this ruling the practice of the department was to take only a certain proportion of income from dividend as income from non-agricultural source. That position should be restored by suitably amending the definition of 'agricultural income' so as to exclude the amount proportionate to agricultural income of such companies as income derived from both agricultural and non-agricultural sources. Income from forestry has been held to be taxable in some cases and not taxable in others. It is better to define precisely whether such income should be included in the income liable to Indian Income-tax.

As a matter of fact, there is very little agricultural operation in forestry while large amounts are realised by the sale of timber. Such income should be liable to Indian Income-tax and not to agricultural income-tax. It is, however, not every year that such income is realised by the owner of forests and it would clearly be unjust if the total income realised in a certain year is made liable to tax in that year. It is, therefore, suggested that such income should be spread over a period at least five years so as to reduce the incidence of taxation on such

occasional realisations in lump sums. It may, however, be noted that our forests have very seriously been used up during the war and this has caused much soil erosion and brought about a change in the climate of certain parts of the country. As a matter of policy the growth of forests must be encouraged and for this reason it may be found necessary to exempt the income from forests altogether for atleast ten years or so.

Question 53.—Agricultural income should not be integrated with non-agricultural income for rate purposes. The method of calculating agricultural income is quite different and no Act makes any attempt whatsoever of equating the statutory income with the real income. For instance in some States only a certain fixed percentage of the income is admissible by way of deduction for collection charges and not the actual expenses. If income calculated in this manner is to be clubbed with other income it would clearly boost up the rates of tax levied by the State and Central Governments. After the abolition of Zemindary the importance of agricultural income tax has dwindled to a large extent and only big farmers will now be liable to agricultural incometax. Consequently there does not seem to be any material advantage in clubbing agricultural and non-agricultural incomes for purposes of determining rate of tax. Tea companies pay tax at maximum rate and the clubbing of agricultural income in these cases will not make any difference whatsoever.

Question 54.—The taxation of agricultural income should be left entirely with the States for their development consistent with their resources.

Question 55.—The point raised in this question has been recognised by the enactment of Section 12AA so far as literary and artistic works are concerned. It may well be extended to other works of similar nature. In building contracts the actual profit can be worked out only on completion of the work. In such cases the profit should be spread over the period taken for completing the work.

Mining industry and such other industries which require exploration and prospecting over a long period should be entitled to deduct such preliminary expenses out of the profits for 4 or 5 years or the profits realised in the first year should be spread over the period of prospecting and exploration and the amount spent in each year should be deducted out of the profits attributed to that year. Any excess of expenditure over income must be treated as a loss and carried forward to the subsequent year.

Question 56.—Recently Section 4(3) (i) has been amended so as to restrict the exemption to income from business which is carried on on behalf of a religious or charitable institution to only those cases where the business is carried on in the course of the actual carrying out of a primary purpose of the institution or the work in connection with the business is mainly carried on by the beneficiaries of the institution.

In the case of the Gadodia Charitable Trust it was held that the word 'property' includes business also. It is to neutralise the effect of this ruling that the law has been changed but the change is not in the right direction. Ours is a welfare State and the bulk of revenue derived from taxation has to go for the uplift of the society and to raise the general standard of living of our countrymen. It is the duty of the State to provide medical relief and education to all persons living in the country. If there is a charitable minded person who devotes the whole of the income from business to a charitable purposes such as starting of educational and research institutions and for that object wants to make over his prosperous business to the trustees of a charitable trust, the State should not step in for a share of the proceeds of such a business by declaring such income not exempt from tax. It is, therefore, suggested that where a trust is genuine and its objects are well-defined so as to include objects of general public utility, the income from business carried on by such a charitable trust should be clearly exempted from taxation and Section 4(3) (i) should, therefore, be suitably amended for that purpose.

Question 57.—Business profits of cooperative societies were exempted in order to encourage the cooperative movement, but now the conditions have considerably changed and those considerations need no longer be taken into account. All cooperative societies should, therefore, be taxed like Companies and the members may be allowed relief on dividends received from the societies. The entire income should be brought under assessment.

If a very good case can be made out and exception is sought to be made in respect of cooperative societies which are cooperative ventures, mutual and non-profit making in character, tax on income applicable in their cases should be 50 per cent. of what the Companies are called upon to pay.

Question 58.—Concessions given to new industrial undertakings under Section 15C should be continued further and if after allowing all depreciation allowances and 6 per cent. on capital there is a loss, such loss should be allowed to be carried forward for set-off against subsequent profits.

Question 59.—No concessional treatment is necessary except the double taxation relief. In any case the tax levied by a foreign country should be allowed as a deduction.

Question 60.—At present 1/6th of the total income subject to a maximum of Rs. 6,000 is exempt. This limit may be raised to 1/5th subject to a maximum of Rs. 10,000 in view of the low purchasing power of the money and general rise in the level of incomes. Indirectly it will benefit insurance companies which collect money from the public for financing Government and semi-Government loans.

Question 61.—There is no doubt that in the present circumstances the Department is not really assessing the business profits but also a part of the capital represented by the difference between the pre-war price of plant and machinery and the high prices prevailing at present. Another important point for consideration is that the industry should be in a position to replace the worn out plant and machinery at the prevailing high prices. If it is unable to do so the efficiency of the industry is likely to suffer to the detriment of the interest of the country as a whole. It is not the individual industry whom we are going to favour by allowing larger depreciation allowance but it is the industry as a whole which should be considered. This point has been raised in U.K. and U.S.A. also but no solution has yet been found of the problem. The economists and the accountants, however, agree that some change is essential and the re-valuation of existing assets for depreciation purposes would be ideal. As a matter of safeguard it must be laid down that such funds shall not be available for distribution amongst the shareholders as dividends.

Question 62.—Certain changes are called for in the Classification of assets for the purposes of depreciation, rates of depreciation and methods of computing allowances. These are in brief as follows:

(a) Depreciation allowances should be on the initial cost and not on the written down values, (b) Rates of depreciation as at present are adequate, (c) There have been cases where the Incometax Officers have grouped together different kinds of machinery because of their installation in one industrial unit for the purposes of depreciation allowances and have refused the modicum of depreciation allowances on each type of machinery set up. This difficulty may be obviated, if necessary by a change either in law on the point or by the Central Board of Revenue issuing definite instructions to the Incometax Officers and the public; (d) Depreciation should be admissible on residential premises and should be allowed to houseowners according to the classification of buildings. The statutory allowance of one sixth of the annual letting value must be abolished. It is recommended that Section 9 of the Incometax Act might be amended accordingly.

Question 63.—Making of depletion allowance from wasting assets is only just and equitable and it is not considered as a concession. All lump sums paid in acquiring leases of mines, etc., should be admissible at a uniform rate during the period of the lease if less than 20 years or during the period of 20 years if the period is more than 20 years. Unless this is done we are taxing a portion of the capital and not only the profits. There is no justification why such an allowance should be admissible in the case of plant and machinery and not in the case of mines, etc., acquired for a definite period on payment of lump sums. In either case the asset is wasted by the working and the allowance is called for in all cases. Apart from depletion allowance, some tax concession must be given for the development of mineral resources.

Question 64.—Provision of specific allowance for family and dependant's is strongly recommended. In the case of a Hindu Undivided family, allowance will have to be made for the family and dependants of all the members of the Hindu Undivided family. There is nothing surprising in this demand as it is only a necessary committant of an assessment on an incorporate body like the Hindu undivided family treated as one unit. Considering the high cost of living the allowance for each dependant should vary from Rs. 1,500 to Rs. 2,000.

Question 65.—This is a very important question. Truly speaking in every business the Government is a major partner. The share of the Government fictitiously goes up by the disallowance of expenditure actually incurred. Such expenditure is left to be borne by the smaller partner and damps his incentive to earn more and induces him to find out ways and means for concealing or suppressing income. The allowance should con-

sequently be liberalised. It is suggested that the following allowances should be added to the list of allowances under Section 10(2):

(i) Indispensable capital expenditure not creating tangible asset should be allowed, e.g., preliminary expenses, amount paid for goodwill, consideration for acquisition of rights, patents, royalties, development expenses, prospective expenses and price paid for assignment of leasehold land, etc. Such expenditure is wholly and exclusively laid out for the purposes of the business and have got to be written off. When benefits arising out of such capital expenditure are taxed, why should not the capital expenditure be allowed? The poor assessee is left to shoulder such capital expenditure out of the smaller share he has.

(ii) At present expenditure on Incometax Appeals is not allowed. This is absolutely unfair. Expenditure on all successful appeals must be allowed. The present tendency is that the Incometax Officer never interprets Incometax Law in favour of the assessee. They make over-assessments on flimsy grounds and drive the assessee to go in appeal. If expenditure on such appeals is not allowed the poor assessee is saddled with a burden of unjust expenditure.

(iii) Unless collusion is proved, no part of expenditure incurred on salary, wages, bonus or commission should be disallowed. The Incometax Officer is no judge of the quantum of expenditure necessary for a business.

(iv) Allowance for depreciation needs to be liberalised as suggested beforehand.

Question 66.—No. The consolidation of incometax and supertax is not favoured. The present rate structure is not at all satisfactory. It is extremely cumbersome and the computation of tax liability has become an extremely complicated affair. Rates structure should be so simple that every assessee should compute his tax liability without difficulty. The slabs are too narrow and the jump from one slab to another is too steep. The aggregate incidence of taxation adversely affects incentives to earn more or in other words incentive to produce more. The maximum tax limit should in no case exceed 0-10-0 in a rupee. The exemption slabs should be more liberal and should vary with the number of dependants an assessee has to maintain. The aggregate incidence of incometax should be confined from six pies in a rupee to 0-2-6 in a rupee and the aggregate incidence of supertax should be confined from 0-1-0 in a rupee to 0-7-6 in a rupee. It has been noticed that in several cases with the present rate of incometax and supertax the assessment of taxes often exceeds the actual income earned by an assessee because his assessment is subjected to a number of disallowance. If an assessee has to pay up a major portion of his income in the shape of taxes, he is hardly left with anything to build up reserves for ploughing back into his industry and business. The present rate structure acts adversely on industrial and commercial expansion. The rate of surcharge stands self-graduated being a percentage of the tax which is graduated, and therefore calls for no change.

Question 67.—Have you any change to suggest in the exemption limit for individuals (Rs. 4,200) and for Hindu Undivided families (Rs. 8,400)?

While relief with regard to the exemption limit should be given in respect of individuals as in the case of individuals in the U.K. for wife and children of the assessee, the initial exemption limit in the case of Hindu Undivided Families should be thrice that of the limits prescribed for individuals.

Question 68.—(a) The distinction between earned and unearned incomes for purposes of tax liability may be continued. Such a distinction is in vogue elsewhere and is generally justified on taxation principles. Earned income is supposed to represent the result of personal initiative and effort and on that basis, is considered as entitled to special encouragement.

(b) We have no particular suggestions to make in regard to the definition of earned income. The present position seems to be satisfactory.

(c) Earned income relief is limited to one fifth of the income or Rs. 4,000 whichever is less. Once the principle of earned income being eligible to a concessional rate is accepted, there is considerable force in the point of view that the relief should be extended to a larger sector. We suggest that the limit may be raised to Rs. 6,000.

Earned income relief should also be available in respect of income of a minor partner assessed in the hands of his father.

Question 69.—Cost price or market price whichever is lower is the best principle but unfortunately the Incometax Officer does not stick to it and insist on stock valuation on the basis of cost price or market price. They ignore the expression 'whichever is lower'. Such action creates trouble for the assessee as he has invariably to go up in appeal.

Question 70.—Hindu Undivided Family should not be assessed as an unit but the individual members alone should be taxed on their shares of income. Here doubling the non-taxable limit does not give adequate relief.

Question 71.—Exemption from incometax must be allowed in respect of voluntary surrenders by managing agents of the whole or a part of the managing agency commission. No question of abuse arises in such cases as the amounts surrendered become liable to tax in the hands of the company. The managed company by such a generous action of the managing agents is provided with funds for ploughing back into the industry. In lean years the loss of the managed company is curtailed by the surrender of the managing agents. No question of misuse arises in such cases either.

Question 72.—The assessee should not be asked to pay more than the higher or the highest rate of tax levied by any one country. Where such agreement is not possible, the country where the income accrues or arises, should alone be entitled to tax that income and the other country should forgo the tax on that income.

Question 73.—The exemption granted under Section 60 with respect to unrealised rent is extremely rigid and ineffective. Due to rent controls in most of the States, there are cases where the tenants neither pay the rent nor vacate the premises inspite of lengthy and costly litigation. The condition laid down in rule 38 of exemption should be liberalised so as to exclude the rent which could not be realised inspite of best efforts by the assessee. As suits are not filed every year for arrears of that year, it is improper to limit the exemption to the rent of one year.

The *bona fide* letting value should be fixed with due regard to the rent chargeable.

Statutory allowance of 1/6th for repairs is inadequate. While the rents have been fixed at pre-war rates by Rent Control Acts, the expenses on repairs have gone up considerably due to increase in wages and the price of building materials. This allowance should, therefore, be raised to 1/4th.

Another point for consideration is that some depreciation allowance should also be admissible for deduction. After all the life of every property is limited and all the more so in industrial towns like Bombay, Calcutta, Madras and Kanpur where damage is greater. There is no justification for allowing the depreciation to a shopkeeper if he owns the premises in which the shop is kept but disallow it to the owner of the premises if he happens to be a person different from the shopkeeper. If machinery is let out to a tenant, depreciation allowance on that machinery is admissible to the owner out of the rent realised from the machinery. Similarly if any business premises are let out, depreciation on the value of the building should be admissible to the houseowner but simply because the income is assessed under the head 'property' no allowance is usually made for depreciation in respect of such property. It is, therefore, suggested that an allowance of at least 2½ per cent. on the value of the property should be admissible by way of deduction on account of depreciation.

Law charges in litigation with tenants should also be an admissible deduction.

Question 74.—The present law in respect of carry forward of losses is unsatisfactory. Under Section 24 losses of one year can be set off against the income from any other source of the same year but if the loss exceeds the income from other sources in that year such excess or where there is no other source, the whole of that loss can be carried forward and set off against income from the same business in the subsequent year. There is considerable case law on the point whether the business in the subsequent year is the same business or a different business. As such there is no justification for imposing this limitation. It should be permissible to claim the loss of one year against income from any other source in the subsequent years and no liability to tax should arise unless all these losses are altogether wiped off. This point has been agitated in the Press several times and included in representations made by various business organisations not only in India but also in the U.K. Only recently the U.K. law has been changed so as to make it possible for an assessee to carry forward the loss for setting off against income from any other source of one subsequent year. The relief allowed is not full but all the same it is some improvement on the present position. Another limitation imposed by the law of U.K. is that the business in which the loss was incurred should be still running in the subsequent year. Such a limitation should not be imposed in India. Very often an assessee may find it useful to close down that business to save himself from further losses. If, in such circumstances the losing business is closed, the loss suffered in that business must be an admissible deduction from any income in subsequent years. It is clearly unjust to levy tax at the present high rates on a person who is burdened with heavy losses of preceding years simply because he happens to derive some income from investments and

other sources in subsequent years. The capacity to pay is seriously impaired and this point must be recognised in the enactment of any taxing Statute.

Question 75.—The provisions of Section 18A were introduced to curb inflation during the last War. At present money market is extremely tight and hence it is not deemed necessary that Section 18A should continue on the Statute any further. Provisions of Sections 18A and 23B are mainly responsible for the delay in making final assessments. Having realised the tax according to the returns, the Incometax Officers, allow the cases to drag on for about four years till they are forced to make the assessment by virtue of the provisions contained in Section 34. The system of advance payment of taxes should, therefore, be abolished.

Question 76.—It is suggested that the copy of the reasons recorded by the Incometax Officer and the copy of the Commissioner's sanction for the issue of notice under Section 34 should be sent to the assessee along with the notice under Section 34. This step is necessary so that the assessee may know the reasons which have prevailed upon the Incometax Officer for issue of the notice under Section 34, and thus he may get an opportunity to meet the points raised in the order of the Incometax Officer, in the course of the proceedings under this Section. Further under Section 34 clause (1) sub-clause (b), the information in the possession of the Incometax Officer must be new and on a point of fact. The word 'opinion' should, therefore, be qualified accordingly.

Question 77.—It is not so much the question of changing the law as of changing the procedure followed by the Incometax Officers. At present what happens is that Incometax Officers without care fully scrutinising the returns and copies of Profit and Loss Accounts and other papers submitted with the returns mechanically issue notices under Section 22(4) and 23(2) and start probing into matters which are already apparent from the record. Considerable time of the Incometax Officer as well as of the assessee is wasted in this manner. What is suggested here is that the Incometax Officer before issuing notice under Section 22(4) or 23(2) should carefully scrutinise the return and documents submitted with the return and jot down the points which require further elucidation from the assessee or the scrutiny of accounts. A brief note should be prepared by him describing these points and when the assessee appears with the accounts, the points raised should be cleared and the assessment should be completed in his presence so far as possible. At present without any rhyme or reason cases are postponed from day to day and there is hardly any case in which the assessee is not required to attend with his accounts for a number of times. The Incometax Officer should adjust his cause list so as to fix up only those cases which he can take up during the working hours of the day. An attempt should be made to complete the scrutiny of the accounts as far as possible on the same day. The fear of criticism by superior authorities should be eliminated altogether from the minds of the Incometax Officers as this fear alone is responsible in most cases for asking the assessee to prepare copies and notes from his account books and file them on the record. This extra burden should not be thrown on the assessee. If any useful information is required from the accounts, the Incometax Officer should be asked to take notes from these accounts. In some cases the assessee has virtually to copy out almost all his accounts for filing before the Incometax Officer. Some Incometax Officers, although they have nothing on the record against the assessee, postpone cases from day to day simply to create an impression on the minds of inspecting officers that the accounts have been thoroughly examined by them. It would be good if Section 22(2) is so amended as would require an assessee to submit a return not earlier than six months after the close of his accounting period.

Question 78.—The Appellate Tribunal should not have powers to enhance the assessment. If there is any discovery or concealment after the order has been confirmed by the Appellate Tribunal there is nothing to stop the Incometax Officer from proceeding under Section 34. The law has given ample powers to the Incometax Officer to prevent any income from escaping assessment and consequently the suggestion for conferring the power of enhancement on the Appellate Tribunal is uncalled for. Besides, the Appellate Tribunal is a judiciary body and not an assessing body. If they are allowed enhancements the fundamental principle distinguishing judicial and assessing authorities disappears.

Question 79.—The entire income of the company should not be subjected to Corporation Tax. It is suggested that the first slab of Rs. 50,000 should be exempt from Corporation Tax. This will exempt all small companies from Corporation Tax and also give the much-needed relief to bigger companies in bad years. No element of progression is necessary in the levy of Corporation Tax if the above suggestion is accepted.

Question 80.—If the recommendations made above is accepted, it would not be necessary to levy different rates of tax for different types of corporate enterprises. The holding companies should not be asked to pay Corporation Tax on income from dividends from Companies which have already been subjected to Corporation Tax.

Question 81.—The demand for exemption of inter-corporate dividends from Corporation Tax is fully justified. The present system of levying Corporation Tax on dividends in the hands of every company leads to hardship and double and treble taxation of the same income. For instance 'A' company pays dividend out of its taxed profits to 'B' company. At present the 'B' company is again asked to pay Corporation Tax on the gross amount of this dividend and if a portion of 'B' company's dividend goes to a third company 'C' that company is also asked to pay Corporation Tax on this dividend. As the rates of Corporation Tax are pretty high, the burden becomes unbearable.

It is altogether unfair in the case of holding and investment companies whose only business is to hold securities or shares in other joint stock companies. The main object of such investment companies is to even out investments and to encourage the formation of capital for investment in other industrial enterprises but this object is frustrated if such companies are made liable to Corporation Tax on profits which have already been subjected to that tax in the hands of the original company. There is already an exemption granted by the Governor-General in Council *vide* notification No. 47, dated the 9th December, 1933 under Section 60 of the Act but the tendency at present is to ignore the conditions laid down in the rule and refuse exemption on arbitrary grounds. What is suggested in the alternative is that the rule granting exemption should be incorporated in the statute and the order refusing exemption should be appealable like other orders of the Incometax Officers. It should no longer be within the executive powers of the Central Board of Revenue. The main point, however, is that in principle the double and treble taxation of inter-corporate dividends to Corporation Tax should be altogether avoided. If this is accepted the exemption conferred under Section 60 on public investment companies would become unnecessary.

Question 82.—Banks and Investment Companies should not be asked to pay Corporation Tax on income from dividends. The reserves which are compulsory according to Indian Banking Companies Act should not be subjected to Corporation Tax. In the case of Insurance Companies, the whole of the policy holders' surplus should be exempted from tax as in U.K.

Question 83.—Undistributed profits should not be liable to maximum rates of incometax. At present a rebate of 0-1-0 per rupee is allowed on undistributed profits. This concession is not adequate. This limit should be raised to 0-2-0 per rupee. The main point for allowing this concession is to encourage companies to plough back their profits into the business. It would encourage formation of capital which is an essential need of the day. Further the Government has not to pay any rebate on undistributed profits to shareholders. By way of safeguard it may be laid down that if in any future year the company draws on its reserves for distribution of profits it may be asked to say so in the certificate issues to the shareholders and in that case the rebate on the dividend may be reduced accordingly.

Private companies can easily be classified into two categories:

- (1) engaged in industrial enterprises;
- (2) engaged in commercial enterprises;

In the case of companies engaged in industrial enterprises, the need for the formation of reserves for ploughing back into the industry is as great as those of public companies and what is suggested is that before applying Section 23A to such companies, the Incometax Officer should take into account not only the loss incurred in earlier years or the smallness of the profits made by the Company as at present laid down in Section 23A, but he should also consider the sums ploughed back into the industry by renovation of building, plant or machinery or by other capital expenditure incurred in the interest of the business. In such cases Section 23A should not be applied as in fact due to such expenditure it will not be possible for the company to distribute a larger dividend. The expansion of the business will ultimately lead to greater profits which would be automatically liable to tax yielding larger revenue to the State. In the case of commercial concerns the limit of 60 per cent. should be reduced to 40 per cent.

Question 84.—It is indeed unfair that dividends distributed by a company should again be charged to super-tax in the hands of the shareholder. It was not felt at the time when the rate of Corporation Tax was not more than 0-1-0 per rupee but this rate has been going up in the interest of revenue considerations and has been taking away an appreciable portion of the profits by denying the company either the distribution of dividends or the

building up of its reserves. The Corporation Tax should also be deemed to have been paid by a Company on behalf of its shareholders and credit for the same should be allowed to the shareholders in their personal assessments.

Question 85.—Industrial, commercial and similar other enterprises undertaken by the Centre, States and Local Bodies should be subjected to tax exactly in the same manner as limited companies.

Question 86.—What is needed is an improvement in the morals of the people as a whole. Resort to methods such as the publication of names of defaulters and the imposition of any obligation of the type envisaged in the question on the assessee is not favoured. If the fruitful employment of recognised professional men such as Chartered Accountants as a means to minimise the work of the Incometax Officers is sought, the form of Certificate must be prescribed and once a certificate on the prescribed form was obtained, the same must be honoured without its being subject to a suspicious examination by the Incometax Officer. The matter of fees for the issue of certificate must be left to be settled by the clients and the Chartered Accountants without extraneous interference.

Question 87.—No further amendment to Section 61 is necessary. The present system of representation of assessee appears to be satisfactory.

Question 88.—What is needed is an improvement in the morals of the people as a whole. Resort to methods such as the publication of names of defaulters and the so-called public disgrace of delinquents hardly serve any purpose, if the fundamentals of character are lacking. These ill considered *Ad Hoc* measures go only to blunt feelings against the so-called crime of tax evasion and rather encourage people in its indulgence after the first default. The whole matter needs a statesmanlike attention rather than a narrow policeman's outlook.

Question 89.—No, the perquisites given to employees of business undertakings do not result in considerable loss of revenue. As a matter of fact Incometax Officers have already started enquiries into the perquisites and have started including such portion as they consider to be excessive which is not justified.

Question 90.—Powers possessed by Incometax Officers are sufficiently wide and no fresh steps seem to be necessary for safeguarding payment of tax dues from companies under liquidation. All the same it is suggested that as soon as a company decides to go into liquidation it should intimate fact to the Incometax Officer and place all its accounts for the period which has not been subjected to incometax. It would enable the Incometax Officer to determine the taxable income and the tax due from the company. This amount can be intimated to the Liquidator and the Incometax Officer should stand *pari passu* with all unsecured creditors.

Question 91.—This question of conferring powers to search premises and seize documents and books of accounts on Incometax authorities has been before the public for quite a long time. It has been opposed tooth and nail by the public and representatives of trade associations and business communities. Such a step, it is feared, will simply embitter the relations between the assessee and the Department. It will increase abuses and corruption in the Department. There are not many countries which have conferred such powers on the Incometax authorities. Evasion of avoidance of tax will not be prevented by conferment of such powers. The best method of checking avoidance is public propaganda so that a tax-dodger is not held in esteem by the public. Training of Incometax Officers for extending courtesy towards assessee is also very essential. The present method of behaving like police officers and discrediting every statement of an assessee even on minor points creates a very bad impression on the minds of even honest assessee. In short, mere powers of search will not minimise evasion and avoidance of tax but will lead to harassment and defamation of assessee and abuse and corruption of the Department. What is wanted is that the assessee should feel that it is his duty to contribute to the public revenue according to his income and every Incometax Officer should feel that besides collecting the revenue he also acts as a Judge between the assessee and the State. He should develop precisely a judicial frame of mind and should not so behave as to create an impression that he is out to collect revenue by fair means or foul.

Question 92.—No precaution seems to be necessary to prevent the creation of an artificial legal entity. The Incometax Officer has very wide powers not to recognise a firm which is not a genuine partnership. The formation of a company makes the profits liable to Corporation Tax which would otherwise not be attracted. There is nothing like a family partnership. The status of a Hindu Undivided Family with respect to the business or the property which forms the subject of partnership must be

shaped before a partnership is formed. This introduces very important changes in the character of the ownership of that property and to suggest that it is only for reducing the rate of tax that this practice is resorted to will be altogether incorrect. Where a family is dissolved and the members including the minors agree to carry on the business in partnership, such firms should be recognised by the Department and the practice of Incometax Officers viewing such partnership with suspicion should be discouraged.

Question 93.—It would not be just to recover the unrealised tax of any partner from the firm or to make the other partners liable for it. It would clearly be unjust if without a warning a firm is asked to bear the burden of tax payable by an ex-partner. The bogey of unrealised tax from partners of a registered firm is not quite intelligible in the face of provisions of advance payment of tax under Section 18A and provisional assessment under Section 23(B). It may, however, be pointed out that difficulty in realising the tax arises by very late assessments sometimes four or five years after the end of the accounting period which is to be assessed. During this long period considerable changes in the fortunes of the taxpayers are likely and some of the partners may become untraceable. It is, therefore, suggested that the Incometax Department should be made more efficient so as to dispose off assessments as far as possible within the year to which they relate.

Question 94.—Yes, the present arrangements relating to recovery of incometax are adequate. Instead of tightening the machinery for recovery proceedings, the existing provisions therefor should be liberalised. Over assessment and consequential heavy demand often dislocate the economy of assessee and impairs his capacity to earn. In any case taxes in respect of disputed income under appeal must be stayed pending the final disposal of the appeal.

Question 95.—Placing of tax liability upon the shareholders of a private limited company in proportion to their shareholdings is not favoured. This cuts at the very root of the principle of formation of companies. Cases of non-payment of incometax by private companies have not reached such a stage as to justify taking of such a drastic step.

Question 96.—No. The property should be assessed in the name of its rightful owner only. The question whether the ostensible owner is the rightful owner can be decided only by a civil court and the Incometax Department is not competent to decide it.

Question 97.—Relations between the Incometax Officer and the assessee can never improve so long as the Incometax Officer considers himself to be a machine for collecting taxes by fair or foul means. The entire outlook of the Incometax Officer needs to be changed. Seldom an Incometax Officer has been found interpreting an issue in favour of the assessee. On the contrary, he will twist his assessment and import surmises and conjectures to build up a case against the assessee. He would not grant extension of time to an assessee though he may himself put off the case to suit his own convenience. To make an assessment according to returns is probably held by the Incometax Officer to be below his dignity and below his efficiency. To enhance the income returned is taken to be a measure of efficiency and the Budget Phobia during the months of February and March make the Incometax Officers wild. They do not adjust their work. They drag on cases right upto February and March and then make arbitrary assessments. Budget Phobia is responsible for all the obnoxious and defective assessments. The Incometax Officer should have nothing to do with the amount of taxes that have to be collected.

Question 98.—(i) The present system of issuing notices under Section 22(2) is defective in principle. Notices should not be issued to any assessee carrying on business unless and until six months have expired from the close of the financial year. It will create a fair distribution of work.

(iii) Penalties should not be levied as a matter of routine. It should not be treated merely as an additional tax. Penal provisions should be invoked only where it is established that the assessee's intention was to conceal his income.

(v) There has been considerable agitation on the question of administrative control over Appellate Assistant Commissioners. Even the Select Committee on the Incometax (Amendment) Bill, 1952 was very sharply divided on this point but the Government seems to be adamant and has put forward one excuse or the other which leaves the public unconvinced. What is wanted is that the Government should take courage in both hands and effect the much-needed reform which would go a long way in improving the relations between the assessee and the Department. The present arrangements create grave doubts in the minds of the assessee as they seem

to get no relief on important points from the Appellate Assistant Commissioner. Some people would prefer to take their appeals direct to the Appellate Tribunal and leave out the Appellate Assistant Commissioner altogether, as the decision by the Appellate Assistant Commissioner simply prejudices the assessee's case and reduces his chances of getting a fair deal even at the hands of the Appellate Tribunal.

Question 99.—There is no doubt that undue delay occurs in the course of assessment proceedings. This is simply due to suspicion in the minds of the Incometax Officers and also a sense of fear of criticism by the Inspecting Officers. There is absolutely no justification for either. The feeling of suspicion can be dispensed with if the Incometax authorities realise that they have very wide powers in reopening assessments if any definite information comes into their possession of any concealment even after the assessment of a particular year has been completed. The feeling of fear in the minds of Incometax Officers can be removed if the Inspecting Officers are helpful in their criticism and make only constructive suggestions. The personal likes and dislikes against officers should be altogether eliminated. Formation of groups, parties and factions among officers should be discouraged.

As already pointed in the answers to the foregoing questions, the provisions of Sections 18A and 23(B) are mainly responsible for undue delay in the course of assessment proceedings.

Question 100.—Only special circumstances such as war would justify the levy of Excess Profits Tax or Special Business Taxes

Question 101.—In framing the Estate Duty Bill the provisions of U.K. Act have been borrowed word by word. It needs modification on the lines brought out in the report of some of the members of the Select Committee. In this connection, the following suggestions are worth considering:

- That minimum taxable estate considering the present value of the currency should not be below Rs. 1,50,000.
- That rates should be as low as possible in the beginning.
- Clause 80 sub-clause (2) of the Bill should be dropped altogether else it would give a death blow to dealings in shares in the Stock Exchanges.
- Absolute gifts to public charities should be recognised whenever made and not only those made more than six months before death.

Question 102.—There should be no differentiation in the matter of rates chargeable on self-acquired property and property forming the estate of a deceased. Not only its working would lead to considerable complications but in some cases it may be found almost impossible to decide which portion of the property left by the deceased was inherited and which was self-acquired.

Additional points in respects of Taxes on Income (Part II of the questionnaire) which the drafting sub-committee recommend for adoption by the U. P. Ad Hoc committee on Taxation.

1. Clearance of arrears of incometax assessments and cases with special reference to rebates and refunds.

In view of the enforcement of provisions contained in Sections 18A and 23B of the Indian Incometax Act in respect of advance payment of tax and provisional assessment respectively, final assessments are not disposed of till they are about to become time barred. After a lapse of four or five years an assessee is put to considerable inconvenience and at times in impossible situations if he is asked to explain and lead evidence on points raised by the Incometax Department. Assessments made at that late stage in this context do not make it possible for the assessee to find either the money or to face the avoidable embarrassments. Litigation then ensues to the detriment of all concerned and with undesirable consequences following.

There are a number of cases of banks and insurance companies under which losses have been incurred but tax has been deducted on dividends and interest on securities. The Department is generally tardy in disposing of such cases and the assessee is deprived of considerable sums due to them as refunds. There is no reason why such assessments should be kept pending in view of the provisions contained in Section 34 with regard to incomes escaping assessment and concealments could be appropriately dealt with when discovered. In fact pendency of assessments over a long time will only be found leading to inefficiency all-round. Assessments must be made and completed in the same year to which they relate and carryovers must be an exception rather than a rule.

It is common knowledge that money conditions are hard in so far as industry and business are concerned. With the development of buyers' market everywhere, conditions have hardened further. If much relief cannot be extended in the field of taxation, industry and business should at least be freed from adverse consequences arising out of arrears in assessments. Speedy clearance of arrears of incometax cases with special reference to rebates and refunds will go a long way in freeing them from worries and industrial and business ventures can look forward to economic rehabilitation.

2. Avoidance of unnecessary litigation between the assessee on the one part and the Central Board of Revenue and the Incometax Department on the other through appropriate liaison and assessee contact work.

On an analysis of the litigations on Incometax matters, it will be found that most of these litigations are avoidable and unnecessary. The attitude in general should be for the assessee and the Central Board of Revenue and the Incometax Department to settle affairs of taxation without going to Courts and the forum of law.

It has been found that a particular decision on a point by the High Court favourable to the assessee in respect of a particular assessment year is not invoked for application for the subsequent assessments too though these assessments after going through the High Court through all processes involved will be conditioned by the same decision or order. It is realised that the Department does not enjoy the power to alter the decisions of Appellate Tribunal in this context and the application of decisions may not, therefore, be possible in certain cases. The Act may be amended suitably to meet such ends also. Tribute Trust Privy Council Decision 1939 (VII I.T.R. 415) arising out of assessments to incometax form 1933-34 to 1938-39 were made. The assessee applied to the Commissioner of Income Tax to cancel the assessment in view of Privy Council Decision but the Commissioner of Incometax refused. The High Court intervened and declared the assessments a nullity (12 I.T.R. 370). This order was upset by the Privy Council (XVI I.T.R. 214) which held that the assessments were not a nullity. The result was that the assessee had to pay six years tax which was not at all due as the Trust income was exempt under Section 4(3) (i) of the Incometax Act. The Incometax Investigation Commission took a serious view of the matter and recommended change in Law vide Pages 126 and 127 para. 281 of the Report.

It is recommended that special liaison officers for public relations work may be appointed with headquarters at convenient centres such as Bombay, Calcutta, Madras, Kanpur and Ahmedabad, etc. These public relations officers must be drawn from judicial cadre and must be independent of the Central Board of Revenue in order to be able to inspire confidence all-round. The assessee in cases of differences between them and the Central Board of Revenue and the Incometax Department may approach these Liaison Officers who shall make a note of the assessee's cases and get matters settled as they ought to be without the assessee having to go to Courts of Law and expensive litigation. This step will also improve assessee—Department relationship considerably and help in quick and better collection of taxes.

POINTS NOT COVERED ABOVE.

The attention of the Chamber has been drawn to circular No. 8 (XXI-3), dated the 10th April, 1953 issued by the Central Board of Revenue in which it is laid down that a shareholder of a company should not obtain credit for the tax paid by the company on dividends, if the shares are not registered in the name of the assessee. This instruction would prove hard in the case of persons who borrow money from the banks for the purchase of shares and the banks by way of additional security get these shares transferred in their names. In such cases there is no intention of avoidance of tax. The Banks do not declare the income from these dividends in their own returns and give credit for the dividend to the real owner. In such cases certificates from the banks should be considered sufficient and the condition of the shares being registered in the name of the assessee should be waived. Such a step is absolutely essential in the interest of the banking business. It is not only when advances are made that banks get shares transferred to their names but many times banks hold shares as nominees or trustees or executors also.

2. Cases have been referred to the Chamber where Incometax Officers have attributed the profits of the firms to persons who are not the partners of the firm without even giving them an opportunity to say something in their defence. Such a procedure is against all canons of law and must be looked down upon by the higher authorities. Unless a sense of fairness and justice is developed in the Inspecting Officers and crooked ways of over-zealous and incompetent officers are not seriously taken notice of there would not be much improvement in the Department.

PART III.—COMMODITY TAXES (CENTRAL AND STATE)

CUSTOMS

IMPORT DUTIES.

Question 103.

Within the general structure of Indian Custom Tariff simple additions and alterations could be made from time to time to make certain entries more intelligible to merchants and to bring it in line with the changing pattern of trade. Since the present Indian Customs Tariff has been the work of experts and the same has come into use and understanding tolerably well no change can be proposed in the general structure thereof. Correlation of the Indian Customs Tariff with the Import Trade Control Schedule, though desirable, does not appear possible of achievement from the results evident from the efforts made so far. In fact the quotation of terms from the Import Trade Control to Customs authorities with reference to doubts on similar entries in the Indian Customs Tariff has not been found to carry the contestant any far. In the case of a local jute mill which recently imported some parts made of wood to it in their spinning plant as a part thereof under the sanction of Import Control Authorities as per entry in the Import Trade Control Schedule the customs authorities at the first two stages rejected the Import Trade Control specification to treat it as wood and to subject it to a much higher rate of customs duty. In another case the import of shoddy woollen blankets from Italy met with the same fate. When in the interior cases of this type come to the notice of the Chamber such instances must be pretty large in port towns. It is, therefore, evident that a revision in nomenclature and in units of measurement and weight in respect of items in the Indian Customs Tariff is called for. This being a technical matter it is suggested that such changes as are to be made in the Indian Customs Tariff from time to time must be consigned to an Expert Committee composed of experts in Customs matters, standardisation and industries.

Question 104.

(i) Raw materials as are not at all available in India but are in use in industries already established here must bear almost no duty while the products of the industry so treated, when imported as manufactured goods from outside, should be subject to a heavy import duty. If there are prospects for new industries and they cannot be established because of the high cost of raw materials and capital goods and from the enquiries of Tariff Commission it is confirmed that there are fair prospects for such industries to thrive. Import Duties on articles in use by that industry which have to be imported must be governed by the same considerations as stipulated above. These stipulations are more important and they should be implemented without loss of time in respect of the industries whose products can pave the way for the exploitation of export markets.

(ii) This is a matter for Tariff Commission to decide from time to time.

(iii) Reduction in import duties to counter smuggling will amount to sacrificing national interests for the sake of criminals. Stringent measures of dealing with those detected of smuggling and honest and vigilant customs personnel can only be depended upon to keep the evil at its minimum.

(iv) & (v) No comments.

Question 105.

The relative use of *ad valorem* and specific duties in the Indian Customs Tariff is satisfactory.

Question 106.

(i) When price fluctuations are not violent tariff values offer themselves as satisfactory bases for the assessment of import duties.

(ii) No comments.

(iii) The existing procedure for determining tariff values must be considered satisfactory. The Chamber will, however, impress upon the Commission the need for a more close and effective consultation with the industries and trades concerned before the determination of tariff values.

Question 107.

Real value as defined and provided for in Section 30 of the Sea Customs Act need not be altered in view of its importance and implications. There are enough powers vested in the Customs Authorities to deal with mal practices, frauds and dumping and undervaluation.

Question 108.

In addition to the suggestions made in Answer to Question 104, materials used for scientific research either by Government or by recognised industries and industrial Associations should be free from import duties.

Materials imported for charitable purposes might be extended the concession of rebate substantially depending upon the charity. But materials imported for humanitarian purposes if proved to the satisfaction of customs authorities and Government should be free from import duties. Articles in category 4 and 5 in the question need not be given any exemption.

Question 109.

The Fiscal Commission when considering this question had touched upon the implications of General Agreement on Trade and Tariff on revenue. Subsequent events have also justified the Fiscal Commission's views on the matter. These agreements do not seem to have affected revenue from import duties in any appreciable manner. Hence revenue point of view need not be given importance in deciding upon Trade Agreements.

Question 110.

Whenever protection is sought to be extended to indigenous industries and enterprise customs duties offer themselves for a better use than import control. No hard and fast rule can be laid. Both quotas and high tariffs might have to be used in case of helping any indigenous enterprise. This is a matter for enquiry by the Tariff Commission from time to time.

Question 111.

The Sea Customs (Amendment) Bill, 1953 fully meets the need for assisting export trade in manufactured goods which involve the use of imported raw materials and therefore the Chamber has no recommendations to make.

Question 112.

No comments.

EXPORT DUTIES.

Question 113.

Whenever there are disparities between the internal and international prices of an exportable item, the former being low as compared to the latter, whenever there is a need for depressing internal prices of commodities for serving internal markets and wherever the commodities that we export are monopoly items without any competition in international markets, export duties could be levied in the interest of the Exchequer.

Question 114.

The Export Advisory Council should constitute a small Sub-Committee of theirs to review changing conditions in the export markets and to recommend adjustments in export duty from time to time. More than anything else quick action is called for in making adjustments or imposing export duties.

Question 115.

No comments.

Question 116.

The Chamber is totally opposed to the participation by the State in import and export trade. Apart from the adverse repercussions any such participation will have in the general economy of the country overall revenue considerations of Government should alone discourage such participation.

CENTRAL EXCISE

Question 117.

In terms of conditions that generally apply to the imposition of excise duties and from the point of view of the opinion expressed by the Taxation Enquiry Committee 1924-25, we must regard the present selection of commodities for the levy of excise duties as satisfactory. To the extent these duties make the price structure of the commodities rigid, they should be considered unsatisfactory in the context of buyers' resistance developing in respect of a commodity in mass use.

Question 118.

(i) In so far as the present rates of excise duty on vegetable oils and cloth appear to press heavily upon the poor, a reduction in the rates of duty may be considered.

(ii) No comments.

Question 119.

No comments.

Question 120.

No comments.

Question 121.

The present arrangements for the assessment and collection of excise in respect of manufactured commodities cannot be characterised as very satisfactory. In the first place serious objection is taken to the insistence on the part of excise authorities in factories having to provide residential accommodation for the excise staff and provision to that effect in the Manual. There

is no correlation between the Excise Inspectors' ideas of the release of goods and the transport made available by authorities. Payments of extras to the excise staff even within law to avail transport placed at the disposal of the factory on the plea of work beyond office hours and on holidays are clearly unjust to the factory having to pay such charges as also the tax. Stock checking and the maintenance of stock card in warehouses and the rules made towards that end are cumbersome and entail the taxpayer, i.e., the factory management to considerable trouble.

Question 122.

The proceeds from excises should go towards revenue. The practice of earmarking a portion of the proceeds of excise for development or for improvement of some other form of cottage industrial effort in the same line is deprecated.

Question 123.

No comments.

SALT DUTY.

Question 124.

Please see answer to Question 35. Yes. Salt duty must be reimposed. Production and imports must be totally in the hands of Government, the duty becoming payable at the point of distribution at sources for sale.

PART III.—COMMODITY TAXES (CENTRAL AND STATE).

Question 125.

Services should not be covered by the taxation on the sale and purchase of goods because this is a commodity tax and not a professional or service tax. Wherever the element of services are mixed up with goods and where these two can be distinctly separated, goods involved may be subject to taxation, leaving the services element free from taxation. In hotel bill, etc., where services and goods cannot be readily separated, there should obviously be no sales tax. Such categories of trade will be few and far between and will not play, anywhere in India, any significant part in sales or purchase tax revenue collections.

Transactions on the sale or purchase in stock exchanges and future markets should not be subjected to any taxation on purchase and sale because they do not constitute sale or purchase in terms of the usual definition of 'sales' (Budh Prakash Jai Prakash vs. Salestax Officer, Kanpur, *vide* 1952, III Vol. STC, page 185). Future markets are intended to act as regulators of commodity market price trends, keeping under check violent fluctuations in ready markets and the business therein does not constitute a business in commodity as such. Therefore anything concerned with commodity taxation must have nothing to do with future markets.

Question 126.

Any tax levied on newspapers will be in the nature of taxing knowledge and education. Newspaper business in India as elsewhere, is not a profitable business in the nature of any other business operation, at least in its initial stages and for years and calls for tremendous initial sacrifice. Circulation of any newspaper accounts for only a fraction of the revenue in newspaper business, advertisements being resorted to in order to make good as much of the current expenditure as possible. These considerations apart, when it is realised that the incidence of salestax on newspaper sales and advertisements cannot be passed on in view of the small price of newspapers and space sales for advertisements cannot bear tax, applicability of salestax mechanism to the sales of newspapers becomes almost impossible. Under these circumstances it is recommended that no tax either on sale of newspapers or on advertisements should be levied and the power conferred on the Union Government in this respect must not be invoked for quite a length of time to come.

When sales and purchases of commodities are taxed, anything done to encourage such sales and purchases by way of services such as advertisements, public relations, market research, etc., should not be taxed. The element of these services will be found added to the price of the commodity which will become the basis of tax.

Question 127.

Sales or purchases taxes cannot be ever replaced by the extension of excises, octroi and terminal taxes and customs. Excises carry with them the elements of protection or restriction on consumption, as the case may be, besides revenue considerations. When an industry requires protection and the consumption tax is also required from the produce of that industry in the interest of revenues, the necessary amount of excise would be unobjectionable only when it is accompanied by import duty equal to the excise duty together with protective duty. Sales or purchases taxes are not taxes on production hemmed in by the above limitations and

that therefore with the extension of the principles of excise, excise duties cannot be made to replace sales or purchases taxes; even in respect of goods manufactured or produced within the State. The levy of octroi and terminal charges to finance local bodies is considered primitive and as offending all accepted canons of taxation. The avoidable complexities and confusion created and the scope it offers for fraud and evasion cannot ever give it the status of a State Taxation. How then can this principle be extended to replace salestax on goods transported into any State from elsewhere in the country? Customs duties all over the world have distinct roles allotted to them in every country's foreign trade, each country being taken as one whole. Factors such as protection, monopoly, international markets and prices, competition, balance of trade and payments etc. are the determinants of custom duties either on imports or on exports. Sales and purchases of commodities within the State have barely anything to do with the above factors. The determinants mentioned above do not have anything to do with sales and purchases. A State does not directly import goods from abroad just as U. P. does not. How can goods imported into the country be apportioned to States on any acceptable basis? Under these circumstances by extending the principles of customs to salestax, sales tax cannot be replaced by customs in respect of goods imported into any State from abroad. Salestax has a specific function to perform as a distinct tax on trade on the State level and it cannot be replaced by the extension and that hotchpotch mixture of customs, excises and octroi and terminal taxes.

Question 128.

(a) Yes.

The criterion of individual sale price as distinguished from aggregate turnover cannot form the basis of sales tax in the context of conditions obtainable in India. That is the precise reason why a purchase tax on the lines of the U. K. Purchase Tax cannot be imposed and levied with success in India. Aggregate turnover must be the only guide for a considerable length of time to come in India for the assessment in each case of sales tax.

(b) There should be separate law of salestax in every State on a uniform basis in respect of all articles which are subject to central excise duties on the lines of such laws at present in force in some States governing sales tax on petrol. The administrative aspect of the problem should be examined and sales tax levied must reach the State where articles are consumed irrespective of who collects it where.

Question 129.

(1) In any system of levy based on turnover, the choice is limited only to the three alternatives mentioned in the question excepting that under single point mechanism under (ii) the registrations can also be dispensed with, the tax levies being confined to the points of sales by either a manufacturer or an importer as is the case in U. P. Transmission tax as in Belgium or Purchase tax as in the U. K. cannot be thought of in the context of turnover as they depend on invoicing and sale prices in respect of every individual item.

(2) The mechanism of taxation on turnover as provided for under (i) of the question 129(1) relating to singlepoint tax is preferable to any other alternative because the ultimate consumers of goods and service can alone be made to pay the taxes by a single shifting of the incidence of taxation on the last leg of the disposal of any commodity. Multi point, besides throwing ultimately a heavy burden on consumers, tends to eliminate several processes involved in the distributive trade, thus sapping services and creating unemployment. Any combination of the first two alternative tends to make legislation in respect of sales tax complicated and leads to widespread discontent and charge against legislature, Government and the tax administration of being partial either to this or that commodity or to this or that class of dealers. Single point system is practically in vogue in U. P. whereunder the points at which taxes are levied are the sales by either the manufacturers or the importers that is at the first leg of the series of sales in the process of disposal and not at the point of sales to the actual consumer of the commodities subject to tax. This system has been found casting avoidable burden on productive activities and manufacturers besides giving place to anomalies such as the impossibility of securing exemption even on legitimate exports out of the State because the exporter happens to be a dealer other than the manufacturer. The producers are called upon to bear the burden of this tax on almost all their purchases used in the process of manufacture or production and also pay taxes on the sale by them of their manufactured goods. The system of single point tax as it is in vogue in U. P. is, therefore, not desirable. This system of taxing under single point mechanism the first leg of the disposal of a commodity, i.e., at the

point of sale by manufacturer or importer is workable and good when everywhere in India, there is a sellers' market in respect of any conceivable goods. In buyers' markets the burden falls inequitably on those that produce or serve distribution.

It must be realised that since multiple turnover tax system takes full effect at every stage of production and trade, it has a strong cumulative effect. It engenders unequal competition between multiple and non-integrated businesses. This principal feature alone calls for confused legislation and rules and orders conceived almost arbitrarily to rectify the position. It also involves more than necessary powers being vested in Government to notify from time to time exemptions, tax limits, etc., etc.

In the single point system, under competitive conditions of trading while the structure and costs of distribution may stand affected, the non-cumulative effect of the tax will not handicap any particular business and discriminate against integrated and non-integrated businesses. The consumers are supposed to bear the burden which will be relatively smaller on the whole under this system though the tax quantum might be greater as compared to multiple point system. Under single point, articles of mass consumption and necessities including raw materials for industries being subjected to *de facto* or *de jure* exemptions inherent in the system itself, luxuries and articles finally entering into consumption may be made to carry a greater load of taxation thus imparting to the system an elasticity denied under multiple point system. In salestax, if properly administered, there should not be any appreciable evasion. By its very nature and due to the fact that an assessee's pocket is not touched and that he merely acts as tax collector for Government, stringent provisions are not necessary. Simplicity of procedure, facilities for compliance, regard for the cost of the maintenance of machinery for collection of and accounting for taxes and an administration charged with honesty and understanding should be capable of keeping evasion at its minimum.

Single point system as enunciated in question 129(1) (ii) offers scope in most of these respects as against any other system of turnover tax. In fact multiple point tax leads to the discovery of ingenious methods for evasion and also results in actual evasions owing to the dictates of business exigencies under competitive conditions.

Question 130.

(1) Yes. Articles of luxury and class use must be loaded with higher burden than articles of necessity and comfort.

(2) Yes. Raw materials and commodities awaiting processing before disposal, even if acquired by a non-registered dealer, must be available tax free.

(3) Water foodgrains, and cereals, oilseeds, medicines, medicinal preparations and drugs, packing materials, books and stationery in use by students and educational institutions, *gur*, condiments, sweets and food sold by *halwais* and hotels, grey and unbleached cloth under certain counts should uniformly enjoy exemption all over India. The sales of all such articles as are deemed necessary to keep alive and clothes mass of the people to a minimum standard should be exempted from taxation because of the poverty of the masses that use them.

Question 131.

In the system of salestax rates, exemption, etc., there should be uniformity all over India notwithstanding the argument that living conditions vary from State to State. It is not desirable to bring sales tax as a whole in the Union List exclusively because of the States enjoying only one major source of tax revenue, which is flexible in character and which can be fashioned according to the needs and economic development of the State concerned. We will advocate the attainment of uniform conditions through constitutional amendments so as to include certain basic matters connected with salestax in the Concurrent List. Rates of sales tax and exemption lists must be as far as possible uniform all over India.

Question 132.

No uniformity has been achieved in regard to exemptions obviously because of non-adherence to one principle governing exemptions and the relaxation that Presidential Order and Parliament's prescriptions give to privileges enjoyed by the States in this matter before 1950. (President's Order No. C. O. 7, dated the 26th January, 1950.) Provisions in clause 3 of Article 286 of the Constitution of India must be extended to all articles which public opinion and Parliament consider as essential to the life of the community all over India whether or not such article or articles had been subject to salestax before the relevant control enactment came into force.

Question 133.

In the light of the findings of the Supreme Court in respect of Article 286(1) and 286(2) of the Constitution of India in the famous Bombay case, the Bihar Government have called upon parties in Bombay State to pay tax on their sales to parties in Bihar. The U. P. Government have similarly called upon parties in Bombay to pay tax on their sales to parties in U. P. though the delivery by the sale of goods had been completed in every sense of that term in the State of Bombay. Many more surprises are in store and assessments dating back to 1950-51 may be taken up now according to the best judgement of assessing officers, for the service of demand notice on parties outside the State's territorial jurisdiction. Cases may crop up in which purchases of goods made by a party outside U. P. after the payment of tax in the purchasing State and brought into U. P. for consumption or use may be brought within the ambit of the U. P. Salestax Act by a literal application of the pronouncement cited above and tax may be demanded of the party that sold or supplied goods in question outside U. P. without any knowledge of its consumption or of the party purchasing them. Bihar Government have served notices on such U. P. dealers as had supplied goods to Bihar parties to get themselves registered under the Bihar Sales Tax Act if the parties desire exemption of their sales on dealer to dealer basis from sales tax under the single point tax mechanism in vogue there. Registration in U. P. under Section 8 of the Act is quite a different matter. It typically concedes power to pass the incidence of the tax on the parties to whom goods are sold on either single point basis or multiple point basis of taxation and to turn over such collections to U. P. Government. Any dealer in any part of India having the off-chance or prospect of supplying goods even once to any U. P. party should, therefore, get himself registered under the U. P. Act if he chooses to pass the incidence of U. P. Salestax on to his purchaser. Variety of complications are thus bound to arise in the future. The limits as to turnover being what they are, where are bound to be several lakhs of assessees to salestax all over India each one or whom has got to deal in each case with no less than eighteen State Governments and each of these State Governments with as many as several lakhs of assessees all over India. This single factor alone is bound to create administrative problem of insoluble nature for every State Government besides rendering business of manufacture and supply of goods somewhat parochial in character in the wake of initial confusion.

While the pronouncements of the Lordships of the Supreme Court in respect of Article 286(1)(a), Explanation attached to the above Article, Articles 286(2) and 304 all read with Articles 246(3) and List II of the Seventh Schedule of the Constitution of India will very likely throw up somewhat confusing and difficult problems at the outset, it has nevertheless to be borne in mind that the principle of territorial nexus underlying the salestax laws of the different States leading to the multiple taxation of the same transaction by different States and the cumulation of burden falling ultimately on the consuming public has been set at naught by this authoritative interpretation of the Supreme Court. This advantage may be found far outweighing the irksomeness and initial difficulties of the dealers having to deal with different State Governments and *vice versa*.

We think that the Commission should go into this question in all its perspective and keeping in view the essential ingredients of the transactions being subject to tax only once in one State, should examine the possibility for minimum changes in the relevant provisions of the Constitution to obtain the desired ends in view. In the meanwhile, in order to obviate administrative difficulties arising out of implementing the provisions contained in any Sales Tax Act with regard to sales made outside or stock of goods having entered the State in question for consumption there, and to avoid the confusion of having to call dealers outside the taxing state to comply with the provisions of the Acts the desirability of every Salestax Act of every State containing provisions on the line of Section 18 of the Bombay Sales Tax Act with suitable modifications as acceptable to each State may be examined.

Question 134.

Yes. See the answer to Question 133.

PART III.—COMMODITY TAXES (CENTRAL AND STATE)

STATE EXCISES

Question 135.

(a) Please see answer to Question No. 35.

Prohibition, partial or total, specially in respect of alcoholic liquors has been of doubtful benefit and success. While this policy of prohibition has occasioned losses to the tune of about Rs. 30 crores to two of the eighteen States of India, the actual loss to all the States which

in some form or the other relinquished this revenue and the loss of the potential possibilities for revenue would be considerable. U. P. Government have admitted that their prohibition has almost been a failure. Cases in other States cannot be any better. Illicit distillation and bootlegging have become common features in most places. In spite of the heavy expenditure on the enforcement of prohibition the availability of liquor has not lessened. One requires only the money to buy it. Something beyond the quantum of what would have been the excise duty goes to the pocket of the racketeer. Corruption and crime is encouraged more by prohibition than by the drink evil. Further when it is realised that this excise is to secure prevention in consumption as far as possible, only way open is to raise the excise duty to make consumption of alcoholic liquor or drugs prohibitive. At a time when development expenditure calls for the utilisation of every possible resource it is not wise to go by sentimental dictates and the illusion of securing social reform.

(b) In so far as the Constitution of India permits the Centre to levy excises on toilet and medicinal preparations, there should be uniformity all over India, in the levy of excise on alcohol and rectified spirit used in these preparations. The States may, however, collect and utilise these duties. This should be achieved through Central Legislation in this respect by Parliament.

GENERAL

Question 136.

Except in the case of export duties no case can be made out for vesting in the administration the power to alter by executive order any rates of any duties. Even in the case of export duties, changes in rates by executive order should be effected at the Cabinet and Presidential levels and the same must be confirmed by Parliament when it meets after the change had been effected.

Question 137.

Commodity taxation does not offer any field for extension in the present circumstances. Five Year Plan if it really secures the standard it promises should be able to account for better returns from the existing fields of commodity taxation.

Question 138.

No comments.

PART IV.—AGRICULTURE INCOMETAX, LAND REVENUE AND IRRIGATION RATES AGRICULTURE INCOMETAX

Question 139 & 140.

There has no doubt been a vast shift of income towards agriculture sector for the last ten years consequent upon a much greater proportion of increase in agricultural prices than in the prices of manufactured commodities. With direct taxation such as land revenue and agricultural incometax, the latter wherever they have been introduced, not having yielded to expansion as taxes on income in sectors other than agricultural all these years, the incidence of tax in the agricultural sector has been much lighter than in other sectors. When it is realised that the percentage of consumption of the articles bearing customs duties and sales tax in the agricultural sector is almost negligibly small, it is evident on the whole that the contribution of agricultural sector by way of tax revenues in India is totally inequitable. Schemes of development under the Five-Year Plan and a major share of total investments therein relate, and very rightly too, to the agricultural sector. Canalisation of income to those that can neither save nor invest in the above circumstance does not appear sound. It is in this context that all taxation measures in this sector have to be viewed. Agricultural incometax, wherever they are imposed at present, are not likely to account for any elastic and progressive income to the States concerned owing to Land Reforms, Zemindari Abolition, a tendency towards the fixation of ceilings to agricultural holdings, land gift movement, the outlook for a recession in agricultural prices, difficulties inherent in the calculation of determining agricultural income owing to the absence of accounting and banking habits in the agricultural sector and the mass of agriculturists falling below the minimum taxable limits. The experience of working up this tax system has been only of three to five years in almost all cases and that too confined to only four or five States in India and sufficient data is not available on which to base the future plans in respect of this taxation measure. Since this tax in respect of its assessment and collection is nearer to land revenue than to the Central Taxes on Income and the machinery constituted for it, the question of Centre taking over the assessment and collection of this tax on behalf of States does not appear either desirable or feasible. This apart when it is considered that there is no uniformity either in systems of agriculture and agri-

cultural produce or in the prices and disposals of agricultural produce all over India, it becomes extremely difficult to think of treating agricultural incometax ever as a subject for the Concurrent List, powers being taken by the Centre to determine the rates of levy and assessments and collections. The nature of agriculture incomes are quite different from other incomes and any co-ordination cannot therefore be possible though one can be correlated to the other. Yet the need for a single co-ordinating authority to assess taxable income from whatever source agricultural or otherwise cannot be over-emphasised. Land Revenue which touches the agricultural sector more extensively than any other tax in that domain will be found to have some basic considerations in all States common to agricultural incometax also. From this point of view too, it will be found undesirable to centralise or semi-centralise this measure of taxation. Informal approach on the part of Centre appears to be the only way out. The U. P. Agricultural Incometax Act, U. P. Act III of 1949 as amended up to date appears to offer some solution to the difficulties enumerated. All the States in India should be asked to expedite legislation on that model with variations to suit local conditions and Agricultural Incometax should be in operation all over India. The Central Ministry of Agriculture & Food should constitute a Central Price Board to correlate and co-ordinate the Agricultural costing and pricing methods in the different States of India and should in due course evolve formulae applicable to the determination of net agricultural income in respect of every state in India. Agricultural Incometax Legislations may take into consideration such formulae. Non-agricultural income should be taxed as at present by the Centre and a liaison must be established between the Incometax machinery and Land Revenue machinery in States to help each other in avoiding evasion.

Question 141.

With the exemption limit for agricultural incometax at Rs. 3,000 net income, it can be expected that the illiterate villager or a small holder will not come within the purview of the Agricultural Incometax Act and that those liable to this taxation are capable of accounting for their income and expenditure. Though there may be no accounts habit in rural areas, the determination of certain major trends in agricultural revenue and costs should not be altogether impossible for application to those that have no accounts at all of their operations. In cases where accounts are not kept and produced before the assessing authorities the income may be deemed to be such multiple of the rent of land determined for land revenue purposes as fit in with the local economic conditions of the State concerned and the general nature of crop produced, e.g., commercial crops, food crops or a combination of both. Provision has, however, to be made for exemptions in case of natural calamities such as failure of crops, etc. In calculating exemption for calamities possible variations from normal crop and the translation of the same in terms of area sown and reaped should be the basis. It has, however, to be borne in mind 'no loss' years are exceptional and rare and that, therefore, only that loss which is in excess of normal loss should be considered. In cases where returns are duly filled in and accounts are maintained and submitted, the gross value of the crops in terms of sale price may be arrived at and from it may be deducted all amounts actually paid by the assessee (a) ploughing and hoeing, (b) sowing including the cost of seed, (c) weeding, (d) watering and irrigation, (e) harvesting and thrashing of crops, (f) making the crop fit for market, (g) transport charges (in case bullock carts and other transport medium are maintained for this purpose the cost of maintenance thereof plus depreciation charges), (h) manuring and the cost of manure actually purchased, (i) customary charges paid in cash or kind to artisans for service on land, tanks, walls, agricultural implements, etc., (j) depreciation on equipment and agricultural implements at a reasonable percentage not exceeding 10 per cent. for their capital value, (k) depreciation on livestock used in agriculture and transport not exceeding 20 per cent. of gross investments therein, (l) depreciation on the means of irrigation, walls, building, etc., not exceeding 5 per cent. of their capital value, (m) land revenue and local rates paid in the preceding year, (n) crop insurance premia paid if any, (o) rent and other irrigation dues paid specially to secure means for agriculture in the land concerned, (p) interest on borrowings, if any, if such borrowings had been spent exclusively on land and land improvement and interest on mortgages, if any, arising out of the land ownership and exploitation.

Exemption for calamities may be given in this case also as indicated earlier.

Wherever both the above ways of determining taxable income for agricultural incometax purposes are found inapplicable after thorough enquiry and for valid and understandable reasons, 50 per cent. of the gross value of the crop as represented by the market price thereof when it gets ready for disposal may be allowed

s deduction to determine the net income for assessment and in doing so loss arising out of calamities might also be considered.

Question 142

The following rate of Agricultural Incometax are suggested for adoption by all States in India on a uniform basis.

The following rates are subject to the conditions that :

- (a) no agricultural incometax shall be payable on a total agricultural income which does not exceed Rs. 3,000, and
- (b) the agricultural incometax payable shall in no case exceed half the amount by which the total agricultural income exceeds Rs. 3,000.

In the case of every individual, Hindu undivided family, Muslim waqf, firm and other association of individuals, not being a Company, the basic rates of agricultural incometax may be as follows:—

	Rate
1. On the first Rs. 1,500 of total agricultural income	Nil.
2. On the next Rs. 3,500	One anna in the rupee.
3. On the next Rs. 10,000	One and a half anna in rupee.
4. On the next Rs. 10,000	Three annas in the rupee.
5. On the balance	Four annas in the rupee.

In the case of a company, agricultural incometax shall be payable on the whole of the agricultural income at the maximum rate of four annas in the rupee.

In the case of every individual, Hindu undivided family, Muslim Waqf, firm and other association of persons not being a company the basic rates of agricultural super tax shall be as follows :

	Rate
1. On the first Rs. 25,000 of total income	Nil.
2. On the next Rs. 10,000	One anna in the rupee.
3. On the next Rs. 10,000	One and a half anna in rupee.
4. On the next Rs. 10,000	Two annas in the rupee.
5. On the next Rs. 10,000	Two and a half annas in rupee.
6. On the next Rs. 10,000	Three annas in the rupee.
7. On the next Rs. 15,000	Three and a half annas in rupee.
8. On the next Rs. 15,000	Four annas in the rupee.
9. On the next Rs. 15,000	Four and a half annas in rupee.
10. On the next Rs. 30,000	Five annas in the rupee.
11. On the balance	Five and a quarter annas in the rupee.

In the case of an association of persons being a co-operative society for the time being registered under the Co-operative Societies Act, 1912, or under an Act of the Provincial Legislature governing the registration of Co-operative Societies :

	Rate
On the first Rs. 25,000 of total agricultural income	Nil.
On the balance	Two annas in the rupee.

In the case of every company:

On the whole of total agricultural income Two annas in the rupee.

A convention has to be developed through persuasion by the Centre in this respect. Constitutional changes to secure uniformity in rates are not recommended.

LAND REVENUE & LAND CESSES

Question 143

Yes. In the absence of reliable data regarding agricultural crop production and prices and also owing to the lack of accounting habits in the village communities, the more reliable system of basing land revenue on net produce has to be abandoned in favour of periodical settlements whereas variety of misleading factors are forced to be taken into consideration. The

period of settlement varies from 10 years to 40 years in the different States of India. This long spell of time between settlements are intended to secure for the agriculturist the advantages arising out of better prices in the period and permanence and a sense of security with regard to his returns and obligations. If we take the rise in prices of agricultural commodities during the last ten years and the settlement operations once in 40 years as in U. P. together we will find that much that has been legitimately due to the U. P.'s Exchequer from the agricultural sector had been lost and in its place other sectors had to be squeezed. Nevertheless the present system of land revenue in India can be cited as hardly recognising the limit of taxable capacity and satisfying any of the canons of taxation.

Question 144

There is no other alternative but to depend upon land revenue on the basis of periodical settlements. Period of guarantee should not be more than 10 years and should be uniform all over India without legislative pressure from the centre. A fixed assessment based on wholesale prices of crops usually grown in the area for the last ten years on a weighted basis and yields thereof and guaranteed for a specific piece of land would be better than the fixation of basic rate with variations. Abnormal depression in agricultural prices and booms therein may be covered by remissions and surcharges determined on the basis of set principles. Land revenue should not be depended upon to provide incentives to production and shifts in production. Natural economic trends must be allowed to determine shifts in agricultural production. Incentives to production must be provided by economic prosperity and accelerated demand for agricultural produce both internally and from outside India. Assessments of small holdings of land below the standard minimum for revenue demand may be on the basis of payment in kind with permission to commute such dues into cash at any given time. But this facility must be limited and allowed only in exceptional cases under exceptional circumstances.

Question 145

Annual value must form the basis of resettlement. This value should be the gross produce less cost of production including the value of labour spent by the farmer and his family on the holdings concerned. Certain principles must be arrived at after a thorough enquiry into the agrarian economy in each state and these principles must come up for uniform application in every State in respect of this matter

Question 146

Surcharge on old rates based on crops grown, size of holdings and the wholesale prices of those crops in well definable regions appears to be the only alternative enforceable to bring old rates into conformity with changed conditions wherever resettlement is overdue but cannot be completed for administrative or other reasons. Certain amount of disparity is bound to crop up but the same could be corrected by the basis recommended for the determination of the surcharge.

Question 147

See answer to Question 146. No further comments.

Question 148

From the experience of Zamindari Abolition in U. P. whereunder the old tenant-occupier has now become the owner of the land will pay Land Revenue which the Zamindar was paying on that land to Government direct and has acquired the ownership by paying ten times the annual land revenue in lump sum wherewith to pay and compensate the Zemindar, it appears possible to visualise tentative arrangements pending the completion of survey and records and the consequent assessment.

Question 149

No. Co-operative farming need not be given any special performance in the matter of land revenue when other facilities are available for exploitation by Co-operative Societies protracted very much under law.

Question 150

No comments.

Question 151

If agricultural land in rural areas is used for non-agricultural purposes such land cannot obviously be assessed on the usual basis for land revenue. It has to be reassessed with reference to the use to which such a land is sought to be put and the principle of 'what the traffic can bear' should be brought into application. Land classed as agricultural but now part of an urban area must be assessed and leased out as *Nazul* lands in U. P. are assessed and rented out. The revenue from this source should be solely Municipal. Land classed as non-agricultural whether in rural areas or in urban areas and used for non-agricultural purposes must be

subject to property taxation in vogue in the area and the revenues, therefrom should belong to the local body concerned.

Question 152

No comments.

Question 153

See answers to Question 189 to 194 and 200 in Part VI of the Questionnaire.

Question 154

Land cess should be a certain percentage or expression in terms of annas to a rupee of the annual rent value of land. The rates should be flat and no graduation thereof is recommended for adoption at present. These cesses must be assessed and collected by the Land Revenue collection machinery and made over to the respective local bodies from whose jurisdiction such collections are made. These cesses should be earmarked for building and maintaining roads and communications.

IRRIGATION RATES & BETTERMENT LEVY

Question 155

People who benefit from the improvement in land through irrigation or other projects must be made to pay a fair share of such improvement by carrying the burden over a number of years. Though the entire cost of any such development project cannot and should not be expected from the immediate beneficiaries and the general tax payers has to bear a portion of the burden, it should be possible for the immediate beneficiary to pay the interest charges on capital outlay and maintenance expenditure on such development works. Since water alone cannot increase the productivity of soil and full advantage of development and water supply can be taken only with additional investment of capital and since with the provision of water, the land values in the area move up, it will be in the fitness of things if a small compulsory cess for all lands under command in the developed area whether the water is actually utilised or not as a general betterment tax is levied this cess being a small fraction of land revenue realised in that area or block. In addition, the irrigation rate for water actually supplied may be charged from owners of lands where such water is used. This betterment levy should, however, be earmarked for irrigation development and must not be taken over to general revenues.

Question 156

Twentyfive percentum to forty percentum of increment in land value consequent upon development and irrigation may be absorbed by the State as betterment levy. The percentum of such levy will depend upon the needs of the State and general economic considerations obtainable there. The annual rental value of land on which land revenue has been leased may be roughly taken as 3 per cent. of the cost of land and the original value of land may thus be arrived at. Its market or saleable value after improvement had been effected might be determined by expert valuation after taking into consideration crops grown, increased productivity of land, prevalent prices of such crops, prospects for further acceleration in production etc. From the latter might be deducted the former and this will be the total increment in the land values in that area or block. Canal Department must be made responsible for the collection of this levy with the co-operation of land revenue collecting agencies. This levy must be spread over a sufficiently long period for realisations in case the property is not marketed or sold after improvement has been effected and betterment levy assessed. In the case of sale or disposal otherwise but not on transfer by legal succession, the entire betterment tax due must be collected from the seller making the buyer also responsible for payment should the seller fail to clear the dues. It will not be improper and it should not be impracticable to impose and levy betterment rates on lands already benefited by an existing irrigation work. Probably some exceptions might have to be made in this case in respect of sales at higher values having already been effected before betterment levies are imposed. The levy in this case must be earmarked for development purposes and must not go to general revenues.

Question 157

(i) Irrigation rates should be no more than an adequate charge for water supplied in the context of proposals contained in answers to Questions 155 and 156.

(ii) Area irrigated and quantity of water supplied should form the bases for irrigation rates.

(iii) Water rates must be revised periodically with special reference to the cost of maintenance of works and interest charges over every five years.

Question 158

See answers already given.

Question 159

In proportion to the advantages offered by mine work or a tube well scheme betterment levy irrigation rates and irrigation cost should be capable of being adjusted and consolidated into one whole as a surcharge on land revenue.

Question 160

Please see answer to Question 159.

Question 161

No comments.

PART V.—OTHER TAXES (CENTRAL & STATE).

Stamp Duties and Court Fees

Question 162 & 163

Stamp duties are in the nature of taxation though for the most part they relate to the conferment of legal rights on documents thus imparting to such duties, the character of a specific service and function. The incidence of this tax falls mostly on persons who are parties to transactions relating to considerations of value. Within certain limitations, therefore, these duties may be levied on *ad valorem* basis. Stamp duties should not, however, be so excessive as to retard business and to tempt persons who ought to pay them in their own interests, to resort to evasion, both legal and illegal. The powers enjoyed by the Centre in the Union of India under our Constitution to fix the rates of Stamp Duties in respect of bills of exchange, cheques, promissory notes, bills of lading, letters of credit, policies of insurance, transfer of shares, debentures, proxies and receipts clearly show the tacit admission of the fact that the stamp duty should not only be uniform in respect of rates all over India but also be covered by a single pattern of administrative thereof. Stamp duties are one of the most convenient methods of raising revenue through taxation though their potentials are limited and it is this factor alone that outweighs the general disinclination of economists to justify this tax. Conferment of powers on the State to fix the rates of stamp duties in respect of most of the transactions not covered by the Central List was found presumably necessary to enable the States to meet the varying needs of revenue and the economic conditions thereof and to mutually reconcile both these factors in the determination of the rates of stamp duties. Nevertheless this arrangement of the division of powers and responsibilities for the determination of stamp duties between the Centre and the States and of the placement of revenue from stamp duties in the Concurrent List in the Seventh Schedule of the Constitution causes considerable inconvenience and hardship to everyone who has an instrument to execute under law in one State in respect of things or matters in another State where the Stamp Duty is lower in one State and higher in the other. Similar difficulties will be found to arise where the instrument to be stamped covers properties and for things done or to be done in two or more States all over India. It is, therefore, suggested that all stamp duties other than judicial as covered by the Indian Court Fees Act should be a subject matter for legislation by the Parliament for the whole of India in so far as the fixation of rates and the collection of revenue through Stamp Duties are concerned. The revenue should go to the States and not the Centre. Paragraph 282 in the Report of the Indian Taxation Enquiry Committee 1924-25 (Todhunter Committee) detail out the general principles that should govern the fixation of the rates of Stamp Duties as follows:—(i) the point at which the value of the convenience or utility attaching to the use of a particular type of document or the resort to a particular kind of transaction approaches the amount of stamp duty involved, (ii) the point of diminishing returns (in other words, what the traffic will bear), (iii) the point at which hardship on any class of the community is involved. These principles will be found apt for application in India even to-day. Since revenue from 'Stamps: Non-judicial' does not form a significant proportion of revenue from stamp duties in almost all the States and since 'Stamp duties' levied under the Indian Stamp Act should not be stretched to correct even partially monetary maladjustments, the central station of this duty in so far as it relates to non-judicial items will secure more advantages than occasion any real loss of revenue. The present rates of stamp duties on items on the Central List should be retained without alteration for the whole of India. Schedule 1A inserted in the Stamp Act by Section 12 of the U. I. Act III of 1936 may be considered satisfactory in the light of the present revenue needs of almost all the States in India and may be incorporated in the Indian Stamp Act Schedule I for application all over India. In view of the fact that most transfers of shares and

ocks are effected under a system of blank transfers and the legitimate duty is thus avoided and that this system of blank transfer cannot be done away with in respect of the dealings in stocks and shares, it may be provided that every contract covering every transaction

the Stock Exchanges shall be duly stamped on a uniform basis all over India and in this the active operation of the Stock Exchange Authorities might be sought. This should not prove difficult in the context of the Commission on Futures' Markets having come to existence to regulate in India, the futures' markets on a rational basis. Excepting stock exchange transactions or transactions otherwise also through genuine transfers of shares, stocks and securities, all transactions in futures including specific delivery contracts could be subjected to salestax (turnover tax) on the basis of a consolidated rate per centum of turnover and the co-operation of the regulated futures' exchanges must be sought in this respect. It is hoped that with the strict enforcement of regulations governing the conduct of forward and futures' markets in India under the aegis of the relevant Commission these Kerb transactions or street gambling in futures will cease and even if they exist they will do so under the risk of penalty for gambling. Stamp duties cannot and in principle should not be applied to transactions in futures markets excepting Stock Exchanges. In the above context the operation of one single stamp Act for the whole of India (and not one Courts' Fees Act for India) should not be considered as not feasible.

Question 164

No. Salestax based on turnover is not a transmission tax based on invoices as in Belgium. It is neither a purchase tax again based on invoices as in the U. K. and as long as accounts only figure in the determination of the turnover and not a type of document, the process of collecting revenue through stamps cannot be enforced. Since entertainments are based on tickets of admission to the places of entertainment, the Stamp Act easily becomes applicable here.

Question 165

Underestimating the value of considerations involved in conveyances and other transfers of property, the substitute use of Promissory Notes and Bills of Exchange for Bonds, the advantage taken of lower duty by treating a settlement as gift, wilful undervaluation of property for the purposes of deeds of partition and Blank Transfers in transactions relating to stocks and shares and securities are some of the most common methods of evasion of Stamp Duties in India. The use of powers already vested in official machinery with discretion and the refusal of Courts to admit as evidence understamped documents will mitigate evasion to a considerable extent. Review of duties from time to time on the general principles outlined in Answer to Questions 162 and 163 and the fixation of rates so low as to make evasion unremunerative but the yield of overall revenues progressively better is another method of tackling the evasion of stamp duties. The provisions of Indian Stamp Act as adopted by the different States are still unknown even among the educated. The judicious execution of provision contained in Section 78 of the Indian Stamp Act (Act II of 1899) might go a long way in this direction. Evasion arising out of ignorance can thus be avoided.

Question 166

Court Fees are different from Stamp Duties in that Court Fees cannot be treated as a tax, general revenue considerations having any bearing on them. The guiding principle of Court Fees is the special payment for a specific service of special reckoning in each case between the authorities and the contributors. The revenue from and the consequent levy of Court Fees must, therefore, depend upon the cost of service in providing for the administration of Courts, justice and attachments thereto such as jails and police involved in that process. The cost of providing judicial machinery in any State will appear to depend upon the areas, population, economic set-up and the potentials for and latent economic activity including the State of Education and standard of living. These conditions vary from State to State very markedly and the differences in the rates of Court Fees are, therefore, bound to exist. We do not, therefore, advocate uniformity in respect of this matter.

Question 167

Answer to this question will depend upon the effective judicial reforms that are being attempted in the country both at the Central and States' levels. In relation to the expenses involved in litigation, Court Fees at the moment as in U. P. do not appear to cast unduly heavy burden. The change in the Schedule is, however, a technical matter to be considered by persons qualified to speak on Court practice and procedure with special reference to accounting processes involved in litigation and related documentations. Schedules to the

Indian Court Fees Act are, however, old having been modified from time to time by every State to suit peculiar conveniences and it, may be said that the same require recasting. Debates in the Legislative Council, Uttar Pradesh in May 1938 when Court Fee Act was being amended throw some light on this question and the arguments advanced in the course of that debate are therefore, not repeated here.

Taxes on Motor and Other Vehicles :

Question 168

It is clear from the Report of the Motor Vehicle Taxation Enquiry Committee, 1950 that the State expenditure on roads in almost every case far outweighs taxes collected from Motor Vehicles and that increasing reliance is placed on Motor Vehicle Taxation by the States as a set-off against their expenditures on roads. Conditions vary from State to State in respect of road communications and use in the context of areas and population. The largest numbers of motor vehicles on road in Bombay and West Bengal States and for its size in the Delhi State do not reflect either the extensive use of roads by such vehicles in those States or the proportionate size in road expenditure consequent upon such road use. The cities of Calcutta, Bombay and Delhi all of which under no circumstances can be characterised as merely State cities made rich and prosperous by the States' resources, will be found to account for most of that number of motor vehicles in use in those States. All such taxation that hinders trade indirectly such as terminal taxes and taxes on passengers and goods carried by motor vehicles should, however, be scrapped if road transport is meant to be encouraged and helped. It is also necessary to aim at uniformity and not centralised collection of State Motor Fuel taxes and the Salestax on motor spirit. Though it may not be possible for Casting the motor vehicles tax into one pattern and size for all the States of India, the aim should be to gradually bring about uniformity in motor vehicles tax. A consolidated tax on motor vehicles does not appear feasible.

Question 169

Motor Vehicles Taxation should not be considered as fees and the implications involved in the levy of fees, the principal among which is that the cost of service must have some bearing on the overall levy, should not be involved in respect of Motor Vehicles Taxation. The recommendations of the Motor Vehicles Taxation Enquiry Committee, which in effect seek to earmark revenues from Motor Vehicles and motor spirit almost in its entirety to road maintenance, judged in the above light, are not as tempting as they would have otherwise been. Any watertight bottling of revenue resources specifically for a purpose might rob the purpose itself of its ability to attract necessary funds. In fact road development and maintenance should depend upon the general economic prosperity which they will generate and all the users of roads must be made to carry the burden of road taxes more equitably than now. The tendency to earmark revenue from Motor Vehicles for road maintenance and development will thus be found self defeating.

Question 170

While agreeing with most of the recommendations of the Motor Vehicles Taxation Enquiry Committee subject to the remarks under Questions 169 and 170, centralised collection of States motor fuel tax and the elimination of salestax on petrol are not considered feasible. The recommendation that with the levy of transport cess as a surcharge on fuel tax the price of motor fuel should be equalised all over India is particularly supported.

Question 171

All users of roads should be subject to taxation according to their economic circumstances and the use they make of the roads without exception of even the cultivators. A small cess or surcharge on land revenue to cover cultivators' carts and State taxation of all bullock carts and other vehicles using roads other than strictly municipal ones are measures that can go to impose equitable burden of taxation for the use of roads on all concerned. Collections from these sources may be made over after deducting collection expenses to the District Boards for the development and maintenance of roads under their jurisdictions.

Entertainment Tax

Question 172

The plea of the Cinematograph Industry Enquiry Committee regarding the incidence of tax falling heavily on the industry cannot be considered as valid. If a scientific investigation of business trends during the periods of depression is carried out and the results are analytically considered industry or tradewise, it will be found that cinema trade and industry keep-on pushing

ahead with concentration in urban areas with evil social effects all the same. It is not to the entertainment tax that depression or stagnation in cinematograph industry and trade could be traced and temporary set backs in cinema industry and trade should not be mistaken for the operation of diminishing returns consequent upon entertainment tax.

The present system of graduated realisation of entertainments tax in U. P. appears to be satisfactory.

Question 173

Educational films having reference to the spread of desirable knowledge among masses and not intended for top classes only and when receipts are sought to be fully applied without remunerating the participants in any show beyond actual expenses to charities approved by Government in writing prior to the show should only figure for exemptions.

Question 174

Though the evasion of entertainment tax cannot be shown to involve State treasuries to any substantial loss of revenue and as helping evaders with any appreciable advantage over those that obey law in this respect and pay the taxes because of the urban character of this tax, it will all the same be found necessary to put an end to this evil of evasion. Evasions mostly occur through complimentary admissions to the places of entertainment without tickets. Entertainments having the character of religious affiliations to them also get confined to classes with restrictive admission, club functions having the characteristic of exclusiveness about them and confined to members but which are nevertheless entertainments are other instances of evasion. These are necessary evils and cannot be altogether avoided. The system in vogue in smaller towns generally and in some bigger centres also of the places of entertainment such as cinemas, circus exhibitions, theatres etc. being treated as places for the free admission of local police and civil officials by virtue of their official positions as a matter of right must be ended before the public mind can be diverted from the evasion of entertainment taxes. All collection of entertainment taxes must as far as possible be by stamps affixed to tickets and complimentary passes or invitations.

Question 175

Licensing of those that hold street shows such as jugglers etc. by the State Government through local bodies and treating such receipts as entertainment tax receipts are recommended. Admissions to exhibitions and amusement parks and the participation in amusement diversions provided in exhibitions and parks unless they are strictly for children could be covered by the entertainments tax.

Tax on the consumption or sale of Electricity :

Question 176 to 180

Any tax on the consumption or sale of electricity is not a good tax and it is not desirable to impose the same. A tax on electric power used by industries, large or small, will be a tax on production making the cost structure rigid to that extent. Electricity is almost a necessity in urban areas and any tax thereon even on domestic consumption will amount to taxing a necessity and the already overtaxed urban resident. Electricity used in agriculture should not be touched for obvious reasons and in the present context of our developing economy. In fact our constant aim should be to generate electric power most economically and to supply the same as extensively as possible almost at cost. In fact the principle behind licensing electric supply undertakings that are privately managed and run, the fixation by public authorities of their rates of supply, limitations in their profits and the constant endeavour to compel them to reduce rates of supply are all based on this main consideration. The increasing pressure for all public utilities specially electric generating and supply undertakings being owned by the State has for its objective the complete elimination of profit motive from such enterprises. All these huge projects undertaken by the State in the Five Year Plan lose all their meaning and significance in the context of tax on electricity. Even the consideration of electricity undertakings contributing something towards general revenues by way of surplus earnings should not, in the economic interest of the community, prevail. Under these circumstances this tax cannot be considered either suitable or just. This Chamber is strongly opposed to the levy of any tax on electricity put to industrial and agricultural uses however necessary it may be to augment the resources of the Treasury.

Betting and Prize : Competition taxes

Question 181

While horse racing may be allowed to continue and flourish, participation therein must be made beyond

the reach of the average man by a heavy load of taxation not only on the admission to the place of races but also on bettings in totos and bookmakers' booths. All manner of betting on horse racing outside the race course anywhere should be, if detected, severely dealt with under law and treated as gambling. That is the only way in which evasion here can be avoided.

Question 182

Betting must not be extended any further and the extension of betting tax is, therefore, out of consideration.

Question 183

Prize competitions such as crossword puzzles, call for a more rigorous control and not only every entry should be taxed but the prizes distributed should also be subject to tax. These competitions should be duly licensed by the State Governments and their conduct governed by legislations and prescribed rules almost uniform in nature all over India. All the entries to the competition and decision of prize winners should be subjected to the scrutiny of the taxing authority and the public. Unlicensed or *ad hoc* competition should be severely dealt with under law as gambling and public deceit.

Question 184

Please see a separate Memorandum prepared by the Chamber on the subject of cesses and other taxes not covered by the Questionnaire.

PART VI.—LOCAL TAXATION

Question 185

The system of local taxation in India cannot be considered unsatisfactory in the present context of our development. It is difficult to agree with the contention of the Local Finance Enquiry Committee as raised in paragraph 83 of the Report thereof that the financial resources of the local bodies are inadequate. In support of the above contention the Committee rely on figures of *per capita* contribution and the incidence of taxation on rural income without considering whether or not existing powers given under existing statutory arrangements to raise the necessary revenue has been judiciously and fully utilised. Civic consciousness and advanced sense of responsibility, which are conspicuous by their absence almost everywhere, are called for in the community in respect of its imposing high taxation on itself for the common needs. Unconditional extensions of grants-in-aid have been to a certain extent at the bottom of such a complacent outlook. Instead of tracing the inadequacy, if any, to our own inefficiency and lack of civic consciousness, blame is at once thrown on the Constitution and devolution. The need for improvement is, therefore, confined to matters of relative detail and administrative adjustments. It cannot be seriously argued in the present state of our development and administrative equipment that there is no need for control by the State Governments over Local Self-Government authorities in the matter of taxation and budgeting. Financial resources for local bodies must increasingly come out of continuously developing areas over which they have jurisdiction in order to account for a progressive economic improvement. Unless all the existing avenues permitted by our Constitution and Statutes are fully tapped and appropriately used and the fact thereafter demonstrated that the resources are inadequate to account for improvement in a comparable way or according to a determined target, it cannot be held that the system of local taxation is in any way unsatisfactory.

Question 186

The recommendation of the Local Finance Enquiry Committee that terminal taxes on goods or passengers carried by Rail way, sea or air should be transferred from the Union List to the State List in the interest of the devolution of powers ultimately on local bodies to provide them with an additional resource of finance cannot be supported as the said Committee do not appear to have given this matter the consideration it deserved before it made this recommendation. This levy is in the first place an abnoxious one on the trade and commerce of the country. It is, therefore, only reasonable that the Union Government which regulates Industries and Commerce within and without should be the sole judge as to whether this abnoxious interference with the free flow of Commerce and Trade should at all be permitted. Secondly this tax will be found touching the administration of railways, shipping and airways which are all under the control and jurisdiction and mostly under the management of the Union Government, State Governments or Local Bodies cannot be relied upon to take all factors into consideration in permitting or disallowing these levies. This Chamber's negotiations with the Railway Administrations concerned and the Railway Board on behalf of the Kanpur Municipal Board in respect of the collection of this tax

when the Railway administrations concerned washed their hands off this matter fully brought out the inadvisability of entrusting this source of taxation to either the State Government or to local bodies through them. Thirdly the scope this tax offers for corruption unless centrally managed and collected at source by the Centre is so wide that the very vitals of civic consciousness and responsibility are sapped by the poison it generates. Hence the transference of this item to the State List is not warranted. With the savings provided for in the Constitution in respect of the continuance of such levies if they existed prior to the date of the enforcement of the Constitution and the obligation imposed on the Centre to hand over the proceeds of this tax to the States concerned, no serious objection can be taken to this entry in the Union List. Only under grave emergency and that too in unavoidable circumstances, this provision should be invoked with the help of the good offices of the State Government and the Centre must be asked to sanction levy and all this only for a limited period.

Question 187

The presence of the element of payment for services rendered in a more conspicuous manner characterises local taxation all over the world. The tax demanded in the case of local bodies must, therefore, bear a close relation to the services which that local body seeks to render to the population within its jurisdiction. What may be an inescapable need in the case of a particular group of people in a particular locality, may prove to be a luxury to the other group in other locality and the capacity and inclination to pay for the same type of services in respect of both such localities may violently differ. Further the cost of a service may be smaller in one locality as compared to the cost of the same service in another locality. In the event of the need of the same service in both the localities, one will be called upon to pay more than the other by way of tax contributions for the same service. The state of economy of the locality, the potentials it has for progress, the contribution that the services rendered by the local bodies towards the progressive improvement in the economy of the locality and the extent of consciousness in community welfare and civic obligations should be the basis for the determination of local taxation. Judged in the above light the functions of city corporation may be found to cover services, both extensively and intensively, that touch the life of almost every citizen in its varied aspects and have a bearing on the economy and prosperity of the Corporation area as a whole. The provision of water, electricity, gas, transport and such other services either by the Corporation itself as Municipalised services or through other private agencies and the maintenance of these services in continuity and efficient state may be earmarked as the responsibility of the Corporation. These services could under certain circumstances be made paying propositions in that their net contribution to the revenues of the Corporation may be appreciable and such as to keep the need for taxation at the lowest possible levels. These services must, however, be made to pay their own way by those using them and taxes ought not to be used either for the provision of these services or for their maintenance. These civic amenities are in addition to the provision of basic and elementary civic needs such as roads, sanitation and health, parks and places of amusements, education etc., which are common for almost all local bodies. The amenities and services provided by the City Corporation are so varied and all-embracing that it caters to almost every needs of citizens within its jurisdiction. These amenities and services have a direct bearing on the economy of this locality covered by the Corporation and the productivity of the population thereof. Though in relation to the sum total of amenities and services and their values, the expenses may not be considered high, the *per capita* contribution of the citizens towards these services must figure higher than that of any other type of local body. The facts that such contribution are correlated to the earnings (the average earning of the person living in a Corporation Area is far higher than that of a person living in other areas, and productivity of the residents of the area covered by the Corporation and that the amenities and services provided for are conducive to such earnings and productivity cannot be lost sight of. The taxes or fees permissible for levy and the discretion extended to the Corporation in the matter of taxation need not and should not be extended to Municipalities which cater to the needs of a population in different economic set up and size and whose contributions cannot be of the same order as those of the Corporation. In the state of economic progress we are in and the need for almost everything that goes to make the fundamentals of living necessary, our Local Boards and Village Panchayats have yet to battle with the provision of limited amenities such as wells and village sanitation, primary education, local markets, local roads, etc. to the extent of making rural areas economic and productive conscious. These bodies, cannot, therefore, be

thought of in terms of Municipalities or Corporations. Just as Municipalities and Corporations pay their way these bodies must pay their way for the most part through contribution from local resources. Their resources cannot be elastic unless their economic progress is such as to impart elasticity to the sources to their revenue. The proportion of non-tax revenue to total revenues ought to be greatest in the case of Corporation, lesser in the case of Municipal Boards and Town areas and almost nothing for the present in the case of District Boards and Village Panchayats, the last named bodies being obliged to depend upon meagre resources of tax revenue for the present.

Question 188

The framework of local taxation in most of the States in India is defective in that while the initiative in regard to the proposals for taxation for the most part lies with the local bodies the power of sanctioning such proposals lies with the State Government and that in this process of taxing the responsibility gets blurred. While there should be an around control by the State Government over local bodies including City Corporations and power in the State Government to levy taxes allocated to and capable of being imposed by local bodies in the event of the failure of the latter to act with a reasonable measure of success being inherent in such an around control, all local bodies should have independent powers of taxation subject to the minimum and maximum limits in each case to be prescribed by State Legislation. The absence at the moment of this feature in Uttar Pradesh accounts considerably for the dilapidated finances of local bodies.

Question 189

Encroachments, which may be considered too many and beyond the capacity to bear, have been made in respect of taxation, direct and indirect, by the States and Central Governments with the result that not only persons but also commodities are called upon to bear burdens beyond reasonable limits dictated by the current economy of the country. These superior authorities are also extremely jealous of the exercise of any of their powers by any local authority. It is more often never realised that the requirements of a metropolitan city area, like Kanpur for instance, can, not always be met by strict adherence to the field which is indicated for municipal authorities to raise money from and that the contribution of such a metropolitan city area to the States and Central revenues by way of taxes alone is a sizeable fraction thereof. Under abnormal circumstances as the ones under which a city like Kanpur might be shown to be placed, devolution of a fraction of indirect taxes like the sales-tax and direct taxes like the income tax temporarily and for sometime upon a local body like the Kanpur City Corporation (yet to come into being) will indeed be found helpful. Devolution of entertainment taxes upon Municipal Boards in general, of the surcharges on stamp duties and Estate Duties and Agricultural Income-tax upon District Boards and Village Panchayats are instances of taxes raised in this question.

Question 190

The levy of octroi on goods carried by road and terminal taxes on passenger and goods carried by Railway, sea or air are instances of unsuitable taxes devolved on local bodies generally such as Municipalities. These taxes hinder the growth of industry and commerce on natural foundations and stultify trade. This is a primitive form of taxation giving plenty of scope for evasion and necessitating a complicated and unremunerative administration. Diminishing Returns set in sooner here than in any other form of taxation. Yet these taxes are still there.

Question 191

Yes. Even though Section 145 (1) of the U. P. Municipalities Act permits revision in the assessment before the lapse of a given period between two assessments, yet the U. P. Government and the Municipal Board's interpretation of the section otherwise to mean the possibility of revision once only in five years does not impart promptness and flexibility to a suitable category of tax. In spite of Section 128 of the U. P. Municipalities Act, the imposition of tax on trades and callings become difficult when resources are most needed by the procedure to be adopted in obtaining sanctions. Instances can be multiplied to show how Commissioners and District Magistrates having not the time or equipment to adjudicate upon such question delay unnecessarily considerations of proposal put before them towards such ends.

Question 192

Yes. See answers to Questions 190 and 191.

Question 193

(a) In Uttar Pradesh while the powers to decide whether or not to levy the tax and to determine the

rate of levy are not devolved upon local bodies excepting in rare circumstances powers to assess and collect tax have been fully devolved on them subject to the limitations imposed by the State Government in the matter of any particular tax and its rate of levy.

(b) Please see answer to Question 185. In the U. K. in the case of local bodies if the actual collection of tax is even 95 per cent. of budgetted revenue under that head enquiries are immediately set afoot to trace the weak spots. In India even 60 per cent. collection in the case of local bodies is endured with complacency. Maintenance of standard of collection has to be more closely looked into.

(c) In the present state of civic sense literacy and the resources for the management of local bodies a correct answer to this question from correct perspective capable of helping in the consideration of the issue does not appear possible.

Question 194

No comments in view of answers already given.

Question 195

(a) There is a considerable lack of co-ordination between the local taxes themselves in respect of Municipalities in the U. P. and this lack of co-ordination is carried further between these taxes and allied States' taxes and Central taxes. A case in point is the levy of Octroi in Allahabad, Banaras and other Municipalities and terminal tax in Kanpur and Lucknow Municipalities, the former on an *ad valorem* basis and the latter on a specific basis dependent upon weights and measures. Commodity taxes at the State level such as salestax where value as represented by sale price is the determinant and central excises on commodities produced in U. P. such as cloth and sugar on the basis of weights and measurement can apparently have no established co-ordination with local taxes specified above. The assessment of when and how diminishing returns start operating in respect of each one of all the above taxes becomes well nigh impossible. That all these taxes affect only trade and commerce and that too adversely cannot be denied. In a totally sellers' market and under conditions of super-imposed State controls perpetuating artificial shortage any illogical combination of these taxes without co-ordination does not show up the evil effects of anyone or all these taxes. But in the circumstances of free competition, private enterprise and buyers' markets their marked evil effects appear in direct proportion to buyers' resistance and the rigidity of cost structure. Much more is lost on swings than is gained on rounds in the matter of commodity taxes local, State and Central. The remedy will be found to lie in the use mostly of direct taxes and service fees inducing surplus revenues from public utilities for financing local bodies rather than indirect taxes affecting commodities.

(b) Most certainly yes. Even a small retail trade has become impossible in the context of all the formalities one has to fulfil in respect of different taxations local, State and Central. There is no end to harassment caused to trade and productive efforts by each tax authority pulling its own way and imposing its own conditions and rules. Administrative and fiscal co-ordination between the State Government and local authorities and the simplification of procedure for assessment and collection of taxes and the use of statutory rules and orders only as a means for tax collection with an eye on equity rather than as an end itself are some of the remedies to undo this evil.

Question 196

No Comments.

Question 197

No Comments.

Question 198

Please see answer to Question 185.

Question 199

If it is necessary at any time to equip local bodies with additional resources beyond their powers of taxation resort must be had only to the assignment of a proportion of salestax and entertainment tax in the case of City Corporations and Municipalities and Land Revenue and Agricultural Incometax in the case of District Boards and Village Panchayats.

Question 200

There is much in the contention that lands under non-agricultural use and buildings are subject to multiple taxation of the same source of income and that, therefore, there is need for correlating the taxes levied by the Union under Section 9 of the Incometax Act, the urban immoveable property tax levied at the States' level and taxes levied by local bodies on property into a rationalised system. There should be a uniform basis of valuation for all the taxes concerned Central,

State and Local and the annual rental value of the property should be the basis of valuation.

Question 201

Please see answer to Question 200. We agree with the recommendations of the local Finance Enquiry Committee in so far as they desire no change from rents as the basis of valuation.

Question 202

Please see answers to Questions 187 to 190. We agree with the views of the Local Finance Enquiry Committee in respect of Government exercising powers of local bodies to collect property tax in the case of the failure of the latter to do so.

Question 203

Exemption need, however, be granted to property the annual rental of which falls below Rs. 120 a year and those owned and exclusively utilised by educational and charitable institutions duly approved by the State Government. Houses built under subsidised Schemes for the purpose of letting out at a specified rent such as Industrial Housing may also be exempted from property tax for the number of years such houses remain bound by indirect mortgage to Government in terms of loans advanced on them by Government. All State and Central Government properties used wholly for the purposes of office accommodation might be exempt from taxation but in no case such properties when they are used for residential or commercial purposes.

Question 204

Property taxes should not be progressive.

Question 205

City Corporations, Municipal Boards, Town Area Committees, Notified Area Committees, Cantonment Boards are the categories of local bodies that should be empowered to levy property tax. The maximum and minimum must be specified by the State Governments in the respective Act concerning those local bodies. Valuation and the determination of annual rental value must be in all cases quinquennial by valuers appointed for that purpose by the State Government in every case. In the case of failure of any local body to account for reasonable collection of tax State Government must have power to impose and collect taxes.

Question 206

Excepting the suggestions that the U. P. Government may set up a panel of qualified valuers to evaluate property subject to tax by local bodies quinquennially and that there is a greater need for vigilance and supervision on the part of State Government over the acts of commission and omission by the local bodies in this respect, the present administrative arrangements as noticeable in U. P. seem to be satisfactory.

Question 207

In respect of what are called 'service taxes' we entirely agree with the majority findings of the local Finance Enquiry Committee. All Central and State Government properties enjoying exemption from property tax should however be subject to 'service tax' determined by the evaluation of such services in such properties.

Question 208

With the knowledge of 'local rate' collections in Uttar Pradesh, we consider that the system of local fund cess both administratively and fiscally is satisfactory in operation. Abolition of Zemindary is not expected to prejudicially affect cesses here in view of the compulsory nature of its imposition and collection and being handled by the Land Revenue collecting machinery.

Question 209

Octroi and terminal taxes have been condemned by Committee after Committee and admitted by financial heads of Government since 1901 all over India as the most primitive form of taxation suitable for application to a water-tight self-sufficient economy of semi-rural type and as inconsistent with the economy as we understand it at present. Yet this taxation could not be scrapped from the Statute Books and Constitution of India by virtue of force of habit and a general disinclination to sacrifice a source of revenue, however imperfect. The introduction of terminal taxes to replace octroi, the former being a modified octroi without refund capable of centralised collection through Railway administrations, necessitated in U. P. the simultaneous initiation of an anomalous tax system known as 'toll at terminal tax rates' which is a contradiction in terms and which in reality is the disappearance of tolls and the re-emergence of octroi functioning side by side with terminal tax. There has been an increasing tendency on the part of Railway Administrations to do away with the responsibility for the collection of terminal taxes at source and accounting for them to the

Municipal Boards concerned even when the Municipal Boards concerned are prepared to part with a greater portion of such collections as charges for the same. The case in point is that of Kanpur, the terminal tax affair of which was taken up in 1951-52 with the Railway Board on behalf of both the business community and the Municipal Board by this Chamber, without the Chamber being able to induce the Railway administrations to involve themselves in the affair. With this feature of centralised collection of terminal tax absent, terminal tax at once becomes octroi with more regressive features attached to it. Under such circumstances, the maintenance of permanent staff with a number of outposts and the provision of skilled staff to interpret rules in this connection along with the machinery for appeals, if any, are bound to cost local bodies such amounts as will ultimately be found inconsistent with the taxes to be gathered. At the same time this tax system has been found exposing the Boards and their office machinery to temptations and the consequently legitimate charges of corruption and nepotism besides allowing great scope for dodgers and evaders to indulge in malpractices in almost an unrestricted manner. Taking this tax in varied forms as a necessary evil without alternatives at the moment when this question was considered, the Taxation Enquiry Committee 1924-25 sought to frame this measure within grave limitations as to rates, refunds, class of goods, character of goods, means of transport employed, exports and imports. State Governments agreeing with these limitations had been having considerable difficulty with the Municipal Boards in keeping them pinned to the principle of the least exploitation of this source of revenue. The policy of least resistance in the matter of Municipal finances and a general disinclination to devote the necessary time, labour and thought to local civic Government problems usually land the Municipal Boards in the consideration of suggestions to modify the terminal tax and toll schedules irrespective of the economic consequences of such moves. In one such attempt by the Kanpur Municipal Board in 1950, the Chamber had occasion to review the position. Excerpts from that review being relevant to the subject under consideration are reproduced here for the understanding of the problem in its corrective perspective. After pointing out that Kanpur's increase in population fourfold within about 10 years necessitated the provision by the Board of better and expanded civic amenities and that that provision would certainly take up the overall expenses of the Board it was shown by examples and worked out figures how it was possible to account for considerable economies in bigger undertakings than in smaller ones and therefore of a decrease in the *per capita* expense of the Board. If dishonesty, in aptitude and lethargy were removed, it was shown that the Kanpur Municipal Board could account for an increase of about 10 lakhs normally in their revenue from all the existing sources without any alteration in the rates of any tax. The review *inter alia* had to say the following in respect of terminal tax schedule that was then sought to be revised.

"If in the above background terminal tax and terminal toll are viewed, it will be seen that the revenue derived from this source which in the year 1946-47 was Rs. 11.28 lakhs and Rs. 2.28 lakhs respectively increased further in the year 1948-49 to Rs. 11.65 lakhs and Rs. 4.29 lakhs respectively lending enormous scope for further rightful exploitation. The collections during the first nine months for 1949-50 from the above sources were shown at Rs. 7.62 lakhs and Rs. 3.67 lakhs respectively. The Council of my Chamber firmly believe that with the present industrial and commercial expansion of Kanpur, the consumption of materials liable to terminal tax has also increased considerably and if the revenue has not registered a corresponding increase, it is due to the operation of various control measures and the frequent imposition of restrictions on the movement of commodities by rail necessitating the employment of motor transport. The staff employed over terminal barriers, under the above circumstances, would be found not to have discharged their duties as they ought to have in order to secure the rightful dues of their employers, i.e., the Municipal Boards. If both the public and private carriers laden with taxable commodities are checked without yielding to temptations or lethargy a great improvement in collection can be made possible. The Board should, therefore, first of all set their house in order rather than thinking in terms of a revised schedule for an enhanced import tax. With the return of normal trading condition and improvement in wagon situation, trading activities of Kanpur will automatically register a greater import and export giving place to a better revenue yield from terminal tax. Under these circumstances, the Council of my Chamber record their emphatic disapproval of the introduction of the cess schedule with the rates of imports tax mentioned therein.

The provision for the collection of the proposed cess departmentally is all the more objectionable because it defeats the very first canon of taxation that the collection of tax should involve least expenditure and should not be cumbersome. Before commenting in detail on the contents of the proposed cess schedule circulated to us with your letter, I may be allowed to draw your attention to the fact that buyers' market has come on its own everywhere and that it is becoming almost impossible to establish and maintain any industry or trade owing to the peculiar and complex depression we are all facing. While prices do not lend themselves to any further fall, costs which are no longer under the control of the entrepreneurs and the management tend to be rigid and looking up. Profits are next to nothing in enterprise and money conditions have become tighter to make money unavailable except under exceptional circumstances. Any tax scheme that might become a success in a sellers' market temporarily is bound to act adversely on trade and industry in normal times drying all other sources of taxation too. The Municipal Board should not forget that Kanpur is in a far greater measure a distributing and producing centre rather than a consuming centre. Its productive and distributional activities are characterised by acute forces of competition in normal times to which we have drifted. It is the traditional skill combined with possibilities for lower costs that has given Kanpur that place in Uttar Pradesh in particular and in Northern India in general. The Municipal Board by foisting a cess schedule for gathering a greater quantum of tax will have subjected almost every article of industrial use and distributional trade to terminal or toll tax and will have thus added to the troubles of costing and price-structure a greater element of rigidity consequently obliterating the industrial and distributional trade of Kanpur. The artificially increased revenue for a year or two will have created many a hole in the fabric of Kanpur, the Municipal Board of which after a couple of years will have been left with all dried up sources of revenue. The Board will, therefore, do well to think of the enormous harm that they will be doing to Kanpur and the insolvency they will be inviting upon themselves by their short-sighted policy of introducing an unworkable import cess schedule. Even a cursory examination of your proposed cess schedule containing different rates of levy on different items of imports into Kanpur classified rate-wise goes to show that the cess schedule in question has certainly not been based on either any statistical information or specific data relating to the possibilities for revenue collection, quantum of revenue as may be needed and can be gathered, economic implication of each item of the schedule and procedural and definable details. The entire scheme betrays a clear lack of realism and serious consideration. Taking item No. 28 in the cess schedule referring to coal, charcoal, coke and patent fuel as a case in point, I wonder if the Municipal Board had ever taken the slightest trouble of ascertaining the total imports of coal in Kanpur, the agencies that import and use them, the purpose of such imports etc. to be able to assess the possibility of revenue from import cess on coal alone and their attendant repercussions, leaving aside other considerations such as the incidence of this levy, its reaction on essential services such as generation of electricity by the public utility service here and of power by certain industrial concerns etc. etc. If the Kanpur Municipal Board is not aware of the fact that these major details must be considered before any such levy can be decided upon, God alone must help the administrative equipment and talents of such a Board. If, on the other hand, the Municipal Board trot out the plea that they have not enough material and skill at their disposal to equip themselves with this background material to enable them to assess each suggestion in their schedule in proper context, my Chamber and like organisations are prepared to nullify that plea by placing their services and resources at the disposal of the Board. Had the Municipal Board been in possession of even certain major details enumerated above and had they gone even superficially into our production trends and factors in industrial economy, they will have found it impossible for them to eschew an item like item No. 28 figuring in the cess schedule. About 25,000 mds. of coal for industrial use alone is imported into Kanpur everyday and a levy of 0.1-0 per md. on this coal alone leaving aside the rubbles coke etc. will yield from the proposed import cess a revenue of about Rs. 1,500 a day. That means that the annual yield only from this item of cess schedule would be to the tune of about Rs. 5,40,000 a year to the Municipal Board. My Chamber fail to comprehend the extent of revenue that the

Municipal Board desire to net in through measures that have the sure prospect of obliterating all forms of industrial and commercial activities from Kanpur altogether. If all items in the proposed cess schedule are taken into consideration individually in the manner detailed above, it will be found that the import cess schedule has been prepared to produce for Kanpur alone a revenue capable of sustaining four such Municipal Boards and administrations. It, therefore, obviously appears that neither much attention nor thought has been paid to the construction of a scientific cess schedule. Local Self Governing institutions such as Municipal Board should not come with such flimsy and half-baked proposals for taxation specially when every one of its measure is likely to affect not only the interests of Kanpur City but also of U. P. State as a whole in the context of Kanpur's importance as a producing and distributing centre."

With the multiplication in the means of transport as well the speed with which they operate, the changing conditions of productive technique and economy, trade has grown not only more technical and varied but has become complex. Terminal tax and octroi or any combination thereof are essentially taxes on trades and not so much taxes on consumption. They have almost become impossible to assess in an equitable and scientific manner in the context of the complexity of modern trade and productive technique. Transit traffic being very much affected by this tax despite provisions for exemption, this tax will appear to interfere unjustly with normal trade and distribution of commodities on a rational basis. There is no other tax that offers scope for fraud, evasion, underassessment, petty harassment, nepotism and extortion as terminal taxes and octroi taxes. It has been found that even with the best of statutory procedure and prescriptions, there are always loopholes left in the system of terminal taxes which is supposed to be an improvement on octroi and which the former seeks to replace. In letter No. R.72-1939/XI-243 dated the July 13th, 1940 addressed to the Commissioners of Divisions in U. P., Secretary to U. P. Government in the Municipal Department says that the cardinal point in the policy of the Government is the gradual extinction of octroi and that public interest and the need for consistency demand the consideration of an alternative method which may meet the end in view (end here is the repair to diversion caused to trade by the discriminatory effect of terminal taxes where they are imposed) without retrogression to octroi. Yet we find that U. P. Government allowing Municipal Boards all these years to levy 'toll at terminal tax rates' thus introducing by backdoor, according to their own admission, octroi without the exemption of even the transit trade. Indirect taxes are mostly unsuitable for local bodies as has been pointed out throughout in these answers in different parts and this particular tax very much so. Either exclusively or in combination, terminal taxes and octroi can be clearly shown as having detrimental effects on production and trade and as sapping other sources of revenue both State and Central. In the light of the above views of the Chamber on octroi and terminal taxes and in the context of the legal opinion obtained by Government of India that a Municipality which is levying a terminal tax can continue to do so at the existing rates even after it has been raised to the status of a Municipal Corporation, we cannot do so better than to agree with the Delhi Municipal Organisation Committee 1947 when they say "Terminal tax should be eliminated altogether from the tax schedule of the Corporation though the immediate objective may be reform rather than abolition. In the imposition of the tax, the Corporation might distinguish between articles of consumption which are imported ready for use and those which are imported as raw materials and in a semi-manufactured condition and are mainly re-exported after manufacture". The important point to remember is that local trade and industry should be encouraged and the tax should be so adjusted that such articles (a) which form the basic raw materials of industry and (b) which are imported with a view to mostly re-export are altogether exempted and that the articles of necessary consumption are governed by lowest rates possible.

Question 210

Yes. Octroi and terminal taxes or any combination by whatever name they may be called should altogether be abolished though this abolition might be gradual and accomplished in the next five years by stages. The most compelling reason for such abolition beyond others already discussed, is the altered condition in the structure of commodity taxation with the introduction of Salestax all over India. The Municipalities must be made to depend more and more on direct taxes within their jurisdiction and non-tax revenues rather than on indirect commodity taxes. Levy of surcharge on salestax on behalf of either all or some Municipal Boards is neither feasible nor desirable because salestax takes

the form of a turnover tax in this country and its implications are statewide rather than localised and the levy of surcharges will at once give place of discrimination. Yet keeping in view the proportion of the contribution to salestax by each Municipality to the total salestax revenue of the State, 25 per cent. of the collection of salestax may be earmarked for distribution to the Municipal Boards for a period of time on condition that such Boards will (a) gradually but within the period marked by the distribution of the proceeds of salestax extinct terminal tax and octroi taxes within their jurisdiction, (b) develop non-tax revenues by that time to the tune of their loss by the extinction of terminal tax or octroi, (c) actively render assistance to the Salestax machinery for better realisations of salestax within their jurisdictions. Legislation on a State basis must be undertaken to secure the ends in view.

Question 211

In view of answers to Questions 209 and 210 no comments are needed.

Question 212

The question itself seems to give the status of customs duties to terminal taxes and octroi when 'bonding' is thought of. As it has already been pointed out in answer to question No. 209, it is impossible to think scientifically of this tax and to correlate the same with other commodity tax measures. Hence it is futile to think of developing ideas on exemptions, procedures for collection, rates of levy etc., etc.

Question 213

As long as octroi and its variation terminal tax continues the basis of assessment should certainly be by weight, measurement or numbers and not *ad valorem*. Procedural delays and difficulties will be at their minimum in the basis of assessment recommended. Complete elimination of procedural delays and difficulties being impossible in the administration of this tax howsoever efficiently it is handled, it is better to tone up the moral fervour and sense of responsibility of the machinery entrusted with the administration of this tax and make the best of a bad bargain until it lasts.

Question 214

No. The loopholes and weaknesses inherent in the system of terminal taxes itself are such that they are capable of causing the very same difficulties and posing the very same problems even under conditions of nationalised road transport as they cause and pose today. Just as Railway administrations are reluctant to undertake this work for Municipalities in respect of terminal tax on goods carried by them, just as postal authorities have said that they cannot go any further beyond providing the list of postparcels received and that too on payment by the Municipal Boards adequate enough to do the job and that they cannot undertake to even to verify the contents of the parcel for assessment purposes, the Nationalised road transport agencies will not find it possible for them to undertake this work of goods terminal tax collections on behalf of the Municipal Boards.

Question 215

Octroi or terminal taxes cannot obviously be uniform for all Municipalities in all States and even in any particular State because of the varying conditions of consumption, population, area, needs, expenditure and the sources of revenue of the Municipal Boards in any State. Allied forms of taxes, Central and State, such as Excise, Customs, Salestax etc., both in respect of rates as well as the procedure of levy will be found uniform all over India in respect of central levies and throughout the State in respect of State levies. Correlation in these circumstances does not appear possible.

Question 216

Please see answers to Questions Nos. 168 and 169 in Part V, under motor Vehicles Taxation. There should be no tax on any goods carried by roads. The Chamber recommends its deletion altogether from the State List in the Seventh Schedule of the Constitution.

Question 217

While the power to sanction the levy and to fix the rate of levy must be retained by the Centre as at present under item 89 of the Union List in the Seventh Schedule of the Constitution, all pilgrimage Centres and big cities capable of accounting for a floating population at least equivalent to 5 per cent. of its total population should be permitted to levy a terminal tax on passengers carried by railway, sea or air, if application is made on this behalf by the City Board concerned by virtue of the resolution of that body through the State Government concerned. The rates should not be below 0-0-6 and above 0-1-6 per such passenger, powers to determine the exact rate within these limits being left by the Centre to the State Government concerned. These rates must form a part of all air, railway and sea passengers tickets costing 0-0-0 and over. Wherever tolls are allow-

ed to be levied such as hill stations etc. this tax should not be allowed to be levied. This tax will not be discriminatory in that the element of tax paid by a traveller by road through motor vehicles and bullock carts in the context of recommendations made will still be greater than this contribution by any passenger by railway, air or sea.

Question 218

With the development of new ideas on taxes on property and cesses on land revenue and increasing reliance being placed on non-tax revenues, 'poll tax', which is an ancient conception of the contribution of an able-bodied man to the communal welfare of the society he lives in has no place in the scientific taxation system anywhere in the world though in theory, it is still upheld in even advanced western countries. The elaborate system of exemption it calls for and the unequal incidence that will fall on the payers thereof makes it impossible to give it a place in the tax system.

Question 219

Taxes on vehicles (other than mechanically propelled), animals and boats are purely local taxes and State Government should have nothing to do with them beyond the sanctioning of the levy of such taxes. Tolls are suitable forms of taxation for small Municipalities and Town Area Committees under exceptional circumstances just like hill stations and health resorts.

Question 220

Taking into consideration the fact that the profession tax is a direct tax and the payees thereof for the most part will be those that pay taxes on income including agricultural income and the burden on them is tolerably heavy with a high incidence, the limit on this taxation placed by the Constitution at Rs. 250 per year should under no circumstance be raised. Profession tax must be confined only to local bodies. Municipal Boards may be allowed to raise taxes on trades and callings and the District Boards on circumstances and property as in U. P.

Question 221

Municipal Boards may be allowed to levy a 'theatre tax' on each performance such as each show of cinema, circus, drama and sports and wrestling bouts etc. etc. arranged on a commercial scale in addition to the State Entertainment Tax.

Question 222

Substantial portion of the gains of private individuals consequent upon the development of land and the provision of civic amenities should be canalised to defray the cost of improvements on hand so as to further add to the value of those very properties. Unearned increments of value and wealth as represented by land and immovable property holdings in any urban area in private hands must be treated as having at least partially come out of the expenditure of public funds in those areas. The entire matter being a continuous process and the development of cities can be extended to indefinite lengths, the local bodies concerned should have powers to impose (a) a special betterment tax with reference to property which stands to benefit from a specific piece of improvement and (b) a general betterment tax. This tax must be collected along with the

general house property tax. The assessment of betterment value must rest with a Board of Valuers constituted by the State Government, who shall also have powers to limit the rate of tax.

Question 223

No comments.

Questions 224 & 225

Please see answers to Questions 185 and 186. Just as most of our tax systems has developed in a haphazard manner so also the utilisation of almost every tax resource has been more or less fortuitous. Once a particular tax system has come into vogue however temporarily and specifically that particular system continues to operate even after the lapse of that specific circumstance. No State or local body appears to have any dependable statistical data in respect of persons and commodities, trades and callings, residence and migration etc. etc. so as to enable the assessment of scope for any measure of taxation. How can tax resources be explored and utilised in the absence of preliminary data? Fuller utilisation of tax resources in the case of local bodies will be possible again by arousing civic consciousness and honesty in the tax collector. These two elements are again conspicuous by their absence. Political demagogues who are able to sway the masses for party ends also appear to be impervious to the needs of the situation here. As long as a partymen's Counsels will be preferred to the results of the patient study of an economist in these matters much improvement in the situation cannot be brought about. The Administrator, specially the tax administrator must be selected for his detached outlook, judicial frame of mind, human understanding and patience.

Questions 226 & 227

No comments.

Question 228

The contribution of manual labour either as an additional tax or in payment or part payment of an existing tax will be found governed somewhat by the same principle out of which the ancient poll tax had developed and can never smoothly work. With huge unemployment and under-employment in the country and any tax system being dependant upon the ability of those that are called to bear the burden of the same to pay, the difficulties by way of comparative costs, assessment of contribution, the manner of availing manual labour and the evaluation thereof will arise and cloud the entire proposition beyond its recognition. This apart the numerous exemptions that will have to be made in subjecting the assess to pay tax in this manner and the difficulties in accounting for the realisation of any tax in this manner will make the realisation of this tax almost impossible. If taxes cannot be assessed and collected in kind even in cases of emergency, how can taxes be assessed and collected in terms of manual labour? 'Shram Dan' aroused by religious fervour or sentimental considerations such as helping public charity and public welfare has the character of volition of the person concerned. Tax is a compulsory contribution and there is nothing voluntary about it. It is, therefore, impossible to give manual labour the place of money or medium of exchange and tax realisations cannot be based on manual labour.

SUPPLEMENTARY MEMORANDUM SUBMITTED TO THE TAXATION ENQUIRY COMMISSION BY THE U. P. *Ad Hoc* COMMITTEE ON TAXATION THROUGH THE MERCHANTS' CHAMBERS OF U. P.

Taxation Enquiry and issues arising out of Government expenditure.

The taxation policy and structure, among other things, should have for their objective a progressive betterment of the standard of living of the people of the country as a whole. In view of the facts that Government expenditure is the apex of taxation policy and structure and that Government expenditure has considerable bearing on the exploitation of economic potentials in the country, an enquiry into the policy and structure of taxation can be effective and fruitful only when the various issues involved in Government expenditure is also fully examined from the utilitarian standpoint and the results of such examination are coordinated with the enquiry into the policy and structure of taxation. Such an elaborate enquiry and examination naturally involves the consideration also of Government's indebtedness and causes and effects of the provision for Debt Services by way of interest charges and other appropriations in the different Budgets of the Central and State Governments. In respect of India, which is an under-developed country and which is on the threshold of planned economic development, the need for such a comprehensive enquiry cannot be overemphasised.

Mere National Income cannot be any criteria for taxation

2. In our anxiety to secure a larger proportion of the National Income for public expenditure, development or otherwise, the impression is sought to be given that only

a very small share of the national income is collected towards taxes and that, therefore, the tax burden is not so heavy as it may be pointed out to be. It is forgotten that the economy of India has not yet fully developed and the *per capita* income in India is considerably lower than the same in other countries of the world. We think that different conclusions will emerge if available resources are evaluated in terms of their capacity for exploitation and yield they are likely to give and the focal point is maintained on the full exploitation of available resources and the betterment of the general standard of living.

3. The prime consideration at the present moment ought to be the creation of more income and wealth and all our efforts should be directed in bringing about a significant increase in the gross national product in order that a distinct improvement in the general standard of living can be achieved. It is only when constructive forces are allowed free play and the greatest emphasis is laid on utilising effectively and efficiently all the available resources, that the objectives of economic development can be realised. There can be no room for difference in approach between the taxing authority and the tax paying public, if adequate consideration is paid to activities that increases gross national output.

Management of our economic affairs in the Public Sector

4. If the management of our economic affairs at the Government level is considered in the light of figures

given hereunder the following broad conclusions will emerge :

(i) Non-tax revenues, which have a great scope for expansion, are relatively in the oblivion at the moment because of our complacent attitude to inefficiency and unsound management in the public sector.

(ii) We have been incurring public debts and sinking our resources so gathered in non-productive efforts also when we can ill afford to act that way at the moment.

(iii) All investments made from out of public debts in India in whatever level, central, state or local, should be made to yield returns, much more than to cover interest charges thereon under the heading 'Debt Services' and this does not appear to be apparently the case.

(a) Total tax revenue in India from all sources to Central, States and local in 1953-54 was to the tune of Rs. 780 crores composed of contributions in taxes to exchequers :

Central	Rs. 425.34 crores
Part 'A' States	Rs. 244.37 crores
Part 'B' States	Rs. 68.43 crores
Part 'C' States	Rs. 6.05 crores
Others	Rs. 36.00 crores

(b) Interest bearing obligations of Governments in India at the Centre and States :

Rs. 4,276 crores composed of :

Central	Rs. 3,876 crores
States	Rs. 400 crores

The obligations arising out of currency in circulation at about Rs. 1,100 crores has been added to the above figures.

(c) As against interest bearing obligations, i.e., debts of the Government of India at Rs. 3,876 crores interest yielding assets are only Rs. 1,979 crores including capital investment on railways.

(d) Our expenditure on Debt Services (Interest & avoidance of debts) in 1953-54 was Rs. 54 crores composed of :

Central	Rs. 37 crores
States	Rs. 16 crores
Others	Rs. 1 crore

5. In so far as we accept the system of mixed economy, Governments cannot be denied the right to own and operate public utilities in public interest. But the operation of all utilities should be on strictly business lines with the same obligations imposed upon the units in private sector as on units in the public sector in respect of accounts, taxpayments, commercial audit, fair returns etc. All forms of waste must stand avoided. Social services as might form the normal part of Government's activities must be only within the tax revenue means of Governments and capital obligations should not be incurred thereon for the present. If expenditure on ventures produce results counter to the overall productivity either in agriculture or in industries on a long range basis, such expenditure should be considered waste. Example of Sindri Fertilisers and the inability of soil to take in the products coming out of the Sindri Factory due to water scarcity or other causes can be cited as a case in point. It has been pointed out that when soil surveys are not yet complete, the use of chemical fertilisers cannot be planned. Another example is provided by the Nationalisation of Road Transport which occasions huge drain of public funds simultaneously with the growth of unemployment. All non-productive efforts, it may be pointed out, should be stopped either on the capital or on the revenue forum of Governments for sometime to come.

Main budgetary trends in India and the changing phase of the structure of tax revenue

6. A close study of the Budgetted, revised and actual estimates in the public sector since 1948-49 to this day reveals that there is ample justification for the feeling that Government have been, almost as a matter of routine, underestimating revenue and overestimating expenditure, thus resorting to the 'uneconomic level of taxation' of almost the same infinitesimal section of the population. There has been clearly an appreciable raid on the capital structure of private sector through the adoption of *ad hoc* and faulty measures of taxation with the sole aim of financing the public sector to the maximum extent possible through a policy of least resistance.

Industries in private sector and their expansion to account for satisfactory revenues

7. It will be clear that the Indian tax system to benefit and stabilise must have at its background industry and commerce of the country, especially if excises have to

be depended upon more and more in future and turnover tax has to play its legitimate part. Everyone of the forty-two industries covered by the 1951-56 programme of industrial development as per chapter XXIX of the Report of the Planning Commission, according to the admission of the Commission themselves, is beset with one problem or the other or a combination of problems. All these problems will be found related to the availability of necessary capital, the structure of costing and the competitive capacity of the industry concerned. The paucity of capital resources and the unsatisfactory flow of capital, even to cover the rehabilitation of existing industries, affect almost all sectors of industrial activity and set a basic problem. The success of loan issues on the part of Government last year to the tune of about Rs. 109 crores in the context of the failure on the part of private enterprise to raise even ordinary working capital shows that unless that class of investors, which is mostly from the lower and middle classes and which, in the hope of receiving on stocks a rate of dividend appreciably higher than on Government loans, is prepared to participate in risk capital, is encouraged, there can be little room for optimism. This encouragement, in its turn will be found to require that such enterprises are allowed not only to earn rewards for the risks they run and that taxation in as far as they are concerned is such that the enterprises they own are also given adequate opportunities to build for themselves adequate funds and reserves to be able to wither any storm and to face any emergency. It is clear that the taxation policy at present pursued, specially in so far as it concerns direct taxation, such as taxation on income, is the antithesis of what is needed at the moment.

Influence of Government expenditure on industry and commerce and the revenue yielding capacity of the latter

8. If we accept that the solution of the troubles that arise in the course of the execution of development plans, particularly in industrial and commercial sectors, is the joint and several responsibility of Government, business and labour then it is a little hard to look to business alone to account for cuts in production costs in the face of what appears to be the extension of priorities to the allocation of capital expenditure in the public sector, secured principally, by measures of taxation and in certain circumstances, by other means such as non-tax revenues, fees, loans, deficit financing, etc. It must be remarked that these sources have their due influence on business, those engaged therein accounting for almost the entire resource of Government in this country at the moment. Cost of production in industry can conclusively be shown to depend appreciably upon Government expenditure. When therefore the business and industry is faced with financial difficulties and costing problems, no Government expenditure should be considered sacrosanct save that required by self-preservation from hostile attack and the maintenance of law and order within the country. It should be realised that if money or credit was not there, expenditure would stop automatically. Government expenditure and consequent sources of revenue specially revenue from taxation, which has arisen by almost five times the pre-war standard with the sources of taxation-revenue including the classes of people affected by taxation remaining almost unchanged, therefore, merit consideration in the above context. The application of the brake to the fast moving Government expenditure and the consequent tax reliefs will help reduce the existing high costs, stimulate productive activity, and check the growth of unemployment. In the long run the expansion of economic activity that will follow will raise the Government's tax revenue besides creating greater and varied potentials for revenue thereby more than making good the initial sacrifice on the part of Government. For a country as large as India with a population that it holds, the present revenue budget of the Central Government at about Rs. 400 crores should be considered very insignificant. This needs to be increased many times over. Such a development can be possible only when the real wealth of the country is increased and more and more of purchasing power is placed in the hands of the country's population in terms of the progressive increase in real wealth. Creation of circumstances leading to all these events will appear to depend upon industrialisation, resetting agriculture and agrarian economy and the provision of incentives to people to work hard to save and to invest.

Emphasis on efficiency and economy in State undertakings

9. Some of the schemes of development that have been executed under the Five Year Plan and others outside the Plan executed by some States do not appear to give productivity and efficiency the place they deserve on the purely utilitarian scale. Even the blue-prints of these schemes are reported to be fortuitous and un-

planned. It is said that with a lesser number of gates, we could have accounted for the same performance and the whole thing could have served the purpose equally well in the Durgapur Project. That would have meant a saving of about 50 per cent. on the outlay accounted for heretofore in that project. The case of Chittaranjan was explained in the course of oral evidence by Sir Padampat Singhania. The number of such cases can be multiplied and stressed as taking place under our eyes despite public criticisms thereof all over India. It is here that a considerable lot of economy could be achieved. If monies were spent on these projects carefully and with an eye on the aspect of returns that every pie has to account for, there would always be justification to go to the public for support. There is another aspect of the matter which has to be borne in mind. It has been observed that once efficiency in the construction and conduct of undertakings is allowed to fall, it takes superhuman efforts to bring up efficiency and instil optimum economy in the working of these undertakings and the time taken in that process, at times, outstrips even the utility of the undertaking concerned. If the working of railways in India is viewed in this perspective in the last fifteen years, the truth of this Statement will stand out prominently. It is therefore recommended that all State undertakings barring a very few exceptions, must be run on the basis of private business undertakings with the freedom of action to the boards of these concerns and the charge to such boards to account for fair returns consistent with the possibility for these concerns to face buyers' markets, changes in demand schedules and the needs of the masses at large.

Compartmentalisation of the use of revenue

10. Subject to the foregoing conditions with regard to the construction and conduct of development schemes in the public sector, emphasis is also laid on the fact that development schemes must be, as far as possible, compartmentalised and revenue derived from relative compartments in the form of both taxes and non-tax revenues or earnings and fees must be applied to the schemes of development within these compartments. If this is done, it is believed that tax burdens would be more equitable and development benefits shared by all those that have paid for them.

New sources of taxation and revenue

11. In the course of oral evidence before the Commission, it was revealed that the Governments—Central and Local—would lose something like Rs. 80 crores in tax revenues, if the recommendations of the U. P. *Ad Hoc* Committee on Taxation and the important Chambers of Commerce in the matter of reliefs in taxation and the reform of the taxation structure were accepted. On a careful consideration of the entire matter, tentative calculations reveal that if the structure of taxation is straightened and the suggested reforms are accepted, the shortfall in taxation revenue from the present level may not exceed Rs. 40 crores under any circumstance. In the light of the Commission's direct query to the U. P. *Ad Hoc* Committee on Taxation as to what concrete proposals for tax revenue could the Committee suggest to make good any such shortfall, the entire matter was gone into carefully in the context of present economy, the difference heads and the tempo of expenditure, competitive claims of development programme and the limitations to which we are subject. It has been found possible to suggest certain tentative items of tax revenue as a result of such a consideration. When suggesting these items, the readiness on the part of the Commission to suggest, if necessary, suitable amendments to the Constitution of India has also been kept in view. The suggestions made herein should be taken only as a possible line of approach, the details pertaining thereto being left to be worked out.

(i) Excise duty on cement could be as high as Rs. 22 per ton and that on steel of all kinds Rs. 20 per ton. Based on present production figures, these two excises should be capable of accounting for about Rs. 6 crores in addition to what they are stipulated to produce at the moment. There has been considerable advance in building industry and in the tempo of new constructions all over. The imposition of this duty will lead to considerable improvements in architectural and constructional standards with an eye on utility combined with economy. It cannot be denied that this will be a welcome achievement. This duty, high though it may seem, will not cast undue burden on anybody on the other hand improved efficiency and economy in use of materials will reduce the overall costs of construction to an extent that, even after bearing in full the incidence of these duties, the beneficiaries and the users of such buildings and constructions will be found to be more advantageously placed than at present.

(ii) The tempo of building activities and the advance made in and the scope for building industry suggest openings for other constructional activities such as roads, public constructions etc. which should also consume these two essential materials of construction with

an eye on economy with utility. In addition to these constructions contributing in their own way to the excises stipulated above, their advances suggest new possibilities also. One such possibility is a levy on bullock carts as a central intake. The Motor Vehicles Taxation Enquiry Committee place the bullock carts using roads in India at about 60 lakhs. The Indian Road Transport Development Association figures this out as near about a crore. Even assuming the figure of 60 lakhs as the correct conservative estimate, a tax for road development, at Rs. 5 per bullock cart, a central levy, if necessary, after a slight change in the Constitution of India, can be thought of with the stipulation that this levy shall not interfere with land revenue adjustments for existing collections on behalf of local bodies. Petrol and Motor spirit can be made to bear still heavier burdens in the context of these developments in addition to this levy on bullock carts. Revenue from taxation in these levies may yield Rs. 6.5 crores to Rs. 7 crores in addition to revenues now derived.

(iii) The biggest State industry is railways. By more efficiently operating it and by securing maximum economy possible in all directions this state industry can be made to yield better results. Since the present levels of Railway fares and freights are more or less commercial optimums increase in fares and freights as such cannot be recommended in a serious vein. Nevertheless a levy of development charges in the nature of excise or surcharge on *ad valorem* basis on tickets and railway receipts may be collected and such collections to the last pie be canalised into railway development schemes without treating them as railway revenue in the course of business and operation of railways. This could be as much as 7 per cent. to 10 per cent. of the freights or fares paid or to be paid. Revenue from this source should account for about Rs. 35 crores a year.

(iv) There are about 7.5 crores to 8 crores houses in India at the moment. New housing schemes are well under way. While urban areas may account for a crore to 1.5 crore houses, rural areas may account for the rest. With a light modification in the Constitution, a central capital levy at a flat rate on each tenement can be levied purely for development purposes. A levy of Rs. 5 per year per tenement excluding hamlets in rural areas may be considered as a feasible proposition.

(v) A tax ranging from Rs. 5 to Rs. 8 per employed person deducted and collected at source once a year as a central levy may be considered. All revenues derived from this source must be applied to alleviate unemployment.

(vi) To the extent recommendations under (ii), (iii), (iv) & (v) lighten Centre's commitments on planning for development on the lines indicated, the pressure on Central and State finance will be lighter. This apart the taxation structure will have so evolved as may offer resilience in exploitation as development progresses, industries expand and more wealth is created.

Modifications recommended in the Indian tax system

12. Having regard to the above views, the Indian tax system would seem to require modification somewhat on the following lines:

A. The tax system should be broadbased on different indirect taxes so that tax yields therefrom could be enlarged according to needs from time to time and without impeding the progress of economic development in relation to available resources.

B. The reliance that has, heretofore, been placed on direct taxes such as taxes on income as the principal source of Government revenue must be given up and useless spending and consumption including those on luxury and prestige levels must be discouraged by preventive taxation, direct and indirect.

C. In order that the evil effects of direct taxation at a high level may be kept under control and check the following measures may be adopted.

(i) Rates structure of taxation on income should be so adjusted and progressive as may be capable of encouraging personal initiative and acting as incentive for the expansion of productive activities.

(ii) The system of taxation on income and the mechanism administering the system should be so modelled as may leave appreciable residue of income to be available for disposal and with the proviso that if that residue is canalised into savings and investments the same might enjoy adequate tax reliefs and concessions and if the same is canalised into personal spending and prestige building activities, that residue or the part thereof so spent might be subjected to taxation on almost penal levels for sometime to come.

(iii) Corporate profits should be encouraged specially when such profits are not distributed by special reduction in the tax on Corporate incomes so retained and used for further productive ends.

SECTION 2

REPLIES OF ORGANISATIONS OTHER THAN CHAMBERS OF COMMERCE

NOTE.—The full list of organisations which sent replies to the Questionnaire of the Taxation Enquiry Commission is given in Appendix B of Part I of this volume.

ANDHRA

BHARAT KISAN SAMMELAN, NIDUPROLU (CAMP)

REPLIES TO THE QUESTIONNAIRE OF THE TAXATION ENQUIRY COMMISSION.

General

1. We agree with (a) and (b) as being the best objectives of a sound tax policy (that is reduction in inequalities of income and wealth, encouragement of incentives to work to save to invest).

2. The most important criterion is whether the burden of tax system as a whole, as levied by all public authorities Panchayats, Municipal Councils State and Union Governments, bears equally on different sections and classes of our people. At present, the agricultural masses, especially the small-holders are made to bear disproportionately higher tax-burdens.

3. On the whole, it is true to say that our present tax system does not conform to the principle of ability to pay. The burden of land revenue is based upon the right of the state to appropriate 50 per cent. of the net income irrespective of the income of our agriculturists while the income-tax burden does not reach that limit until very high income-levels are reached. The tax-burden's borne by our landholding peasants are highly regressive.

4. So far, the upper middle classes and richer people have had to pay much less than what they can be expected to bear and certainly less than their proportionate share, when the marginal utility of incomes is kept in mind.

5. The answer to this is dependent so largely upon the manner in which the present disequilibrium in tax-burdens on different classes is sought to be eliminated.

6. At present, there is a strong case for reducing the burden of indirect taxes; especially of those taxes like Sales taxes, profession taxes which fall on the lower income groups. This is a matter which deserves careful and scientific study and which so largely depends upon the financial exigencies and political possibilities.

7. It is possible that the State may undertake both directly and indirectly a number of industrial and commercial, even agricultural enterprises and the income therefrom may go on swelling. Yet, it is equally possible that for the first ten years, these enterprises may not be able to yield net profits. It is also probable that political considerations may prevent the emergence of any profits and the state products may come to be sold on a no-profit and no-loss basis.

8 and 9. We do not agree with the view that the proceeds of special or particular taxes should not be earmarked. On the other hand we feel strongly that the present land revenue and other taxes that are imposed on our agriculturists should be progressively replaced by cesses imposed to finance specific public activities specially intended to benefit our agriculturists or certain sections of them. We have in mind the cotton cess, oil-seeds and oils cess.

10 and 11. This depends so largely on the political decisions of Governments, generally speaking it would be best that Government enterprises are so managed as to yield good enough profits, to be utilised for general revenues or even for specific developmental purposes. Therefore the price-fixation policy must be such as to yield good enough profits, consistently with the ability of the consumer to pay.

12. The answer to this question depends upon the social policy of the Governments; that is, whether it is intended to induce educated people to go to villages or to towns, to force rural people to migrate to towns, etc. Ordinarily urban people are able to earn more, that too comparatively easily and under easier conditions of life and better conditions of work and so, they ought to be made to pay more, but actually it is the rural people who are made to pay more. Income must be treated as the best criterion for differentiation, instead occupation like agriculture is wrongly taken up by Governments as the criterion. For the mere sin of owning some land as a means of employment, cultivating land as a source of income, a peasant is made to pay, as a kind of tax on employment itself.

13. We have already said that our agriculturists are being discriminated against and even among them, the small holders owning 10 acres of wet land or 20 acres of dry land who form 90 per cent. of our land holders are made to bear too heavy a burden.

14. Contrary to the wrong assumptions made by so many economists and political leaders, the economic weakness of the small holders and middling peasants has only been reduced slightly but their comparative economic

position *vis-a-vis* the urban classes has not improved since 1939. On the other hand, the richer peasants, the urban upper middle classes and richer classes have certainly benefited by war-time boom. On the whole the agricultural classes are not better off, comparatively.

15. It is true that the additional book-keeping and other office-equipment necessitated by the sales-tax added to the financial and psychological burdens.

16. The urban classes receive the major portion of the benefits of public expenditure; yet, they pay less in taxes. Yet it is so difficult to make people pay higher taxes on account of public services, except by way of special cesses.

17. We are unable to provide statistical or otherwise detailed evidence but we do feel that agriculture, as an industry, is weighed down specially heavily by the present system of taxation. We urge a scientific and non-political enquiry into this question.

18. We are not so certain that adequate funds can be raised through taxation for any large-scale economic developmental programmes. Yet, much can be done by the utilisation often through voluntary means or some times through compulsion of much of the unused or under-employed or unemployed labour, during convenient seasons, for achieving many of our developmental programmes (especially of small-scale) and also for the benefit of rural areas.

19. The order of precedence suggested in the question will be alright upto the (a) and (b) and (c). But (d) i.e., fresh taxes should be placed next to (e) development of non-tax revenues; such as the utilisation of waste lands, Fisheries, Forest produce.

20. So long as we have to depend upon private sector also in industries for our national development, our taxation policy should be so moulded as to promote the incentives to invest, and plough savings in further development and to work, especially in the managerial sectors.

21. Any concessions given in tax-levies to capital ploughed back into industry, as distinguished from tax levies on capital or profits earned but spent on current expenditure; similarly concessions on expenditure on capital-goods will go a long way to help towards capital and industrial development.

22, 23 and 24. Special and scientific studies must be made to examine these points.

25. It is easy to say 'yes' to this question. But our experience of the working of the controls over imports, exports and internal distribution cautions us against regulating consumption of too many goods or at too many points of social life. Our long-time experience of taxes on tobacco, drink has shown that though tax might bring in increasing revenues, they could not effectively check consumption.

26. It is hazardous to think that tax policy is capable of promoting in a measured manner the efficiency of the productive system. The import and export policies and Revenue Duties do render some effective help but it is not easy to measure such help or its distribution between the various sectors of the same industry. This is why economists favour direct subsidies and controlled assistance to produce more or less ascertainable development in desired directions. Anyhow these policies are generally determined by Legislatures, not so much on the advice of experts as because of political exigencies.

27. Tax system cannot be the principal engine to secure any order of priorities in development. The activities of the Industry and Commerce Ministries especially in the spheres of Import and Export policies supplies of raw materials, capital and transport facilities and price policies can be of much greater importance.

28 and 29. It is not easy to offer any comments on these points; though they sound so familiar. These are also some of the many dark corners in the realm of our knowledge regarding the effects of taxation; and they all deserve pilot studies before any views can be ventured even by economists.

30. No. On the other hand, the present tax policy worsens the existing inequalities of incomes and wealth.

31. Lowering of tax-burdens (direct and indirect) on our agricultural classes, is one of the modifications needed.

32. Public Expenditure for the benefit of rural mass poorer classes can minimise inequalities of incomes more.

effectively and directly than the manipulation of the tax-system; other than the Land Revenue. But the lowering of the burden of land revenue or its complete abolition can help our farmers most directly and thus help towards the minimising of the present inequalities between agricultural and non-agricultural classes.

33. Our constitution does not permit any discrimination against Foreign Capital. And it is not good policy also to moot such a proposition.

34. The various tax-possibilities indicated in Article 269 of the constitution have to be explored, not all together, but only in answer to the growing needs of the States and in relation to the rising capacity of the people to pay them. For instance, (c) and (d) if taxes on railway fares and freights are to be levied, and also on goods and passengers carried by railway, sea or air, the proceeds must be ear-marked for the development of railway and co-ordinated road communications.

35. We are definitely and generally opposed to the reimposition of sales tax, surcharges on land revenue, betterment levies, agricultural income-tax.

At the same time, non-agriculturists seem to be considering the details of any proposals intended to levy a surcharge on the land revenue to be paid by bigger land holders having more than 50 acres of wet land or 100 acres of dry land, provided others owing less are to be definitely exempted and there is an assurance that Income-Tax on agricultural incomes will not be levied, in addition to such a surcharge.

Betterment levies on holdings above a prescribed minimum area to cover only a portion, not exceeding 50 per cent. of the cost of any project in the developed areas and 25 per cent. in the hitherto undeveloped areas and to be recovered in ten or twenty small, equal, annual instalments to be collected only after the first five years subsequent to the inauguration of any irrigation or drainage scheme are also being considered by economists, planners and urban intellectuals.

But great caution must be bestowed by political leaders and economists and consideration shown to the actual needs and ability of the local peasants before any serious and detailed consideration is given to these proposals, i.e., surcharge on land revenue and betterment levies.

Our agriculturists have suffered so much and for so long by the State's neglect of their most essential need for irrigation and Flood control facilities, while so much of public revenues were being spent for the development of urban areas, their industries, trades, educational and other cultural equipments that it does not at all seem to be just to them that they must now be made to pay either in full or in part, so directly for the development of irrigation and Flood Control Projects and facilities and no wonder, they have put up such a stiff opposition to the Madras Government Proposals in this direction.

Moreover the present system of land revenue is so regressively heavy and presses so hard on the very source of employment and living of our peasants that they cannot think of permitting a surcharge to be levied there upon. For too long a time, agricultural income-tax has been proposed by most economists and legislators also. But there were then the big Talukdari landlords. With the abolition of the Zamindari system and the growing distribution of land among millions of peasants in all the areas where formerly there were the big Zamindars and Talukdars, the proposal to impose agricultural income-tax is not likely to appear so progressive or attractive.

If the present land revenue system (not excluding the rate) is to be replaced completely by agricultural income-tax, leaving atleast as big an exemption limit as under the usual income-tax system, there may be much to be said for it, although, it is bound to create more trouble to the farmers and Government in its administration. If it is to be levied on top of or in addition to the present land revenue duties, there is absolutely no justification for it and our farmers are sure to resist it with all their might.

Moreover the experience of both Bihar and other State Governments which have imposed it, when there were the Zamindars was not so encouraging, even from the standpoint of collections.

36. Provided there is no proposal to levy any betterment tax, the desirability of levying a tax on unearned increments in value of land and other property as a result of public projects of development may be considered. That too, subject to the condition that the sales of lands of small-holders having less than 10 acres of wet land or 20 acres of dry land are exempted, since such small holders are often obliged to sell a portion of their lands in order to liquidate their debts or to improve the rest of their holdings. It is also necessary to consider the advisability of not levying such a tax on such unearned values during the first five years of the special development.

37. To increase revenues from existing taxes two means may be adopted either separately or simul-

taneously to make the taxes less onerous and conditions of assessment, etc., less complicated and exempting those from taxes who are more numerous but who contribute comparatively very small portion of the tax-revenues or to increase the efficiency and honesty of the collection-staff and minimise their powers, capacity and practice of harassing tax-payers. This is a matter for experts in tax-collection and the Finance Ministry.

38, 39. For the time being it is best not to frighten people with proposal for new ways of taxing our masses or classes, either through the State Governments or the Union Government.

Export Duties.

113 and 114. It is only in the case of such of our exports for which we have a practically unchallengeable monopoly, can there be a clear case for export duties. Jute is one such thing. Even in that case, we have to be extremely careful, as the substitutes are growing in their importance. On the whole it is best not to resort to this means. In fact we lost heavily by imposing export duties on groundnut, linseed, etc.

115. Yes. We must utilise the proceeds of our export duties entirely for the benefit and protection of the producers and merchants interested in the products paying export duties.

116. Indeed, State trading in our exports will be preferable to export duties, because, the prices of our exports will be capable of quicker readier adjustment in accord with conditions of competition in foreign markets than export duties. It is for experts to formulate detail proposals for the constitution, management of the State Trading Corporation with or without the partnership of private enterprise either as a monopoly concern or as a dominant cartel in the export trade.

Central Excises.

117. Betelnuts, unmanufactured tobacco, especially tobacco stems and rubbish ought not to have been included in our excisable commodities.

118. The differential rates of duty are better. But those varieties of unmanufactured tobacco which are used mostly by the poorest ought to be exempted from the excise duty. The present rates on lower qualities of tobacco are too high; especially on Beedi tobacco.

120. Cottage match industry is certainly benefited by lower excise duty.

121. There is great need for simplification in the present procedure and standing orders regarding licensing, warehousing, transport of our excisable commodities. Many a farmer has come to grief and ruin because of the complicated rules, unsympathetic enforcement of rules and corruption in the administration. Advisory Councils of the producers, warehouse-owners and administration at District and Zonal levels are necessary to iron out difficulties and help the producers, traders, etc., to represent their genuine grievances with a greater chance of sympathetic hearing.

122. Indeed, a good portion of the proceeds of the Excise duties, not less than 6½ per cent. ranging up to 25 per cent. should be set apart for the benefit of the concerned State Governments and the producers and others of the concerned industry or product and that ear-marked sum should be shared equally between the state and the industry. The colossal losses sustained in recent years by the producers of tobacco, jute, oil-seeds lend strength to this demand.

139. We are not at all in favour of the imposition of agricultural income-tax, on top of the present land revenue. If and when it is to be imposed, in place of land revenue, the exemption limit must be at least as high as what obtains in the case of income-tax.

141. The items mentioned in this question have to be taken into full consideration in estimating agricultural incomes. Additional items like (iii) (e) the periodical improvements needed to repair the ravages of erosion, salinity or loss of fertility (ii) (a) the effects of fall in prices of different agricultural products, any adverse turn in terms of trade against farmers, have to be given full consideration.

(b) This idea of averaging the income over a number of years cannot be helpful to agriculturists. It is necessary to be taking into full account the alterations that take place in the prices of agricultural to make peasants suffer from any bad calculations made either by officers or by themselves.

142. It is impossible to venture any suggestions regarding the rates of this tax before we are certain under what circumstances these tax is to be imposed. There cannot be any uniformity as between different states; especially in regard to this tax is Rs. 6,000. The same must be allowed to this tax too, whenever it comes to be imposed. The rates must be certainly lower than in the case of Income-tax.

143. We are in favour of the abolition of the present land revenue system, as it takes no notice of the inability of the small holders to bear it and as its proportionate

incidence has no relation to the principle of ability to bear. Secondly we are opposed to periodical settlements, whether it is once in 20 or 30 years. It is true that Government revenues may suffer heavily by the abolition of the present system. But that cannot be helped. A portion of this possible loss can be made up by raising water-rates by $12\frac{1}{2}$ per cent. or by increasing the area under irrigation, etc.

144, 145, 146 and 147. As we have been urging the need for abolishing the present system of land revenue, we do not propose to offer any detailed replies to these questions which deal with the various aspects of settlements and resettlements of land revenue. Nevertheless, so long as this land revenue assessment is continued, we are strongly of the view that once an assessment is made, there shall not be any resettlement as a whole except for making concessions to agriculturists in view of adverse changes in conditions of cultivation, prices, crop economy.

149. There is no need to discriminate in regard to co-operative holdings.

151. Since only a very small area (i) in rural areas is likely to be used for non-agricultural purposes, not much can be gained by imposing any higher duties. Moreover house-sites ought to be exempted from land-revenue, since house-building in rural areas needs to be encouraged.

152. The existing village revenue staff are over-worked and weighed down by too many duties.

154. For purposes of land cess to provide (i and ii) funds for Local Boards the present system of basing it on land revenue, though regressive can be tolerated, since the conception of annual value is likely to prove to be elusive.

155. (i) We are not in favour of a betterment levy based on the increase in the value of land, as such calculations are likely to be inaccurate. But we do not mind a surcharge on the stamp duty on the sales of lands, which are brought under irrigation or such other special improvement and whose values have gone up appreciately, say by more than 20 per cent.; that too, only after the first five years have elapsed after making the improvements (ii) an irrigation rate or fee has to be charged for the water actually supplied.

(iii) Small compulsory cess within the ayacut can be considered, whether water is utilised or not, only after the first ten years of the new development, so that during the first 10 years, it will not go against peasants while there after it will induce them to utilise water.

156. The very idea underlying the proposal of absorbing for the State, a portion of the increase in land values after the completion of a developmental project is highly retrograde. After all such a project is undertaken not to increase the value of such lands, but as sources of additional employment income and security. Therefore the State ought to think in terms of absorbing a portion of the speculative values of lands before they materialise, which can happen only at the time of actual sales.

If and when a portion of the realised but enhanced sale values of lands is collected by the state through a suitable surcharge on such realised sale values, such proceeds ought to be ear-marked for the protection, development of the concerned projects and the people of those areas.

157. The irrigation rate may include both an adequate charge for the water (i) supplied and an element of tax but on the whole, the rate ought not to be so prohibitive as to discourage the use of water, (ii) this rate should be based primarily on the area irrigated and the quantity of water needed by specific crops and not on crop value, (iii) no need to revise these rates periodically, (iv) experiments can be made by reducing water-rates on specific crops during the initial stages.

159. Different rates or cesses have to be collected, depending upon the nature of the works, perennial irrigation, tanks, rivulets, tube wells, etc., in relation to local circumstances.

160. It is best not to have any consolidated rate of land revenue.

162. We are not generally in favour of an imposition of a surcharge on irrigation rates based on crop values or sizes of holdings; but for the purposes of financing projects of a local character, it is best to leave such matters to be decided by the society of peasants concerned before the State steps in with its coercive powers.

ASSAM OIL COMPANY, LTD.

REPLIES TO THE QUESTIONNAIRE OF THE TAXATION ENQUIRY COMMISSION

THIS MEMORANDUM is submitted by the ASSAM OIL CO., LTD., a company engaged in searching for and producing oil and refining, distributing and selling petroleum products in India.

Question 63 :

Should any tax concessions be given to encourage development of mineral resources? If so, what form should they take? In particular, should depletion allowance on wasting assets be allowed? How should it be computed for different kinds of assets you have in view?

1. In our opinion tax allowances should be given to encourage development of mineral resources and in particular to those engaged in searching for and producing oil.

2. It is well known that searching for oil involves very heavy outlays not only in the equipment to be provided, but also in connection with the stores used therein, and the salaries and wages of the trained geologists and their assistants. It is also well known that out of many areas explored it is only in a very few that a concern is successful in finding oil in commercial quantities justifying production therefrom.

Inasmuch as the mineral deposits, from which the oil produced is obtained, are of a wasting nature it is most strongly urged that allowances should be granted in calculating the assessable profits of an oil producing concern so as to compensate the tax-payer for this exhaustion.

Finally the benefits arising to a Country from its indigenous oil production are too well known to require elaboration.

3. The foregoing can be summarised under the following three main headings which are amplified in the succeeding paragraphs—

(a) Allowances for Survey and Exploration including geological, geophysical and drilling expenditure during the period of Survey and Exploration.

(b) (i) Depreciation Allowances on all Capital assets employed in Survey and Exploration and

(ii) an option in the event of closing down to carry depreciation allowances on both surveying and drilling equipment and an allowance for obsolescence, backwards and the right to offset them against previous profits.

(c) Depletion Allowances.

4. Survey and Exploration Expenditure [See paragraph 3 (a)].

The Memorandum referred to in paragraph 6 outlines the treatment accorded to exploration expenditure elsewhere. In India, however, the authorities have some hesitation in admitting as an expense survey and exploration expenditure incurred by an oil producing company in any area before oil has been found there.

It is the view of this Company that since it is a concomitant part of the activities of an oil producing concern to maintain its business (namely its own production of oil) it follows that all costs of exploration and surveying as set out in paragraph 3 (a) as well as

drilling for oil supplies should be treated as normal revenue expenditure except to the extent that it represents Capital equipment.

5. Depreciation and Obsolescence Allowances [See paragraph 3 (b)].

Difficulty has been experienced in obtaining agreement that depreciation should be granted in connection with Capital Equipment utilised on surveys. The Company, therefore, considers that depreciation should be granted in future without question on all expenditure on Capital equipment which is incurred and used in searching for oil.

Furthermore, where an oil company ceases to produce oil through the exhaustion of its mineral deposits an obsolescence allowance should be granted on all surveying, drilling and production equipment then discarded. A situation might well arise where the depreciation and obsolescence allowances in the year of cessation are so extensive that they exceed profits in that last period and in consequence we consider that the loss should be carried backwards, up to a limit of, say, six years and set off against previous profits.

6. Depletion Allowances [See paragraph 3 (c)].

The taxation legislation of other countries grants Depletion Allowances to oil producing concerns since they are engaged in the working of deposits of a wasting nature. The basis of these allowances vary but they are outlined in a memorandum headed "Oil Companies—Taxation Treatment" a copy of which is enclosed.

In the U. S. A. where there are many more oil producing enterprises and with substantially greater oil production, Depletion Allowances are granted of 27½ per cent. of the gross income from the oilfield (with a maximum of 50 per cent. of the net income from the appropriate area) or an allowance is given calculated by reference to the actual cost of the property, whichever is the greater.

In Canada the Depletion Allowance for oil concerns is 33½ per cent. of the net income from production, together with an exemption from taxation of up to 20 per cent. of the dividends paid by the Oil or Mining Companies. In neither case is the total allowance limited to 100 per cent. of cost. In the U. K., allowance is calculated by reference to the cost of past exploration expenditure in the Petroleum Province from which production is obtained.

We would recommend that the depletion allowance should take the form of an allowance calculated on profits from successful production as is granted in the U. S. A. and Canada and that it should not be limited to 100 per cent. of cost.

In this way not only would the inherent commercial risks and the heavy cost which form part of the business of oil production be recognised, but allowances in this form would encourage exploration for further indigenous oil supplies which, where successful, would yield very considerable benefits to the economy of the country as a whole.

MEMORANDUM

OIL COMPANIES—TAXATION TREATMENT

THE ESSENTIAL POINTS GOVERNING TAXATION TREATMENT IN THE U.S.A., U.K., AND CANADA OF EXPLORATION COSTS ARE AS FOLLOWS :

I. DRILLING EXPENSES :

(1) In the U.S.A. Intangible, drilling, and development expenditure ANYWHERE is allowed as an EXPENSE in computing profits, and where this expenditure exceeds oil income of the year it can be set off against any other income of the taxpayer, e.g., Dividends on Investments. Where the expenditure exceeds total income it can be carried forward against future income within the next 5 years.

(2) In the U.K.

(a) The treatment outlined in (1) above applies to all such expenditure which is in the same geological oilfield or structure as that from which commercial production is being obtained.

(b) Drilling expenditure not falling under (a) but with the same Petroleum Province as that from which commercial production is being

obtained is amortised under the "Cost" Depletion allowance for that Petroleum Province.

This treatment also applies to all expenditure incurred in the Petroleum Province before commercial production is obtained.

(c) Drilling expenditure (after 5th April 1952) outside any such Petroleum Province is EXPENSED when exploration in that area is finally abandoned.

NOTE :—For this purpose the whole of Assam/Tripura would (if in U.K.) constitute one Petroleum Province, and would come under (b) but drilling in, say, Cutch would be outside this Petroleum Province and would come under (c).

(3) In Canada. The position here is similar to that in U.S.A., all Drilling costs incurred by a business engaged in production, refining or marketing products

being EXPENSED. Where this drilling expenditure plus geological and other exploration expenditure exceeds oil income it CAN NOT be set off against other current income, but it can be carried forward and deducted from future oil income without time limit.

II. GEOLOGICAL AND GEOPHYSICAL EXPLORATION:

(1) **In the U.S.A.** Geological and geophysical exploration expenditure is EXPENSED when the rights over the areas prospected are sold or abandoned. Where the area prospected is acquired or retained as a potentially productive property the exploration costs form part of the outlay amortised under "Cost" Depletion.

(2) **In the U.K.** This type of expenditure is divided into three categories:—

- (a) that incurred in the same geological oilfield or structure as that from which commercial production is being obtained;
- (b) (i) that not falling under (a) but within the same Petroleum Province from which commercial production is obtained;
- (ii) that incurred in the Petroleum Province before any commercial production is obtained;
- (c) that incurred in other areas outside any such Petroleum Province.

Category (a) is EXPENSED when incurred as in I. (2) (a) whilst (b) is amortised under the "Cost" Depletion allowance for the Petroleum Province. Expenditure under (c) after 5th April 1952 is EXPENSED when exploration in that area is finally abandoned.

(3) **In Canada.** All this type of expenditure is EXPENSED where incurred by a business engaged in production, refining or marketing petroleum products. (See I. (3) above.)

III. DEPLETION ALLOWANCES:

(1) **In the U.S.A.** There are two annual alternative forms of allowance for each mineral property (corresponding roughly to "geological field or structure").

EITHER

- (a) A "percentage" allowance based exclusively on proceeds of oil from the mineral property of 27½ per cent. of value of crude oil at well head with maximum of 50 per cent. net income from crude oil, i.e., value at well head less—

- (i) Drilling costs of that property;
- (ii) Share of general overheads;
- (iii) Depreciation on production equipment but NOT deducting any Drilling costs in other

areas or any geological outlays in abandoned areas.

OR

- (b) A "cost" allowance of that part of the past expenditure on the property not otherwise allowed for taxation, obtained by applying to the unallowed outlays the following fraction:—

$$\frac{\text{production units of the accounting year}}{\text{total estimated future production units from mineral property at commencement of the accounting year}}$$

NOTE:—Where the "percentage" allowance is claimed for any year then the allowance granted is deducted from the balance remaining to be amortised under "cost" allowances, but when these outlays have been fully amortised the "percentage" allowance can still be claimed.

(2) **In the U.K.** A "cost" depletion allowance is granted in respect of Drilling, Geological and Geophysical Expenditure in the same Petroleum Province from which commercial production is being obtained. The amount expensed each year is obtained by applying to the unallowed outlays the greater of the two following fractions:—

production of the accounting year

- (i) total estimated future production from the Petroleum Province at commencement of the accounting year,

or (ii) 1/20th.

(3) **In Canada.** A percentage depletion form of allowance is granted. This consists of 33½ per cent. of the net profits reasonably attributed to the production (as distinct from refining and marketing) of oil or gas.

IV. GENERAL NOTES:

In Canada there are two further special allowances

- (1) A percentage of the dividends paid by an operating Oil Company is exempt from Income Tax payable thereon by the recipient. The exemption varies from 10 per cent. where income from Mining production is between 25 per cent. and 50 per cent. of total income of Company to 20 per cent. where income from Mining production is more than 75 per cent.
- (2) A Special Tax Credit of 30 per cent. of expenditure (Excluding Geological or Geophysical outlays) incurred on drilling deep test wells specifically approved by Ministry of Mines where drilling is unsuccessful.

NOTE.—This allowance is additional to the Company treating the whole outlays as an EXPENSE.

SUPPLEMENTAL MEMORANDUM OF THE ASSAM OIL COMPANY LTD.

1. This Supplemental Memorandum has been prepared in response to a request by the Chairman at the meeting with the Commission which the representatives of the Company attended in Calcutta on Thursday, the 11th March, 1954. At the close of that meeting Dr. John Matthai asked the representatives to lodge with the Commission the Company's detailed proposals in regard to the treatment for taxation purposes of the various matters discussed at the meeting, suitable for the Oil Mining Industry in India.

2. It is the considered view of this Company that in computing the taxable profits of a business engaged in the production of oil or natural gas in India the taxpayer should be entitled to deduct additionally to expenses and depreciation at present admitted by the Central Board of Revenue.

A. In respect of prospecting expenditure

- (a) all intangible outlays (e.g., salaries, wages, consumable stores, etc.) incurred in searching, exploring and drilling for further possible supplies of oil or gas, and
- (b) an allowance for depreciation of all buildings, plant and equipment used in connection with such searching, exploration and drilling at rates to be agreed with the Central Board of Revenue based on the useful life of such buildings, plant and equipment.

NOTES:—(i) We are primarily considering the normal position where the enterprise is actually producing oil such as occurs in our own case. Any capital expenditure on tangible assets, or rights other than the buildings, plant and equipment mentioned in (b), e.g., the capital cost of concessions or of any mining or leasehold rights, etc., would not be deducted in computing profits but would be included in the expenditure ranking for amortisation under the optional Cost Depletion Allowance described below.

(ii) In the case of an enterprise which had not found oil and thus had never yet become a producing company the intangible prospecting expenditure and the depreciation on prospecting equipment would form part of the expenditure ranking for Cost Depletion Allowance. During this period, however an option should be granted such that where the prospecting rights to any area were abandoned then that part of the intangible outlays, etc., which related to that abandoned area could, at the taxpayer's option, be deducted in computing the profits from any other form of income from dealings in oil in the year of abandonment, the expenditure being *ipso facto* excluded from ranking for the Cost Depletion Allowance. When, however, the enterprise found oil and became a producing oil concern, the treatment outlined in (a) and (b) above would be followed.

B. To compensate for the wasting nature of the deposits of oil or gas and to encourage the hazardous and heavy expenditure incurred in prospecting therefor—the producing oil concern should be given in every year the alternative of

EITHER

- (1) A Percentage Depletion Allowance equal to not less than 25 per cent. of the value at the Well-head of the crude oil or natural gas actually produced (as determined for purposes of Government Royalty) limited however to a maximum of 50 per cent. of the net profits attributable to the production of the oil or gas.

NOTE:—The allowance thus represents an incentive based directly on the value of the indigenous oil produced, exempting part of that value from taxation since it is derived from a wasting asset. The overriding maximum limits the allowance to one-half of the excess of the value at the Well-head of the crude oil or gas over the cost of production, exclusive of the cost of

prospecting and drilling for further supplies in other areas.

OR

- (2) A Cost Depletion Allowance equal to that part of the balance of any tangible or intangible expenditure not otherwise allowed for taxation which the total units of oil or gas sold during the accounting year bears to the total estimated units of oil or gas likely to be obtained from the mineral deposits being worked calculated at the beginning of that year.

NOTES:—(i) The tangible and intangible expenditure ranking for this Cost Depletion allowance would initially consist of

- (a) Intangible prospecting expenditure and depreciation on equipment applicable to the periods before any commercial production commenced—less any part thereof allowed for taxation under the optional claim for abandoned areas. See Note (ii) under A above.

- (b) All Capital expenditure on tangible assets and rights for which no depreciation has been allowed or is available—whether incurred before or after commercial production was commenced.

The total expenditure would gradually be amortised as outlined in Note (iii) below.

(ii) The option under (2) would enable an enterprise which incurred heavy prospecting expenditure and then found only a small quantity of oil to deduct annually the correct proportionate part of such outlays in computing its taxable profits.

(iii) In every year after commercial production started the actual allowance granted or the notional allowance due (if the option under (2) was not exercised) would be deducted from the residue of expenditure ranking for allowance to arrive at the balance carried forward for subsequent amortisation.

3. (a) The Company's representatives were requested in this Supplemental Memorandum to furnish evidence in support, or otherwise justify the rates and basis of any depletion allowance they recommended. Whilst it will be appreciated from the information contained in Appendices I and II that the governing factors are such as to render the mathematical justification of any rate impossible, two aspects have an important bearing on the considerations of the rate and basis to be adopted.

One is that any oil produced is the realisation of part of a wasting asset, and the second is that the geographical location, or the geological situation of oil can materially affect the costs of production, and therefore, the rate of profits to be derived in relation to volumes handled.

(b) It is submitted that the experience of Governments and the Industry in other countries where indigenous production of oil is a flourishing business do furnish indications as to what is a reasonable rate. The United States of America and Canada are both countries with substantial industrial and agricultural activity as well as having a large indigenous oil production, and the last mentioned could not have been achieved without the taxation treatment of prospecting expenditure and granting of the incentives outlined in this, and the original Memorandum submitted by our Company.

4. (a) In the United States the percentage depletion allowance is calculated at 27½ per cent. of the value of

the crude oil at the Well-head (ignoring the costs of production), but this allowance is limited to an amount equal to 50 per cent. of the production profit ascertained by deducting from the Well-head value the costs of production, exclusive of prospecting expenditure in other areas.

(b) In Canada the depletion allowance is calculated at 33½ per cent. of the net profits reasonably attributable to the production of oil or gas.

(c) From the point of view of the oil industry, the American method has the merit that the allowance is primarily based on the quantity and quality of indigenous oil actually produced irrespective of the cost of production. Clearly such a basis is more likely to attract the appropriate risk capital and from the Government's standpoint has the definite advantages of linking the maximum allowance to indigenous oil actually produced.

It is clear that the Governments of these two countries have recognised the hazards involved in searching for oil, and that any oil deposits found were a wasting asset, and were convinced that the rates of Depletion Allowances granted provided an appropriate incentive to attract capital to develop a thriving indigenous industry.

It may be added that the Depletion Allowances are granted in the U.S.A. to other extractive industries but these are all at lower rates. The following (which is not an exhaustive list) shows the present rates of Depletion Allowances granted to other industries:—

Percentage of gross Income allowed for Depletion.	Extractive industry
5%	Sand ; Gravel ; Clay ; Granite ; Marble
10%	Coal ; Asbestos
15%	All Metal Mines ; China clay ; Phosphate rock ; Potash
23%	Sulphur

The above percentages accord closely to the geological hazards and risks of the relative industries, and establish that oil is recognised as entailing the greatest risks of all.

The geological risks in India are no less than in Canada and U.S.A. whilst the need for indigenous production in India is more clamant, and unless adequate incentives are provided it is unlikely that capital will be attracted. Moreover the geographical position of India entails much higher outlays for prospecting operations due to the costs of bringing the specialised equipment and stores from overseas and the necessity of maintaining larger stocks thereof.

There is set out in Appendix I a description of the type of Prospecting Expenditure incurred by an oil producing concern and the marked contrast between prospecting for oil and other minerals. This Appendix also contains the grounds for the Company's proposals and the reasons against amortisation of Prospecting expenditure.

Appendix II deals with Depletion Allowances, outlining the grounds for granting this incentive and that it should apply to the whole Industry.

During the course of the Meeting with the Commission a discussion arose on the taxation treatment in America of Intangible Drilling Costs and their relation to the Cost Depletion Allowance available in that country. Appendix III contains some notes on this matter together with a simplified example.

APPENDIX I

Prospecting Expenditure

1. It should be made quite clear at the outset that prospecting expenditure in the oil industry differs markedly from prospecting expenditure incurred in any other industry engaged in extracting minerals such as copper, coal, iron ore, manganese, etc. In the case of other extraction industries the geological possibilities of any area are much more readily ascertainable so that relatively smaller expenditure is incurred before extraction can begin, and the certainty of finding the mineral concerned in commercial quantities is much higher. The difference arises partly from the fact that a solid mineral, once formed, stays where it is, whilst oil migrates from its place of origin for distances measurable in miles until it becomes trapped in some suitable geological formation. It is also due partly to the fact that other minerals are worked mostly from, or within a few hundred feet of the surface, and only exceptionally at greater depths. The search for oil is by contrast the search for a mobile substance which may be 10,000 feet beneath the surface with absolutely no surface evidence to guide the prospector.

Furthermore in the case of oil the areas needing careful survey are enormously greater than the few square

miles in which oil may ultimately be found relatively far greater than the areas that have to be surveyed in prospecting for any other mineral. Moreover even if oil should be found, there is no certainty that its situation geologically, or the quantity found will permit or justify commercial production. Finally the reserves of other minerals are throughout extraction capable of more accurate assessment than is normally ever possible in the case of oil.

2. Although the subject matter of this, and the two following paragraphs were discussed at the Meeting, members of the Commission may wish to have before them a short description of the nature of the prospecting expenditure incurred by an oil Company. This falls into two distinct parts—

(b) The test drilling for possible deposits of oil at localised sites.

(b) The test drilling for possible deposits of oil at localised sites.

3. The geological and geophysical search represents the collection of data by various forms of survey to enable a geological map to be compiled of the manner

in which the rock strata below the surface over the wide area is built up with a view to ascertaining whether it contains places where the structure is in such a form as may possibly contain oil. There can be no certainty that when the data have been compiled they will show that suitable formations exist below the surface justifying the drilling of test wells, and indeed very many individual surveys lead to the result that there is no objective for drilling. In such a case the survey work, which is expensive, yields no return whatsoever. Thus there is no relationship between the amount of expenditure incurred on geophysical searches and the certainty that oil will be found, and as already stated, the surveys are expensive and extend over very large areas.

4. When, however, the data collected show that possible formations exist justifying the drilling of test wells such expenditure is then incurred at these sites, again with no certainty that the drilling will result in finding any oil, or oil in quantities and conditions in which it can be commercially workable.

In certain rock formations a well drilled within, say 500 yards of a successful well, may be "dry" or fail to produce oil in commercial quantities.

Experience in the United States where so much oil has been found shows that 88.9 per cent. of exploratory wells are complete failures; 9.0 per cent. find some oil but nothing of commercial value; leaving only 2.1 per cent. for fields which are commercially workable, of which at least three quarters are however minor fields which do little more than pay for the cost of discovery. This means that in America only one well in 50 finds a workable oilfield and only one well in 200 or 250 finds a fairly large oilfield. These figures are taken from a paper by the wellknown U.S.A. geologist, F. H. Lahee published in the Bulletin of the American Association of Petroleum Geologists for June, 1953, vol. 37, No. 6, pages 1193 to 1210.

The U.S.A. discovery rate may be taken as representative of the conditions in most of the World including India, but it should be added that the Persian Gulf area is an important exception. The success ratio in that region has so far been much more favourable to the prospector and the geological evidence points to vast reserves of Middle East oil being available for production. This factor may tend to operate as a potential deterrent to prospecting in India and other areas.

APPENDIX II

Depletion Allowances

1. It is recognised that, if the taxation treatment of prospecting expenditure outlined above is accorded, the granting of a percentage depletion allowance represents largely a taxation incentive.

2. The grounds for the granting of such an incentive are:—

(a) The prosperity and well-being of any nation and the ability of such a nation to strengthen its economy and maintain or raise the living standards of its population can be very largely affected by the successful and continuous development of its natural resources.

(b) Owing to the importance of petroleum products in world trade, the development of any crude oil or natural gas forming part of its own natural resources can form a very important factor towards the improvement of a country's economy.

(c) Oil, however, has not only to be discovered but, having been discovered, has to be extracted from the earth. The searching for and finding of oil involves much heavier and more hazardous expenditure than for any other natural resource. As even on test drilling alone there is about one chance in thirty of finding oil or gas in commercial quantities, it follows that the large sums of money necessary will only be obtained by attracting new capital, or by encouraging the application of profits from existing indigenous production to this end.

(d) Even when an oilfield is discovered, whatever the extent of the deposits, production difficulties can be encountered curtailing the period of commercial operation such that the money spent on prospecting may not even be recouped. The Badarpur oilfield in Assam was worked for 18 years until it was exhausted, but no profit was made.

(e) Because the risks involved in this search are so substantial it is obviously in a country's interest to attract capital and encourage the application of profits within the industry to further prospecting. Experience does not show that the allowance of prospecting expenditure as a deduction in computing tax-

The conclusion to be drawn is that if allowance is made for the discovery of both oil and gas, it is a fair presumption that 1 well in 30 will on the average find an oilfield or a gasfield which is workable (although more often than not the field is but a small one). Thus, even in a country like America with a long history of oilfield development and wealth of experience, the odds are heavily against a test well being successful.

5. The foregoing establishes the absence of any relationship between the amount of exploration expenditure and the discovery of oil which contrasts markedly with the position in any other extractive industry. Such expenditure, however, represents the search for the raw materials of the Company's business. Normally where expenditure is incurred, after a business has commenced, in seeking and obtaining stocks of raw materials, such outlays are a proper deduction in computing profits even if they should involve a comprehensive organisation for the purpose. The Company, therefore considers that, as these outlays are clearly expended in the normal course of its trade, the case for treating all such intangible expenditure as a revenue expense, as and when incurred, is overwhelming.

By the same principles depreciation is properly and clearly allowable on the capital equipment used in connection with the searching and drilling for further supplies of the Company's raw material.

6. It was suggested during the discussion with the Commission that prospecting expenditure of a producing concern might be amortised either over a certain period of years or over the period of production. The previous paragraphs, however, show clearly that with no certainty that such expenditure will find oil it would be unreasonable, and in fact be a disincentive for the amortisation to be given over a period of production which may never materialise. Nor is amortisation over a period of years considered reasonable in the case of the oil industry having regard to the nature of the outlays. The prospecting expenditure would appear to be analogous to Scientific Research (*vide* Section 10 (xii) and (xiv) of the Income Tax Act) and since the intangible outlays claimed do not include any capital equipment or rights they should be treated as an expense as and when incurred, the capital equipment being depreciated as already mentioned.

able profit: is of itself sufficient to encourage the substantial expenditure necessary if the potential benefits outlined in (a) above are to be achieved. It is only by creating fiscal conditions in which those bearing the risks of searching for oil will be entitled to a return after taxation adequate for their investment that is achieved. With present high rates of taxation this can be made possible by granting of special allowances free of tax to the oil industry. Otherwise overseas oil companies will tend to invest their capital, or apply their profits in prospecting in those countries where additional incentives are granted, limiting investment in India to Refineries and Distribution assets to handle imported oil products.

(f) The Governments of other countries, notably the United States of America and Canada (which together produce 53 per cent. of the World's production) recognising the enormous advantages to be gained from a thriving indigenous oil industry and also the desirability of encouraging the expenditures necessary to achieve such a position have by varying methods accorded appropriate treatment of this expenditure and have granted definite incentive allowances for taxation purposes.

3. The foregoing shows that the depletion incentives are claimed partly on account of the wasting nature of any oil found, and partly on account of the heavy and hazardous expenditure in searching for oil.

Clearly therefore the taxation incentives for the oil industry should be the same for all concerns, all areas and all production. The hazards of prospecting for oil are such that there can be no finality in any assessment of the position for any area. Differentiation could result in encouraging exploration in areas where no commercial oil may actually exist at the expense of other areas where undiscovered oil may actually lie or of oilfields requiring development. Regard must be had not only to the possibilities of discovering commercial oil in an area but to the cost of discovering, producing and of transporting to the nearest available market any oil found; these costs vary widely and unpredictably between one oil field and another and a system which could result in the grant of depletion allowance to a

cheap oilfield whilst denying it to a costly one would clearly be unsound. Again the granting of such allowances to one oilfield and not to another may encourage the taking of a higher production from the one at the expense of the other; an established oilfield might be abandoned earlier if it did not receive the allowances.

Differentiation could thus result in the loss of available oil resources. Any suggestion of discrimination between competitive interests in the industry has been avoided in the U.S.A. and Canada and here again it is felt that the methods and successful experience in those countries provide the surest guide to sound practice.

APPENDIX III

Taxation—Treatment in America

1. During the course of the discussion reference was made to the taxation treatment in America of Intangible Drilling and Development costs and their relation to Cost Depletion Allowances. The following notes and example as to the position in America may be of assistance to the Commission.

A. Depletion Allowances

- (1) The taxpayer has the option in any year to select either
 - (a) the Percentage Depletion Allowance or
 - (b) the Cost Depletion Allowance for each mineral property.
